Until lately Diderot has fared badly at the hands of translators, who have either betrayed him or abandoned him. Mr. John Morley's translation of the 'Neveu de Rameau,' appended to his volumes on 'Diderot and the Encyclopædists,' was the first adequate rendering into English of anything of Diderot's. The present translation of the 'Paradox' by Mr. Pollock is worthy of its immediate predecessor. Mr. Pollock has an advantage over most translators, in that he really knows thoroughly and well both languages, the one from which as well as the one into which he is translating. His success is the more praiseworthy, since Diderot is by no means as easy to translate as most Frenchmen. He has, moreover, added brief and sufficient explanatory notes, in which he has availed himself of the learned labors of the editors of the recent complete edition of Diderot, correcting their errors and supplementing their omissions wherever it has been necessary. Mr. Pollock's volume is printed as carefully as it has been edited, and its antique type and rough paper are a delight to the eye and the hand of the book-lover, although, on behalf of the general reader, we feel bound to protest against the use of long s's. Diderot's 'Paradox' is to the effect that the actor, like any other artist, must be primarily a thinker and observer, and that he need not at all feel the emotions he simulates on the stage. He declares that the man of sensibility is a poor artist; that the great actor must be cold and calm, and that "he must have in himself an unmoved and disinterested onlooker." He tells us that "extreme sensibility makes middling actors; middling sensibility makes the ruck of bad actors; in complete absence of sensibility is the possibility of a sublime actor." An actor "must have, consequently, penetration, and no sensibility—the art of mimicking everything, or, which comes to the same thing, the same aptitude for every sort of character and part." Diderot goes on to prove his case, giving many examples to show that the artist must always remain master of himself, and must never suffer himself to be carried away by the whirlwind of his passion. He accumulates instances of men "reduced at one moment to flat stupidity by the sensibility, and the next rising to sublimity by the self-possession following the stifling of" their "sensibility."

The preface which Mr. Henry Irving has prepared for Mr. Pollock's translation is interesting, like his acting, like which, again, it cannot be accepted without criticism. In his discussion of the French critic's argument it seems to us that he is not quite fair—or, say, is less acute in his analysis than we had expected. He wastes words in an attempt to explain Diderot's attitude by assuming that he was "thinking of the stage of Racine, and not of the stage of Shakspere." This is not quite the fact; Diderot was too piercing a critic to pause at the surface of the contemporary French repertory, as his many allusions throughout this very dialogue serve to prove. His theory is of a more general application; and it is as true of the acting of Shakspere as of the acting of Racine, no more and no less. But Mr. Irving succeeds to perfection in showing to what extremes Diderot forced his theory; and he adduces the evidence of Talma to controvert Diderot. The fact is that Diderot's was at all times a militant criticism. His attitude is ever that of the advocate, and never that of the judge. He was unable to throw off his habit of polemic discussion even when considering a naked question of art. Moreover, he made no effort to disguise the fact that he was guilty of overstating his case.

"Sensibility" in Diderot's day was a much-abused and overworked word, just as "emotional" is nowadays. It was a common belief then—and the belief is not altogether dead now, in spite of Diderot and Talma and Lewes and M. Coquelin—that the actor should abandon himself to the situation, and should rely for his effect on the emotion of the moment. Talma himself gave in to this heresy in his youth, and so did M. Mounet-Sully. But it is easy for Diderot to show us what Talma and M. Mounet-Sully soon discovered by themselves, that the actor's reliance on "sensibility" and on his "emotional faculty" is a leaning on a broken reed. Diderot even goes to the other extreme, as we have seen, and declares that an actor should have no emotion at all. Here, of course, he is in error. But as between the two opposite positions—Diderot's, denying the possession of passion to the great actor, and the opposite, allowing the great actor nothing but passion—it is impossible to doubt that Diderot's position is very much the nearer to the truth.

In his posthumous book of lectures on the 'English Novel' the late Sidney Lanier records the fact that "Charlotte Cushman used often to tell me that when she was, as the phrase is, carried out of herself, she never acted well. She must have her inspiration; she must be in a true *raptus;* but the *raptus* must be well in hand, and she must retain the consciousness, at once sublime and practical, of every act." Mrs. Kemble, too, going back to her first appearance as *Juliet*, describes the curious dual state in which she found herself—at once possessed both by the feelings of *Juliet* and by those of Miss Fanny Kemble. "To form a great actor like Lekain the union of sensibility and intelligence is required," says Talma; adding that "the actor who possesses this double gift adopts a course of study peculiar to himself." He is perpetually observing himself and others, and attempting to reproduce typical effects of feeling. He is all the time taking stock of his emotions, not to call them again into being, but to imitate them externally. As Diderot says of the good actor, "at the very moment when he touches your heart he is listening to his own voice; his talent depends not, as you think, upon feeling, but upon rendering so exactly the outward signs of feeling that you fall into the trap." So deceptive is the art of the actor to those who have not familiarized themselves with its methods, that most play-goers, and indeed most professed dramatic critics, are inclined to overestimate the actor's native ability and to underestimate his acquired faculty. Great actors, like all other great men, are born, not made; but having the gift, they become great only by incessant study. The definition of genius by the English novelist as the art of taking pains is particularly appropriate to the histrionic calling. Nowhere is a fiery, untamed genius of less use and of less duration than on the stage. "For heaven's sake, have a little less genius and a little more talent," said M. Emile Augier to M. Mounet-Sully, at a rehearsal nearly ten years ago; and M. Mounet-Sully's high artistic position now is due to his having taken the advice to heart and forsworn the false gods who led him astray. Edmund Kean, who is sometimes taken as a type of the "natural" actor, was so methodical, and took the mechanism of his art so seriously, that he always paced the stage of any new theatre he played at, in order to reduce in exact proportion to one side of the house the rush of his rapid entrance in moments of tense and hurried emotion. David Garrick, like Edmund Kean, was in his day hailed as a reformer, as one who preached a return to Nature; and Garrick was even more precise and exact in his methods than Kean.

The time when the actor can let loose his feelings, and call up the utmost of emotion and experience, is when he is studying his part—"composing" it, as the French call it. Then he feels, observes, records, repeats, and combines. Even after he has once acted a character he may modify minor details here and there, heightening a color or lowering a note. But when his "reading" of the part is once fixed and determined, and the "business" well devised and arranged, there ought to be no capricious change, and there is then no need for the actor of sensibility always to "feel the character," for then, as Diderot suggests, "he must wear himself out by excess of soul."

In the Land of the Lion and Sun; or, Modern Persia. Being Experiences of Life in Persia during a Residence of Fifteen Years in Various Parts of that Country, from 1866 to 1881. By C. J. Wills, M. D., late one of the Medical Officers of Her Majesty's Telegraph Department in Persia. London and New York: Macmillan & Co. 1883.

THE author's reason for calling his book "'The Land of the Lion and Sun' is, that the lion and sun are the national emblems of Persia, while the second title alone, 'Modern Persia,' would have suggested an exhaustive and elaborate array of matter which is beyond the scope of this work." The work is not meant to be a description of all Persia, nor a full description of any part of it; it contains no geographical sketches, no statistics, no consecutive observations on administration and government, no ethnological sketches, no history. In fact, the author seems to presuppose an ample knowledge of Persian things on the part of his public, and to write for such readers only as are desirous, for some special reason of their own, or from an insatiable avidity for general information, to obtain very minute details about Persian topics not yet exhaustively treated by European travellers. To such readers his large volume, crammed with detailed accounts of his own every-day experience in and around Teheran, Hamadan, Kermanshah, Ispahan, and Shiraz may prove satisfactory; others it will repel or tire out by its copious and often tedious talk about things insignificant and unattractive. Dr. Wills abstains from generalizing almost as scru-

pulously as from imparting knowledge of Asiatic affairs which educated people ought to, but do not always, possess, and leaves the reader "to make his own reflections"—generally leaving him alone with his ignorance. We believe we do the doctor full justice when we say that his book contains much that will be justly appreciated by the few, together with more that nobody cares for, and that, on the whole, it is a very conscientious but far from amusing performance. The following fragment of a sketch of an Armenian bishop, with numerous explanations interspersed, may be here presented as characteristic, though in style and general attractiveness considerably above the average of the author's descriptions:

"The little bishop is a gouty man, and does not indulge, though there are legends that in his youth his potations were pottle deep; he does not even smoke, but he snuffs—a thing that most of the old people in Julfa do. A jovial old man in a skull cap and flowing black robes, he insists on regaling us with gez—a sort of sweetmeat, prepared from the gezanjebine, a mawkish exudation from a plant found in the desert near here, and akin to manna; it is mixed with sugar and made up into round cakes with almonds or pistachios. It is impossible to break these cakes with the finger; they will bend freely, but on striking them with a hammer or another cake they fracture at once. Ispahan is celebrated through Persia for this sweetmeat, and large quantities are sent away in every direction. In Julfa and Ispahan the gez is always offered on the arrival of a guest, and urgently pressed on one; it is considered impolite to refuse. The flavor is merely sickly sweet, and it sticks to the jaws like butter-scotch; it is white in color, and very cloying. The monk, too, always has a glass of good old Kishmish wine for his friends. The Kishmish grape is the smallest in Persia; it is a bright yellow color, and very sweet; it is, when dried, what we call the Sultana raisin. The wine is a golden yellow, delicious when quite new, but terribly heady. It is a great favorite with the Armenians, as it is quickly intoxicating. As a rule it will not keep well, but when it does it is not to be despised. A glass of arrack is offered as an alternative, and this is more suited to the native taste; it is, as a rule, what is called in India 'fixed bayonets.'"

Dr. Wills's life in Persia was uneventful, but his connections, as physician, with all classes of society afforded him sufficient means of observation. He moved much among Armenians, whom he is not at all inclined to admire; was often shocked by the abject degradation in which the Jews are kept; and became familiar with all shades of practical Mohammedanism, from that of the howling dervish to the radicalism of the freethinker. Concerning some "sectaries of the Baab," whom he calls an impostor, and of whose communistic religious tenets he says only that they are very difficult to get at, he relates the following: In 1880 a priest of Ispahan was denounced by his wife as a Baabi. Thrown into prison by order of the Governor, a son of the Shah, he avowed his Baabism, and refused to retract, while denying the crimes laid to his charge. He was led in chains to a place of execution, and bastinadoed, but offered his life if he would curse Baab. He replied: "Curses on you, your Prince, your King, and all oppressors," and suffered death. A few days after his execution three brothers, intimate acquaintances of Dr. Wills, were arrested as guilty of Baabism. As near relatives of the former Imam-i-Juma, or high-priest, whose protection was all-powerful, they had, in fact, made no secret of their heterodoxy. This was, however, not the real cause of their arrest. The new Imam-i-Juma owed them a large sum of money. They were sent for, and required to relinquish the claim on penalty of being denounced and executed. As they refused to remit even a portion of the debt, the debtor made "a proposition . . . to the Prince that the whole of their property should be confiscated by him, and they should be accused of Baabism and executed. This was agreed to." They in vain protested their innocence, the youngest brother even cursing Baab as proof of his orthodoxy. The English missionary in Julfa, the Assistant Superintendent of the Telegraph, our author, and a few others, fruitlessly attempted to save the three victims of priestly and princely avarice. The Prince showed himself furious. He asked the doctor, "What would your Prince of Wales say if *he* were interviewed, and letters written to him about confessed criminals by obscure Persians?" The city being in great excitement, the throats of the two elder brothers were cut in prison, and their bodies flung into the square; the youngest brother was spared. The high-priest shared the plunder with the Prince. "Such was Persia in 1880," remarks our author here, and he has many other instances of cruel oppression and fierce barbarism to relate. And if such is the government and the priesthood of Persia, what must its people be? To our pleasant surprise, "after a residence of fifteen years in various parts of the country," Dr. Wills—this time broadly generalizing—presents these among the main characteristics of the people:

"The character of the Persian, as it appears to me, is that of an easy-going man with a wish to make things pleasant generally. He is hospitable and obliging, as honest as the general run of mankind, and is especially well disposed to the foreigners. Home virtues among the Persians are many; he is very kind and indulgent to his children, and as a son his respect for both parents is excessive. . . . An undutiful son or daughter is hardly known in the country. No act of serious import is ever undertaken without the advice of the mother. . . . And by the very poorest the support of their parents would never be looked on as a burden. Respect for the aged is universal. . . . The peculiar honesty of the Persian servant toward his master in respect to his goods and chattels has been previously remarked; and in commercial morality, I fancy that a Persian merchant will compare not unfavorably with that of the European generally. . . . To the poor, Persians are unostentatiously generous; most of the rich have regular pensioners, old servants, or poor relations, who live on their bounty; . . . charity, though not organized, is general. . . . Only the upper classes and the natives of towns among the military and servant class are in the habit of indulging in intoxicants, and unchastity is confined to the females of these classes; . . . the Persian woman compares favorably with her European sister in this respect. . . . Cruelty is not a Persian vice. . . ."

Practical Notes on Etching. By R. S. Chattock, Fellow of the Society of Painter-Etchers. Scribner & Welford. 1883.

THESE chapters on etching, the author tells us, appeared originally, for the most part, in the pages of the *Etcher*. Gathered up into this form they make a very handsome thin octavo volume of seventy-two pages, which contain much entertaining and instructive matter relating to the etcher's technical processes. For those who wish to understand these processes the book will be found very serviceable, as it not only gives such information as is contained in treatises like those of Lalanne and Hamerton, but a good deal in addition concerning minor details, the want of which has caused many embarrassments to the solitary etcher. For instance, respecting grounds, the author remarks that the main desiderata are that they should be firmly adhesive to the metal, absolutely impervious to the acid, hard enough to insure a clean line, and soft enough to allow the perfectly free play of the needle. Many different grounds, each composed of many ingredients, are used; but they all involve more or less trouble in their preparation, and do not all work perfectly well. Mr. Chattock, desiring one that should be as simple as possible consistently with thoroughness and efficiency, found that a mixture of asphaltum and wax answered every purpose in his own practice. It has, besides that of simplicity, the advantage of being dark enough to show the lines plainly without being smoked, and pale enough to show them still when bitten by a hydrochloric mordant, which darkens the copper as it bites. A useful device for preventing too rapid evaporation, when the ground is applied in the form of a solution, is described. It consists of a pane of glass so placed in a wooden frame as to be raised about a quarter of an inch from a level board on which it rests. The plate to be bitten is placed on the board under the glass, which being lifted, the solution is poured on. The glass is then let down, and the board is gently tilted in all directions till the solution has reached every part. The thin stratum of air between the plate and the glass is not enough to dry the ground till after this process is easily completed.

Very full instructions are given for preparing and using the etching-needle, and the methods of stopping out, rebiting, and working-in the acid are also fully treated. We think the author, though he has the concurrence of nearly all modern etchers, makes too much account of the effects obtained by these means. The fine gradations thus secured do not seem to us qualities that ought to be sought to any great extent in etching. Good and expressive lines, with comparatively little variation of depth (though often with considerable variety of effect consequent upon skilful use of the needle), are characteristic of the class of etchings which seem to us best; and the energies of etchers would, we think, as a rule, be more usefully spent in striving to render their lines expressive than in seeking these refinements of tone, which properly belong to other processes.

The chapters on Mordants, on Dry-Point, on Printing and Inks, and on Papers are all clear and sufficient, but the author argues weakly and erroneously in favor of the *retroussage* method of printing. That method is one of the chief obstacles to progress in modern etching. Plates thus softened and disguised by the printer pass, with the not yet very discriminating body of both artists and public, as artistic, which would not be much admired if they had to depend upon the merits of the etcher's actual work upon them. We regard this method as a temporary fashion which will ere long run its course. In fact, *retroussage* is simply a trick of execution, and everything of this nature is intrinsically bad, as well as foreign to good and honorable art. Whatever effect, or suggestion, of light and shade an artist may desire in a copper-plate—beyond such as his actual lines will produce—should be honestly wrought in mezzotint or some other legitimate process.

The text is accompanied by eight etchings by the author, which vary in quality, but do not, any of them, reach a high degree of merit. The frontispiece, "The Barn-Door," is like school-boys' work in point of drawing. "The Larch Wood," facing page 64, is pleasantly suggestive, but it is not strong work. "The Brook," facing page 32, is conventional in execution, and inharmonious in chiaroscuro. The up-stream passage in shadow (got largely by *retroussage*) forms a too heavy spot of dark in relation to the rest of the design—which is wrought in comparatively open line and clean-wiped. Still, the subject is a good one, and there is some clever work in it. The open line-work shows about as much power of sketching as is possible where the essentials of drawing are no more keenly felt than they are at present by average etchers. The best plate in the series is "The River Llyfuant," a dry-point, facing page 48. This is in some respects charming, and is wrought with much tenderness and skill.

Man before Metals. By N. Joly, Professor at the Science Faculty of Toulouse. [Vol. xlv. of the International Scientific Series.] D. Appleton & Co. 8vo, pp. 365, with 148 illustrations.

THIS book contains nothing new, and its "excuse for being" is to be found in the simple and methodical arrangement of well-known facts, and in the candor with which their bearing upon certain mooted points is discussed. Regarded in this light, the work is entitled to commendation even from those who do not fully agree with the author as to the antiquity of man. As a rule, however, his conclusions upon this subject will be generally accepted, though our ability to decide upon the validity of his reasoning is at times impaired by the omission of what may eventually prove to be essential facts. A notable instance of this occurs in the chapter on "Tertiary Man." Justly enough, this question is said to be still open; and being so, it was clearly the author's duty to have aided us as far as possible in coming to a conclusion of our own, by giving us all the material facts of which he was in possession. This, however, is not done; for in omitting all mention of the discovery of stone implements in the pliocene beds of Portugal and California, he leaves us, so far as he is concerned, without the knowledge necessary to the formation of a correct opinion. That the omission was not due to ignorance, and was not the result of an attempt to suppress the truth, is evident from the frankness with which the subject is discussed. Whether it proceeded from a lingering doubt as to the authenticity of these finds, or was simply an oversight, cannot, of course, be determined. In either event, it is inexcusable, since it is upon the genuineness of these two finds that the question of man's existence in pliocene times mainly rests; and to omit all notice of them when investigating this point, or when discussing the evidence of his appearance at a still earlier period in the world's history, is virtually to cut away the rounds of the ladder which we are expected to climb.

In treating of prehistoric man in America, and especially in the few pages devoted to the consideration of the mounds and mound-builders, our author is far from satisfactory. In fact, it would be hard to find a greater contrast than exists between this portion of his work and that in which he deals with the river-drift and bone-caves of France, the peat-mosses and kitchen-middens of Denmark, and the lake-dwellings of Switzerland. In the one case he is evidently at home, and his summary of the evidence, drawn from these sources, of man's existence in the earliest quaternary times is clear and conclusive, while in the other he is completely at sea; and though he defers to authors of acknowledged reputation, like Squier and Morton, yet his facts seem to have been selected at random, without much regard to their bearing upon the main question, or to the light thrown on them by subsequent explorations. As a result, he has given us a piece of patchwork, in which the inaccuracies are so numerous as to make it practically worthless either for purposes of illustration or argument. Some, perhaps a large majority, of these errors are of but little moment, though others, like the statement that many of the mounds "seem to date from a period anterior to the neolithic age of the New World," are more serious and far-reaching in their character. This assertion, it is true, is so qualified as to reduce the number of these palæolithic mounds to an insignificant fraction; but even in this modified form the statement cannot be passed over, since it is an established fact that nothing has yet been taken from the mounds of the Mississippi Valley that indicates a different phase of civilization from that which the red Indians, who held this region at the time of the discovery, are known to have reached: nothing which they could not have made, or might not have bought from their neighbors in Mexico or on the Atlantic coast, with both of whom they had more or less intercourse. As these same Indians are admitted to have been living in the neolithic age, this is, of course, a sufficient answer to the statement, though it does not, perhaps, enable us to identify them with the mound-builders. To do this, we must go one step further, and show that they built either some of these identical works or others of a similar character. Fortunately, this is not a matter about which there can be any doubt; and as no other people, so far as we know, have ever occupied this region, it is believed that we are justified in concluding that the mounds of the Mississippi Valley, of every sort and size, were the work of these same Indians, or of their immediate ancestors. All other inferences are denied us until it can be shown that at some time in the past this valley was held by a people other than the Indians, who built mounds, defended themselves behind earthen walls, and had reached that stage of civilization which, for the want of a better term, we are accustomed to call the neolithic, or age of polished stone.

In the second portion of the work—that which relates to primitive civilization—our author is seen to better advantage. The subject itself is one of never-failing interest, and it is treated in a manner that is at once entertaining and instructive. Instead of an exhaustive study, wearisome by reason of its details and suitable only to the special student, he has given us, under appropriate headings, short and comprehensive sketches of the origin and development of the arts and industries of quaternary man, and also of his religion, so far as he can be said to have had any. To do this successfully, a knowledge not only of the latest teachings of archæology, but also of the manners and customs of modern savages is requisite—the one being to some extent a complement of the other. In both these branches our author is proficient, and hence the satisfactory manner in which much of this part of his work is done. Of course, in an investigation of this character, covering such a wide range of subjects upon many of which opinions differ, errors of "omission and commission," or what are thought to be such, are almost inevitable. Vague statements, too, will creep in, and assertions of a seemingly contradictory character are not impossible. An instance of the former may be found in the denial of "extended commercial relations to tribes of the stone age"; and an example of the latter can be seen on pages 204 and 307, where the discovery of pottery is attributed to two different epochs or phases of civilization. Statements like these are ambiguities rather than inaccuracies, and, though they unquestionably detract somewhat from the value of the account, as given, of the development of civilization, yet in the present instance they do not necessarily weaken the force of the conclusion as to the gradual advance of the human race from a lower level of savagery to a higher plane of barbarism. Upon this point our author's position is believed to be impregnable, as it is the logical outcome of a series of facts, carefully chosen and stated with fairness and precision. Indeed, in this respect, as well as in the modesty with which these conclusions are announced, this work may well serve as a model. Debatable questions are treated as such, and in regard to those matters about which we know nothing, and are not likely ever to be any wiser, he does not hesitate to confess his ignorance. Such frankness would disarm criticism, even if there were points of difference more numerous and of more importance than can be found in the present volume.

Histoire de la Littérature Anglaise. Par Augustin Filon. Paris, 1883; New York: F. W. Christern.

WHATEVER may be their defects otherwise, French writers always have the art of saying things pleasantly. Here is M. Filon, who has taken a well-worn theme, has brought to its treatment neither the brilliant generalization of Taine nor the careful research of Beljame, who, moreover, not seldom trips in his facts, and seems to know some of his authors only by report; for instance, the ascription, more than once, to Marlowe of a tragedy of "Richard II." could hardly have been made by one who had read that ghastly scene at Berkeley Castle. Yet, for all this, he has a way of seizing the leading points, and of saying the *fin mot* upon occasion, so that we read his book with pleasure, and with a feeling that, at least in some points, our knowledge has been refreshed, and with no irritation at a few amiable *bévues*.

The history begins with "The Celtic Period," and opens with a statement that "the Cimmerians were driven by the Scythians from the shores of the Euxine Sea." One feels like crying, with Daudin, "Ah! passons au déluge"; but even granting that the Cymri of Britain were descendants of these Cimmerians, why their eviction should figure as a starting-point for English literature, rather than the Dorian migration or the Eugubine Tables, is more than we can see. The Celtic literature is rich and beautiful, but it is no more one of the "origines" of English literature than the Iroquois or Algonkin myths are the origins of American literature.

Extricating ourselves from this Cimmerian darkness, we come to the "période Saxonne," and here we meet evident signs that M. Filon does not know what he is talking about, and is far from clear as to what he means to say about it. What, for example, is the meaning of this? "If we take away manufactured words—words taken from the Greek or the Latin—which the progress of science and the developments of modern life have made necessary, the English is poorer than the Saxon, since one-fifth of the words in use in the time of Alfred have disappeared from the language." Does he mean that we English-speaking folk are now talking a language made up of four-fifths of the Alfredian vocabulary plus technical and scientific terms? What does he mean by saying that from the beginning of the fifteenth century, "henceforth the Anglo-Saxon calls itself the English"? We had been under the impression that the Anglo-Saxon never "called itself" anything at all, though some scholars, for reasons of convenience chiefly, prefer to call the form of English in use before the twelfth century "Anglo-Saxon"; but that the writers and speakers of that tongue called it "English" for six hundred years before M. Filon's date. But old English is not a strong point with our author, and it is hardly fair to bring him so closely to book. Of the results of the Norman Conquest, we should look to find him better informed; yet we do not escape a statement like this: "Comme la langue est le principal organe de la vie nationale, et le plus puissant véhicule des aspirations autonomiques d'un peuple, on [he is speaking of William and his immediate successors] proscrivit la langue des vaincus; on lui défendit d'exister." And William, who tried to learn English, and who issued many writs in English, but never one in French—!

Readers of early English will be inclined to stare and gasp at this description of Layamon's 'Brut': "Layamon écrit, au commencement du treizième siècle, dans le dialecte du Sud-Est, une triste compilation de Bède, de Saint-Albin, de saint Augustin de Canterbury, et de Robert Wace." However, we prefer to pass on, without

further criticism, to something of which we can speak more favorably. If any one wishes to test a Frenchman's qualifications to write about English literature, let him try him on the Elizabethans. The earlier periods are full of pitfalls and mantraps, and after the Restoration all is plain sailing. But if a Frenchman has so far widened his horizon beyond Racine, Boileau, and the *grand siècle*, to feel the passionate energy, the radiant imagination, the puissant language, the grace and tenderness of the Elizabethans, then we are pretty sure to get something good from him; and here M. Filon comes out very well. His criticisms are sympathetic and, in the main, good. His long and careful article on Shakspere is well worth reading, and shows a thoughtful study of each drama. Here is one good remark out of many:

"Lear, Macbeth, Othello, Hamlet, se ressemblent en un point. C'est la passion qui les mène; nul d'entre eux ne fait ce qu'il veut, nul n'a le gouvernement de lui-même. Bien au-dessus de nos têtes, le théâtre antique avait placé la fatalité; c'est en nous que la place Shakespeare. Il lègue cette idée au drame moderne. Avec Racine et Schiller apparaîtront d'autres héros qui personnifient la liberté humaine: conception fière et sublime, si elle n'est pas démentie par l'étude des faits intérieurs. L'avenir dira peut-être—si l'homme arrive à se connaître lui-même—laquelle de ces trois philosophies dramatiques est la plus conforme au vrai."

A sound thought, well put, and, to the present reviewer's mind, worth lumber-rooms of ingenious metaphysical cobwebs, to say nothing of that fatuous criticism that studies Shakspere with slate and pencil, and measures him by the statistics of "end-stopped" lines, and "run-on" lines, and "double-endings," and "weak-endings." It would be almost parallel criticism to judge the works of Mozart or Beethoven by counting the accidental sharps and flats.

Life on the Mississippi. By Mark Twain. With more than three hundred illustrations. Boston: James R. Osgood & Co.

MARK TWAIN labors under the disadvantages which attach to the position of a professional humorist. When he writes a serious book, the public receives it with a predisposition to laugh which interferes with its appreciation of what the author has to say. 'Life on the Mississippi' is only secondarily the work of a funny man. Primarily it is a descriptive and historical work, by an ex-pilot of the old Mississippi sort, intended to bring before us the contrast between the river as it is, and as it was in the days before the war, and before the great steamboat trade had been interfered with by the building of rival railroads. Many chapters of the book first appeared in the *Atlantic*. Probably by this time most readers of Mark Twain know that the odd literary *alias* selected by him came from the Mississippi, where "mark twain" was once the cry of the leadsman when he found that he had two fathoms of water. All Mr. Clemens's description of his pilot apprenticeship and of pilot life is interesting, and we take it for granted true, the veins of humorous exaggeration which occur in it having little or no connection with the general drift of the narrative. We have had occasion in these columns once or twice to refer to Mrs. Trollope's formerly discredited book as a probably veracious account of life in that part of America which she saw—a journey up the Mississippi constituted part of her American tour—and curiously enough Mark Twain, whose recollections of Mississippi life go back to the confines of the Trollope era in American development, speaks highly of her book and of her regard for accuracy in general. We have always believed that the real explanation of the storm of criticism which the book met with in this country lay partly in the fact that the headquarters of "culture" in America at the time was the East, while the part of the country that she saw most of was the pioneer West, of which the East knew little, but thought highly. Consequently, when she painted the West as she actually found it, the sensitive East was very much shocked and disgusted because the picture did not at all correspond with the Eastern view of what the West must be, and visited its displeasure upon the wretched author. At any rate Mark Twain vouches, as far as he can, for the truth of the picture.

The book will be found, as a record of a past phase of American life, both entertaining and valuable. The author is not only a humorist, but there is some purpose in his humor: as witness his account of the dreadful pass to which the worship of Sir Walter Scott and the attempt to introduce chivalry into real life brought the South. The best part of the book, however, is that which relates to the Mississippi pilot, a creature as extinct as the dodo.

La Légende des Siècles. Vol. v. By Victor Hugo. Paris: Calmann Lévy. New York: F. W. Christern.

WHAT can be said of this last volume of the famous "Legend" that has not been said of the four that preceded it? The same astonishment is felt at the unabated fury of the poetic fire still burning in the octogenarian breast, at the loftiness of some thoughts, clothed in noble language, made more luminous by the confused background of trivial phrases and incoherent exclamations. Victor Hugo adores Liberty—an immaculate, virtuous ideal, under whose rule every man will be perfect and there shall be no more suffering, no more crime or vice. Then, he believes honestly in God, the invisible spirit, all love and justice, who shall surely reward or punish us according to our deserts; but his romantic vocabulary cannot supply him with terms strong enough to express his hatred of the clergy—the Church is his bête noire, the embodiment of all that is vicious and criminal. He loves the people, and the vilest rascal will enlist his sympathy provided he belongs to the *peuple*: is he not one of the victims of oppression and fanaticism?

Such is the theme that he must develop throughout some three hundred pages of poetry, as he has done these last forty years in prose and verse; and we are tempted to say apologetically with Bilboquet, when some one criticised his solitary musician who always played the same note on his French horn: "Well, it pleases those who are fond of that note." Victor Hugo calls to his aid all the resources of the French language—and no modern writer has them better at his command. He juggles with words; they are the glittering tinsel with which he adorns deftly the merest skeleton of an idea. He excites himself to the highest pitch of indignation, hurling, the while, terrible epithets at the objects of his hatred. He soars so high that the mind can scarcely follow him, then, without transition, he drops into the merest commonplace, as if to remind us that he is but human after all.

The first piece in this volume, "Les Grandes Lois," in which he rejects indignantly Darwin's theory of the origin of man, is an eloquent declaration of faith. He appeals to the heart for arguments to prove the immortality of the soul, and tells those to whom science has not brought proof, but doubt:

"Le désespoir vous plaît, moi je prends l'espérance."

This poem, written in a lofty inspiration, contains many beautiful lines, worthy of the palmiest days of the author's fame. "Dante's Vision" is a vast conception of the Last Judgment, in which we find many beauties and many obscurities. The poem "Inferi" is in the same style. There are some pieces, of a more graceful turn, that are quite refreshing to read after this prolonged poetic nightmare. Such are "The Peasants on the Seashore," and a pretty little piece, without a title, in which "la petite Jeanne," Hugo's darling grandchild, gives him the reason why the cats eat the mice: "You see, grandpa," says she in conclusion, "if the mouse was the bigger animal, it would eat the cat." The allegory is transparent enough.

In conclusion, let us say that while this volume maintains Victor Hugo's claim to the title of first lyric poet of France, there is much in it that is weak, because not clear. The greatest claim ever made in favor of the French language is its clearness and freedom from ambiguity. We don't know that poetry is an exception; yet there are not a few people who think that what is incomprehensible must be sublime. An admirer of Hugo, being told that the sense of certain passages in one of his books was obscure, "You don't understand it," replied the enthusiast; "neither do I, but he knows what he means, and the time will come when it will be clear to all—it is the language of the future!" This prophecy may be a consoling thought to many who wish to admire, yet doubt.

Slavic and Latin. Ilchester Lectures on Comparative Lexicography, delivered at the Taylor Institution, Oxford. By Carl Abel, Ph.D. London: Trübner & Co. 1883.

THESE lectures—resembling in character the author's 'Linguistic Essays,' reviewed in No. 927 of the *Nation*—are four in number, treating of "The Slavification of the Finnish Area," "The Two Russian Languages," "The Russian Linguistic Conception of 'Gentleman' and 'Nobleman,'" and "The Linguistic Conception of Liberty in Russian and Polish as compared with Latin"; to which is added a brief supplement on "Egyptian Inversion." The titles have a slightly sensational sound, and one might suppose it was the lecturer's principal object to amuse his hearers. Far from it, his aim was to initiate them into the mysteries of "Comparative Lexicography, a sister science of Comparative Grammar," the formation of which he has "repeatedly endeavored to advocate"—witness his 'Linguistic Essays' and 'Coptic Researches.' If he speaks of the Russian conception of "gentleman" or "nobleman," he means to elucidate the national psychological grounds which bend the Russian mind to form a certain conception and no other. He endeavors to show you in another lecture that Great Russian and Little Russian—the idioms, in the main, of the northeastern and southwestern divisions of the Czar's empire, respectively—are distinct languages, reflecting the different psychological bases of two distinct nations, one—the larger and northeastern, whose centre is Moscow—originally almost wholly Finnic, but Slavified, and the other—centring around Kiev—purely Slavic. For, Dr. Abel thinks, "it cannot be too emphatically asserted that, on being properly investigated, the words, forms, and constructions of every language are found to display a comprehensive view of the universe, its things, qualities, and transactions, as conceived by each nation after its own peculiar fashion and style."

It is hardly necessary to state that the study of the psychological basis of "every language" is no light task, especially if "the systematic analysis of the dictionary," meaning "the scrutiny of each verbal notion under conceptual categories," is to be supplemented by "the examination of synonymous grammatical forms and

constructions." But it must be worth the trouble, as leading to the ultimate unfolding of the Griqua's and Gbandi's, Herero's and Eve's, "comprehensive view of the universe," which we cannot study from books as we do the Greek's or Hebrew's. Dr. Abel has undertaken a part of the task with a light heart. He has adopted a method, and believes he can sufficiently demonstrate it by "the comparative dissection of a few vocables." To us, we must confess, tasks of this kind appear tremendous; to him they are a scholar's play. Penetrating through all the windings and intricacies of linguistic evolution among an illiterate peasantry, he discovers deeply hidden reasons for things which *we* should deem more or less accidental, or at least dependent upon grounds so flimsy, irrational, or obscure as to baffle all inquiry. Here, for instance, are a few of his more interesting observations, derived from a close study of the two tongues and an ambitious analysis of the two national minds:

"Slavo-Russian knows only the word 'vrag,' a foe from innate evil disposition. Finno-Russian retains the ominous term, but sagaciously supplements it by 'nepriyátel,' an enemy from interest or other more transient motives; a man, in fact, who, under altered circumstances, may think fit to become a friend. . . . 'Sláva,' in Little Russian, 'talk, rumor,' in the more ambitious and political Great Russian speech is exalted into 'glory, honor.' 'Duch,' in simple Little Russian 'vapor, smoke,' in the literary development of Great Russia is raised to 'spirit.' 'Slútchai,' in Little Russian 'an unlucky accident,' in Great Russian, which has a pessimist proclivity, is used to denote *every* kind of accident, all accidents being in that language regarded as pretty sure to turn out more or less unlucky. . . . Again, 'divítysya,' in Little Russian 'to see,' in Great Russian, very much at variance with the classical injunction of *nil admirari*, adopts the more spiritual sense of 'to see and admire, to admire.' 'Golosíty,' in Little Russian 'to sob, to groan,' . . . in Great Russian merely denotes 'to talk aloud.' . . . A cloud in Great Russian is called 'óblako,' from 'óblekaty,' to cover; in Little Russian it goes by the name of 'χmara,' from 'χmúrity,' to darken. . . . Blood, in Great Russian called 'krov,' from a root designating moisture, in Little Russian is known as 'mazká,' from 'mazáty,' to smear. Marriage, which in Great Russian is described as 'svádba,' meaning probably abduction, in Little Russian rejoices in the more modern appellation of 'vesilya,' 'gladness, frolic.'"

It is, however, unfortunate for these efforts or flights of comparative lexicography that the language of the Poles, next neighbors of the Little Russians, like them pure Slavs, and by them separated from the Great Russians—Dr. Abel extends Little Russia as far as Novgorod—agrees on all the points mentioned except *slutchai* (which it has not), not with the neighboring purely Slavic tongue, but with the language which the lectures represent to be Finno-Slavic—that is, a Slavic language transformed by the Finnic mind. In Polish an enemy is denoted both by *wróg* and *nieprzyjaciel; sława* means glory; *duch*, spirit; *dziwić się*, to wonder; *głosić*, to announce aloud; a cloud is called *obłok* as well as *chmura;* blood, *krew;* marriage, *swadźba* as well as *wesele.* The sad fact about the speculations of our author is that they are just as hollow as they are pretentious and seemingly striking. We could prove this by scores of examples, but the above may suffice. His speculations regarding "inversion," both in sound and sense, are worse than hollow—they are mostly ludicrous. Thus, for instance, he asks in his argument on the subject, "Is not 'better,' though derived from 'bad,' the comparative of 'good'? Is not 'melior,' though derived from 'malus,' the comparative of 'bonus'? Is not 'worse,' . . . the opposite of its Sanscrit equivalent 'vara,' meaning 'better'?" These analogies would be very striking if correct; but *better* is not derived from *bad*, nor *melior* from *malus*, nor is *worse* the equivalent of *vara*—as good etymological dictionaries, no less than good sense, show. Doctor Abel uses excellent English in support of his theories, and displays a good knowledge of Slavic idioms, but his transliteration is abominable.

An Outline of Irish History, from the Earliest Times to the Present Day. By Justin H. McCarthy. Baltimore: John Murphy & Co. 1883. 12mo, pp. 134. [Also, in the Franklin Square Library.]

MR. MCCARTHY'S short history of Ireland is as good a sketch as could be expected within this number of pages. Written from a positively Irish point of view, it is at the same time fair and temperate in its tone, and accurate in its statements. Its principal defect is what we may call lack of emphasis upon the most essential points. There are three or four crises in the modern history of Ireland—the conquest by Elizabeth, the Cromwellian settlement, the eighteenth-century legislation, for example—which are so conspicuous as history, and have been so vital in their influence, that what the reader needs is to have these described with great vividness and considerable detail, leaving other periods for more cursory treatment. Now, this Mr. McCarthy has not done. The whole history of the sixteenth, seventeenth, and eighteenth centuries is narrated with about the same degree of fulness and emphasis; and, as a necessary result in so brief a work, the reader often misses what he most needs. For instance, the causes of the rebellion of 1798 are very inadequately told.

For the nineteenth century, and the present situation, it is different: this part of the work is so much more elaborated than the rest that we may consider the earlier chapters as almost an introduction to them. Fifty-two pages are given to the period since the Union; and as recent and contemporary history is always the hardest to get at, and as Mr. Walpole's excellent history ends with the Union, we need not hesitate to pronounce this the most valuable as well as freshest part of the work. Especially the years between O'Connell's agitation and Gladstone's legislation are almost a blank to most of us, so far as Irish history is concerned; and their history will be found narrated in this book with considerable detail and in an interesting manner. Even in these chapters we find some of the lack of proportion that characterizes the book as a whole; they are, however, like the rest, moderate and reasonable in tone.

BOOKS OF THE WEEK.

Der Blut-Process von Tisza-Eszlár in Ungarn. New York: Schnitzer Bros. 50 cents.
Graves, R. P. Life of Sir Wm. Rowan Hamilton. Vol. I. Philadelphia: J. B. Lippincott & Co. $6.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 6, 1883.

The Week.

THE question in what manner the promotions are to be made in the departments under the new civil-service rules is now under consideration at Washington, and it is a very important one. There is no doubt as to what the law is. It says that promotion, as well as entrance, to the service is to be obtained by competitive examination. It is obvious at a glance, however, that the circumstances under which a competition for promotion takes place are very different from those under which a competition for entrance to the service takes place. In the former case, the candidates are taken from a very small class, every member of which is well known to the head of the department or bureau; in the latter, they come from a very large class, of which he knows nothing whatever. In the latter case, therefore, he needs all the protection he can get against the numerous agencies always at work to foist unfit persons upon him. Not only this, he needs to be protected against his own selfish or corrupt interests. With regard to the officers already at work in his office, however, he stands in a totally different position. He is familiar with their character and capacity and peculiarities. One man knows more than others, but is less industrious or less accurate; another is a model of industry and accuracy, but does not know quite enough. One follows admirably a prescribed routine, but is totally unfit to meet an emergency, or deal with an anomaly. Another is remarkable for his erratic tendencies, but also for his fertility of resource and his power of sudden exertion. All these men have their special value in every office, but it is plain that they are not all equally fit to fill every vacancy that may occur in the grades above them, and that certain very important qualifications or defects in them would not be revealed by competitive examination. Something ought, therefore, to be left to the judgment and discretion of the head of the department, but not all. We say something, because he knows things about the candidates which no examination can bring out, and because there can be no proper discipline in a large organization if the chief of it has no power of reward left in his hands. It is not enough that he may dismiss a subordinate, it is also desirable that the subordinate should have something to hope from standing well in his eyes. He ought not to be allowed to punish a man whom he does not like, but who may be a very useful and meritorious officer, by withholding promotion from him altogether; but, on the other hand, no officer ought to feel that he is in no way dependent for promotion on his chief.

We would, therefore, suggest that as regards promotion competitive examination should only be allowed to do part of the work of selection, and that the remainder should be left to the superior officer, on the plan pursued by the Catholic clergy in electing a bishop. They vote for three candidates as respectively fit, fitter, and fittest, and from these the Pope makes his selection. Something of this sort would seem to be what we need in pushing men up the ladder in the civil service. The examination ought to make sure that so far as intellectual qualities go, a certain number of men are fit for the vacancy; but the head, who knows all about their other qualifications, ought to say which shall have it. As long as a large proportion of politicians are hostile to the new system, there will be great risk in making it too hard-and-fast in its operation. Nothing is more welcome to a man who does not wish to work under rules of any kind than a rule which, in matters of administration, leaves him no discretion, because he is sure to find opportunities of making it work mischief or absurdity.

The Republicans of Ohio are said to look upon their campaign as already won, although active work only began last week. They have had little to do thus far except to remain quiet and view the Democratic efforts to commit suicide. A more curious and genuine "shindy" than has been in constant operation since Judge Hoadly's nomination has never been seen in any State. It has been the evident purpose of a large section of his party to secure his defeat, not because he is not a desirable man for Governor, but because he is a reformer, and wants to make his party better. They are afraid that if he is elected Governor he will be nominated for President next year, and they do not want a reformer for President. They want a man who, as Judge Thurman said not long ago, "will take the boys in by the fire and warm their toes." If they can't have their toes warmed, what is the use in having a Democratic victory? Rather than run the risk of any reform nonsense next year, they will "kill off" Hoadly this year. Republican confidence under these circumstances is not unjustifiable.

A few weeks ago the Democrats of Hamilton County, which is the city of Cincinnati, met to nominate a county ticket. Their convention was so notoriously "packed" that a protest was at once made against its work by many eminent Democrats, and the Democratic newspaper which is Judge Hoadly's personal organ flatly refused to support the ticket. Pressure was brought to bear upon the organ, however, by means of a "dicker" between the Judge and the local boss, and a few days later the editor "turned the paper round." The article in which he achieved this familiar journalistic feat was constructed in the way which usage has decided to be the most suitable for such emergencies. The editor was unable to find words to express his abhorrence of the efforts which had been made to "debauch and destroy" the party, but, while he spurned the methods of the debaucher, he was delighted to find that the candidates were so vastly superior to the methods of their nomination that he was able to support the ticket, while he would continue to denounce the despicable autocrat who had endeavored to fasten his "envenomed fangs" upon the Democracy of Hamilton County. This heroic effort to restore harmony was, unhappily, not successful. The protesting Democrats refused to be turned around, and decided to call a new convention on September 8 and nominate a separate ticket. They propose also to endorse Judge Hoadly. The predicament to which they will thus subject the editor of the Hoadly organ is horrible to contemplate. We trust, for the sake of humanity, that the Judge will refrain from turning him around again.

Mr. Sherman S. Rogers, of Buffalo, having been requested to give his views upon the "duties which the political situation imposes upon Republicans," has responded in a letter which we commend to the thoughtful consideration of all varieties of Republican leaders. Mr. Rogers claims that the Republicans who in his section refused to support the Saratoga ticket last year, were the best and most trustworthy members of their party, and that while none of them became Democrats, it will be a great mistake to regard their revolt as a "mere summer cloud." "The action of the Independents," he adds, "marks a settled disposition, and not a temporary impulse. It would not be too much to say that it was the emphatic close of the old and the opening of a new period in the life of the party." That is the whole situation, clearly and accurately stated. What Mr. Rogers says of the character of the bolters in Western New York is true of those in other parts of the State. They were in all sections the best men in the party. They refused to vote the party ticket because they did not like the methods by which it was nominated, and because it represented a system which they detested. They would do the same thing again under similar circumstances. They cannot be won back to unquestioning party fealty by mere proclamations of harmony. Henceforth no ticket can be sure of receiving the united Republican vote in New York, unless it deserves it both in the character of its candidates and in the manner of their selection. The Independents, who only a few years ago were despised and ridiculed as "scratchers," have grown to a great multitude, numbering from 75,000 to 100,000 voters, and they are the real rulers of their party's fortunes to-day.

The long wrangle in the Pennsylvania Legislature over the reapportionment of the State has entered upon its ninth month, and agreement upon any plan is apparently as far off as ever. Neither the Republican majority in the Senate nor the Democratic majority in the House is willing to "give in." When the Legislature came together last January, the Republican Senators drew up their plan, grabbing all the districts that they could, and the Democrats of the House drew up theirs, grabbing all that they could. Each body passed its own bill and promptly refused to pass the other's. Then conferences were held, in

which no concessions of importance were made. Then each house submitted its ultimatum, and the other house in each case rejected it. Then there was endless debating, followed by fresh plans, which differed only in trifles from the first ones. Then each house made propositions which there was no likelihood that the other would accept, and then both began to appeal to the public. This went on through the five months or more of the regular session, and when the day of adjournment arrived without action having been taken, the Governor reconvened the Legislature in extra session expressly to attend to this work. More than three months have since elapsed, and the solution is as far off as ever. The cost to the State is $3,000 a day, making the expense of the extra session nearly $300,000, and of the combined regular and extra sessions nearly $800,000.

The taxpayers of Pennsylvania are naturally becoming interested in the matter, and each party is endeavoring to turn the impending wrath from its own head to that of its rival. A few disgraceful failures like this by other Legislatures might have the effect of arousing public sentiment to the wisdom of taking the burden of apportionment entirely from the Legislatures and putting it in the hands of a commission, composed of men of both political parties, and appointed by the Governor. Some such change will have to be made sooner or later, for the legislative abuse of the duty grows worse every year. The Republican members of the Pennsylvania Legislature based their refusal to refer the matter to a commission on the ground that to do so would be for the honorable legislators to "abdicate their functions." Why should they not abdicate functions which they have shown themselves incapable of performing?

The Pacific-coast jurists have been rather staggered by several of the decisions made under the Anti-Chinese Law, and have set to work to explain what they call the "nullification" of the act by the judges. The San Francisco *News-Letter* says the explanation is the "persistent opposition of New England to our State"; but the *Bulletin* qualifies this by the admission that "perhaps the motives of the persons who have been conspicuous in the nullification of this act of Congress are not in all cases the same." The "mainspring," it says, is, of course, "a desire to be in accord with a supposed prevailing sentiment"; but then some of the judges have been swayed by "the large transportation interests"; some of them think that "the heathen can be made to coerce our own laborers"—whatever that may mean; and some are influenced by a sickly feeling connected with what they call in Boston the brotherhood of man. It mentions Judges Field, Sawyer, Nelson and Lowell as among those whose decisions have been produced in this way. The legal difficulties in the way of the act in question it of course brushes aside as of no consequence. Articles of this sort usually, but very tamely, wind up with a statement that the people will shortly demand the impeachment of the wretched men; but in this case the writer closes with the maddening climax that the "Chinaman of wealth" "sleeps under his own counter, and can do business for what it costs a white man to sweep out his store." It is this image of the cheap pagan counter with the wealthy Mongolian snoring away under it, constantly present as it is in the Californian mind, that United States judges have neglected to take into account in construing the act.

The International Workman's Association has addressed a letter to the New York workingmen, in which it denounces Denis Kearney as a "traitor" to the cause of labor. They declare that Kearney is in the pay of "monopolists," and that photographs of receipts given by him for money received as bribes can be produced if desired; that the expenses of Kearney in his last trip East were defrayed by capitalists, and that he has not done an honest day's work in five years. For confirmation of these charges they refer to any of the labor unions in San Francisco. This is not the first time Kearney has been charged with treason to labor, but the letter is important as showing why he is now generally discredited among the laboring men. They have found out, or think they have found out, that he is a rascal, and the only mistake they make is in applying such a fine-sounding term as "treason" to what they have discovered. The extraordinary feature of his career was the stanch support so long given to his foul-mouthed, raving demagogism by the honest laboring population of the country. Finding him out is a good stroke for the cause.

The *Sun* publishes an interview with Mr. E. N. Hill, of Washington, in which that gentleman declares that General Garfield told him that he had offered Dorsey the Secretaryship of the Interior, and was very sorry the latter had declined. He backs this up with an affidavit, a circumstance which the *Sun* will pardon us for saying it should never have published. For some reason or other, it is now generally recognized that a political charge made by one of Dorsey's friends is better without an affidavit. When a man of Mr. Hill's eminence makes a charge against anybody, that is enough. For him to call at once for a Bible and notary public is not merely superfluous. The reader pauses and hesitatingly asks himself, Why should E. N. Hill take an affidavit? Why should he impeach his own habitual and well-known veracity by suggesting that his word, unsupported by an oath, would not be at once believed? This is the great objection to affidavits, and the reason why in political campaigns they fail to settle so many controversies.

The movement of the crops has been tardy this year, but is now increasing rapidly. The total receipts of grain at the eight principal primary markets in the West during the last week were more than double as much as in the first week of August. The export movement of breadstuffs has also increased, and is now nearly up to the large volume of the corresponding time last year. Notwithstanding some damage to the cotton crop and the depressed condition of the foreign market for cotton, the general commercial outlook is more favorable than at any time for nearly a year. There is unquestionably much distrust yet in regard to the general soundness of mercantile credit. The facts disclosed in connection with the Shaw failure in Boston have shown that in the last few years there has been a great change in the general methods of making mercantile paper, of which the great bulk is now single-name paper instead of double-name, and that in many instances the greater facility for borrowing afforded by this change has induced merchants to borrow for speculative purposes when they did not require the money in their regular business. This is now almost the only unfavorable feature in the whole commercial and financial situation. The crops have been abundant, there are fair markets for all the exportable surplus. Foreign capital is beginning to buy American securities, and the probabilities are in favor of imports of specie before the end of the year. The one thing necessary to a complete restoration of confidence and prosperity is the assurance that the failures of the last month have eliminated the element of unsoundness above referred to.

The recent auction sales of domestic dry goods have been made at losing prices to the manufacturers. It would probably be an underestimate to put the average loss at 10 per cent. The stocks had been carried in the producers' hands as long as was possible, and the sales were made in most cases because the banks were glutted with paper drawn against this class of property and could not take any more. The upshot of the matter is that a portion of the manufacturers' capital disappeared when the goods were disposed of, and that further production must involve a similar sacrifice unless prices improve, or the producer can lessen the cost of his fabrics in a corresponding ratio. Reduction of cost means either lower wages or cheaper materials, or both. There can be no reduction of profits, because profits are below zero already. Many manufacturers will continue work for a time, even at a loss, rather than allow their operatives to leave them and their machinery to deteriorate through disuse, but there are obvious limits to this kind of production. There must come a time when the spindle will cease to turn under such conditions. The manufacturer no more than the operative can make something out of nothing. The cost of production cannot long exceed the proceeds of sales, and we judge that the time is close at hand when the manufacturers must either shorten their hours or reduce wages, or find cheaper raw materials. Fortunately the latter alternative is within their reach. Whether they will be wise enough to avail themselves of it is another question. The existing tariff imposes duties on the raw materials of manufacturing industry which it would be quite within bounds to estimate at an average of 30 per cent. These are duties on wool, ores, metals, dye-stuffs, chemicals, machinery, and a long list of textile fabrics which are not produced in this country to any considerable extent, but which are nevertheless part and parcel of the protective system.

These duties weigh upon the domestic manufacturer like lead. They enter into his cost of production in the same way as motive power, wages, rent, interest, or any other expenditure he has to make. In point of fact they are consuming the profit which he might otherwise make, even in the present state of the market, for his finished product. We commend the fact to his serious consideration.

As New York is one of the great restaurant cities of the world, all disputes involving the respective rights of waiters, "guests," and "proprietors" are of interest to three very large and important classes of the community. Mr. S. H. Preston, of this city, is going to bring a suit for $5,000 against Mr. Shoemaker, the proprietor of a Broadway restaurant, which will involve the responsibility of proprietors for the behavior of waiters. The facts out of which the dispute arose, according to his evidently biassed account, are these: Mr. Preston, who is described as a quiet, inoffensive man, went to the restaurant with a lady, and ordered one of Mr. Shoemaker's most noted waiters named "Billy" to get him a dinner. Billy is a powerful man, and is said to have been a "bouncer" at one time—a position the duties of which, it must be confessed, are clearly different from, and, perhaps, hardly a good preparation for, those of a waiter. Mr. Preston found it impossible to get the dishes which he ordered, and remonstrated, whereupon Billy, threatening him with instant death, sprang upon him and knocked him out of his chair with a severe blow in the face. The unfortunate man was rescued, and now declares it to be his intention to make it a "test case." Billy has disappeared, so we are obliged to be content for the present with the guest's side of the story. Those who like to take a fair view of such matters will, however, be easily able to perceive that the proprietor's view of the matter must be very different. We all know how irritating it must be to a waiter, particularly if he happens to be an ex-bouncer, to be found fault with for such little things as bringing fried potatoes when boiled have been ordered, or mutton when beef was asked for—in themselves mere trifles, and often difficult to remember. The general docility and patience of guests are what mainly makes life supportable to waiters, and a fault-finder will sometimes get into trouble among them. This is the view of such matters generally taken by proprietors. Billy's threat that he would murder Mr. Preston is, of course, a private matter between the two.

The cotton-planters of the South are known to have much trouble with their "labor." After a certain amount of work has been done by the negroes, and advances have been made, the planters are suddenly left in the lurch by the disappearance of their hands, who have gone to camp-meeting or perchance to a new employer. An action for breach of contract is out of the question, as such promise-breakers are generally either utterly insolvent, or possessed of only enough property to come within the exemption laws, so kind in their intentions, and so liberally construed by the judiciary. The remedy afforded by courts of equity—specific performance—is also plainly impracticable, and the result is loss to men least able to suffer loss, and very general loss, for such "contract-jumping," as the Macon *Telegraph* terms it, is very common. The Georgia Legislature has been moved by the importunity of farmers to devise a remedy for this great evil. A bill has lately passed the Senate which declares it "a misdemeanor for any person engaged to labor for another to break his contract after he has obtained credit on account of said employment, and on promise that he would continue in said employment." It is difficult to see why the violation of a contract by one who has promised to pay in work for advances made should be called a misdemeanor, punishable with imprisonment, when a similar violation by one who has expressly or impliedly promised to pay in money for goods bought, or labor done, is not.

London is making anew for itself the wooden-pavement experiment which was tried and found wanting in our streets ten or a dozen years ago. It is curious to notice the unsuspecting innocence with which the London journals discuss the first signs of failure. They little know what is in store for them. They say that while the pavement which has been so extensively laid down in the city is a great comfort in diminishing the noise of travel, it leaves much to be desired as regards cleanliness. The *St. James's Gazette* says: "Small boys are employed in some districts, who endeavor to keep the roads clean with the aid of hand-brushes and scoops, but they are of no avail to remove the coagulated dirt which sticks to the pavement and forms a coating of a most offensive nature." The same journal concludes that a "thorough scrubbing at frequent intervals" is the only adequate remedy, but admits that "how this is to be done is a problem yet to be solved." The other problems of depressions and mud-holes will arise soon, and ultimately the discovery will be made that the only remedy for a wooden pavement is to tear it up and put something else in its place. This remedy was adopted here several years ago, and is at last being adopted in Chicago.

There is an unusual stir just now among the crowned heads of Europe. The Emperors of Germany and Austria-Hungary have met at Ischl. The Prince of Montenegro has visited the Sultan at Constantinople. The King of Rumania, a Hohenzollern by descent, has been to see the imperial chief of his house in Berlin. The King of Servia has been the guest of Francis Joseph in Vienna. Czar Alexander III., with his Danish consort, is staying with his royal father-in-law in Copenhagen. Alfonso of Spain is about to exchange, for a while, the banks of the Manzanares for those of the Spree. Speculation is rife concerning most of these princely journeys, and, as usual, the name of Bismarck is whispered in explanation by political wiseacres. The net astutely woven by "the arbiter of the destinies of Europe" against Russia and France is being extended. Carol of Hohenzollern, Milan Obrenovitch, and the son of Isabella will join the triple alliance of Germany, Austria-Hungary, and Italy; Nikita, in the interest of Russia, courts the favor of the Porte, and the Czar bids for a Scandinavian alliance. There may possibly be a little truth in these guesses. If Alfonso does go to Berlin, he undoubtedly means to seek protection against dangers threatening him from the side of republican France. Whether Bismarck is disposed to offer him any is another question, especially as such a proffer is more likely to precipitate upon the Spanish Bourbon the ruin portended by the late military conspiracy—the fear of which leaves him no rest in his capital—than to avert it. Alexander's journey is easily explained by filial affection and the comparative security which the peaceful royal abodes of Denmark offer to the weary dweller at Nihilist-haunted Gatchina and Peterhof. The King of Rumania has been invited to Berlin to become the godfather of the new-born great-grandson of Emperor William. But it is worthy of notice that he arrived at the very hour when this oldest of monarchs celebrated with ostentatious *éclat* the birthday of his Austrian ally. And there can hardly be any doubt that Milan is very anxious to secure the greatest amount of neighborly help on the part of Austria-Hungary, menaced as he is by the constant plottings of the exiled House of Karageorge, the representative scion of which, Prince Peter Karageorgevitch, has just been united in wedlock with the daughter of the Prince of Montenegro, a less open but not less dangerous foe to the present Servian dynasty.

There has never been the least reason for thinking that the Chinese Government was not in earnest in maintaining its suzerainty over Tonquin and Anam. The "treaty" which the successes of the French at Hué enabled them to extort, week before last, has hardly been announced before we hear of the Chinese advance in force upon Haidzuong, and the beginning of a struggle in which the advantages in point of strength or military prowess are doubtfully on the side of the French. Fighting at arm's length with China is in no respect what it was forty years ago for any European Power. That vast empire now lacks neither the most destructive weapons of modern warfare, nor arsenals, nor ironclads, nor Western tactics; it has lately called to its assistance the telegraph, and the present operations may teach it the utility of the railway as a means of national defence. Ever since the Russo-Chinese collision in Kulja in 1880, speculation as to the result of a genuine set-to between the most populous and tenacious nation on earth and any European force which it could get at has been anything but frivolous. There can be no doubt that both Russia and England are highly interested spectators of the drama just opening in the delta of the Red River. Much anxiety must also prevail among the European inhabitants of the treaty ports of China, for the populace are not very discriminating as to "foreign devils," and the approach of a hostile French fleet might revive scenes of savage violence which are still fresh in the memory of the present generation.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, August 29, to TUESDAY, September 4, 1883, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR and his party started East by rail last Saturday morning. They arrived at the Mammoth Hot Springs on Friday, and camped near the hotel over night, having travelled, during the trip, about 300 miles on horseback. They reached Chicago on Tuesday.

The several parties of foreign and American celebrities who had been invited by President Villard to attend the opening of the Northern Pacific Railroad arrived at Minneapolis on Monday, where they were given a very hearty reception. An elegant luncheon was served them by the city, after which there were speeches made in reply to toasts to Mr. Villard, Jay Cooke, and others. The city of St. Paul entertained the excursionists at Minnetonka Beach in the afternoon. President Arthur was present and made a short speech, in which he said: "Coming to you from that wonderland of America I have travelled a thousand miles by the Northern Pacific Railroad. Nothing I have read, nothing I have ever heard, has equalled what I have seen, which convinces me of the importance of this great enterprise, and that it has not been overestimated by its most sanguine friends. All honor then to the zeal and energy which have given to that enterprise such tremendous success." Mr. Villard then thanked the people for their good wishes and kindness. On Tuesday the excursionists were at Fargo, Dakota, and later in the day visited the Dalrymple farms.

The Directors of the Western Union Telegraph Company have made a concession to their employees by issuing the following order: "Commencing to-day (September 1) seven and a half hours' actual service in this office during week nights will constitute a day's work, or, in other words, the hours of the night force will be from 5:30 P. M. till 1:30 A. M., allowing thirty minutes for lunch. Sunday service will be paid for the same as other over-time services, at the rate of one-seventh of a day's pay for each hour. All payments for over-time, including Sunday service, or for a fractional part of a month, will be based upon the number of week days in the month."

Dr. Norvin Green, President of the Western Union Telegraph Company, gave some very interesting testimony before the Senate Sub-Committee on Labor and Education, in this city, on Thursday and Friday. He explained to some extent the financial methods of the Western Union. Mr. John Roach, the shipbuilder, was before the Committee on Tuesday.

Some German capitalists have prepared a claim that the United States is responsible for the payment of certain bonds repudiated by Georgia in 1869 in aid of the Brunswick Railroad, because this breach of faith occurred during the administration of a provisional governor appointed by the United States.

The first appointment in the Post-office Department at Washington under the new civil-service rules was made on Wednesday, when Ovington E. Weller, of Granite, Md., was selected to fill a one-thousand-dollar vacancy.

The United States Commissioner of Patents has made the important decision that a word merely descriptive of an article of trade, or its qualities, ingredients, or characteristics, cannot become a lawful trade-mark by virtue of a change in its orthography to that of a foreign language in which it possesses the same meaning.

It is currently reported that John C. New, Assistant Secretary of the Treasury, will soon resign his office, on account of the pressure of private business.

A naval court-martial has been trying a number of cadets at Annapolis, Md., during the week for hazing fourth-classmen. On Tuesday two of the accused were acquitted.

A secret conference of leading Southern politicians of the Mahone school was held in Washington on Wednesday and Thursday. The following persons are said to have been present: Mahone and Brady, of Virginia; Chalmers and Jeffards, of Mississippi; and Longstreet, of Georgia. The prime object of the meeting is said to have been to discuss a plan of activity that will assure Democratic defeat in 1884, and exalt the leadership and methods of Mahone.

The Pennsylvania Greenback Convention on Thursday nominated T. P. Rynder for Auditor-General and A. T. Marsh for State Treasurer. Among the planks of the platform is the following: "As the national Government can alone create money, the national Government should alone issue it and control its volume, which should be of sufficient amount, issued in payment of Government debt or other value received, to enable our people to transact the business of the country on a cash basis."

There is a report in political circles of that State that well-known politicians are endeavoring to effect a complete fusion of the opposition parties in Iowa, and the plan, as announced, is to secure the withdrawal of Kinne, the Democratic candidate for Governor, in favor of General Weaver, with the understanding that Kinne is to be supported by the combined opposition in the Legislature for United States Senator.

The New Jersey Republican State Convention is called to meet at Trenton on September 18. Ex-Gov. Joel Parker has written a letter to Mayor J. C. Yard, of Freehold, positively declining to be a candidate for the Gubernatorial nomination at the New Jersey Democratic Convention.

Governor Butler, of Massachusetts, has decided to be a candidate for renomination. Massachusetts men say that this decision is probably due to the belief on his part that Henry L. Pierce will not consent to be the Republican candidate for Governor.

The Republican State Committee of Massachusetts has issued an address to the people, which says: "No one can overlook the significance of the result in Massachusetts this autumn upon the next Presidential election. At the same time, it would be worse than idle to disguise the fact that the coming election is essentially a State campaign. To the people of Massachusetts, the issues are almost unprecedented in gravity, and justly outweigh all other considerations."

Representative Blackburn, of Kentucky, announces that he is not a candidate for the Speakership, but is a candidate for United States Senator.

The wheat crop in Kansas is threshing out much heavier than was expected, and the State Board of Agriculture now asserts that the crop will aggregate 35,000,000 bushels. The corn crop in Kansas, it is estimated, will reach fully 200,000,000 bushels, and will be the largest ever produced in the State.

The crops in Virginia have been seriously damaged by a drought extending over almost two months.

Reports from more than one hundred tobacco-growing towns in the Connecticut and Housatonic Valleys indicate that the crop for 1883 will be a full average in yield and excellent in quality.

The Massachusetts Central Railroad was sold on Saturday, at Hudson, Mass., under mortgagee sale, to S. N. Aldrich for $500,000. Mr. Aldrich represents a committee of bondholders, and his purchase is exclusive of the rolling-stock.

The tide was unusually high on the New Jersey coast on Wednesday, and the surf was very strong. At Atlantic City a vast amount of destruction was caused, the losses footing up about $100,000. Damage was done at Long Branch and other resorts.

During the month of August the public debt of the United States was reduced $6,671,851 71.

The Foreign Exhibition at Boston was opened on Monday, in the presence of about 1,000 spectators. Many prominent people were present.

The Convention of Deaf Mutes closed its sessions in this city on Thursday. The next Convention will be held in Washington in 1888, when the centennial birthday of the Rev. Thomas Gallaudet, the "Father of the Deaf Mutes," will be celebrated.

A convention of Freethinkers has been in session in Rochester during the week.

Much excitement has been caused in Missouri by the decision of a local judge in St. Louis that the Downing High License Liquor Law is inoperative on account of an old law of 1857.

The semi-centennial of the first white settlement of Dubuque, Ia., was celebrated on Monday.

On Sunday at high mass the Rev. Father Hennessy announced in the Catholic Church in Atlanta, Ga., that on the morrow male children of Catholic parents should attend a school taught by the Sisters, and that those who continued to send their children to the public schools should be deprived of the sacraments. In this school, he said, they would be saved from the demoralizing influences of the public schools.

FOREIGN.

The Comte de Paris has notified the courts of Europe of the death of the Comte de Chambord. The circular of notification is signed "Philippe, Comte de Paris." It is asserted that before his death the Comte de Chambord directed that his body should always remain at Göritz, even if the monarchy should be restored. He said: "They would not have me living, and will not want me dead." On Saturday 3,000 Frenchmen were already at Göritz to attend the funeral. The Comtesse de Chambord, having expressed the wish that the position of chief mourner at the funeral of her husband should be held by the latter's nearest relative, the Comte de Paris decided to return to Paris with the other Orleanist Princes on Saturday night. The Comtesse de Chambord wished the funeral of the Count to have a private character, whereas if the Comte de Paris took the first place it would have the character of a public monarchical demonstration. The Paris newspapers believe that this act has caused a rupture between the Orleanists and Legitimists. The body of the Comte de Chambord was conveyed to Göritz on Sunday. The city was draped in mourning. On Monday the funeral ceremonies took place at Göritz. Five thousand French Royalists took part in them. Several groups of the Royalists held meetings on that day, and declared for the Comte de Paris as the successor of the dead Bourbon.

The French Minister of Marine on Wednesday received a despatch announcing that a treaty of peace between France and Anam had been signed at Hué on August 25. The treaty provides for the complete recognition of a French protectorate over Anam and Tonquin, the definitive annexation of Dinthuan to Cochin China, the permanent military occupation by the French of the forts on the Thuan and Vingchua line, the immediate recall of the Anamite troops from Tonquin, the placing of the garrison there on a peace footing, and the return of the mandarins to their posts. France undertakes to expel the "Black Flags" from Tonquin, and thus insure safety to trade. The Anamite finances and customs are to be absolutely controlled by the French. The treaty allows France to station Residents in all the chief towns of Tonquin, who are to

be accompanied by the necessary number of troops. France may also construct forts on the banks of the Red River. The French Resident at Hué is to have the privilege, which has formerly been refused, of private audiences with the sovereign. The opinion of the Chinese Legation in Berlin is that the treaty between France and Anam is invalid, as China has not recognized the new King of Anam. The French have occupied the city of Hué.

The French General Bouet in Anam has demanded of the War Department an additional reinforcement of 5,000 men. The French Admiral has issued a notice declaring all the ports of Anam, including Saigon, in a state of blockade.

It was reported from Vienna on Monday that the Chinese Government intends to issue a formal protest to the great Powers, declaring that the treaty of peace between France and Anam signed at Hué is void, as the King of Anam was forced by the French to sign it.

On Monday afternoon and Tuesday morning alarming rumors reached Paris and London from Tonquin. It was reported that China had gone to war against the French. Open hostilities were begun suddenly. Fifteen thousand Chinese troops had been despatched from the army of 30,000 which was massed on the Tonquin frontier right after the French were repulsed at Hanoi. This detachment, after crossing the frontier, marched straight upon Haidzuong, one of the first places taken by the French after they succeeded in mastering Hanoi. At the approach of the Chinese troops toward Haidzuong the Anamite forces, under French supervision, marched out in force to oppose their progress. The Anamites were repulsed by the Chinese. The forward movement of the Chinese troops took the French by surprise. It is believed that the Chinese have already taken Haidzuong, and will next march against Hanoi. The advance army is being well supported by the army massed at the frontier, which is being constantly reinforced. A Hong Kong despatch on Tuesday reported that 4,000 Chinese troops, which were stationed at Pakoi, had been ordered to the frontier. The Anamites still threaten Namdinh. A French Cabinet meeting was held on Tuesday, at which Prime Minister Ferry presided. The Cabinet decided to send large reinforcements to Tonquin, consisting of troops from Algeria and the foreign legion.

Ivan Turgeneff, the Russian novelist, died at Bougival, France, on Monday, after a long illness. He was born on November 9, 1818, in the Government of Orel, in the interior of Russia, of noble parentage. Early in life he showed a leaning toward Liberalism. His literary career was begun with a volume of poems. He soon began to write sketches of peasant life, remarkable for their realism. Some of these were collected in a book called 'The Journal of a Sportsman.' The Czar Alexander II. admitted that it was the reading of these sketches which first opened his eyes to the demoralizing effects of serfdom, thereby hastening the act of emancipation when he succeeded to the throne of the Emperor Nicholas. Turgeneff was banished for his plain speaking. He spent most of his later years in Paris and other European cities outside of his native land. He wrote more than a score of novels, many of which have been translated into French and English. His philosophy of life was pessimistic, and his novels all end tragically.

The German Reichstag was opened on Wednesday. The message of Emperor William related solely to the treaty of commerce with Spain. It declared that the Reichstag was called solely to ratify the treaty, and to secure beyond doubt the payment of the indemnity granted to the Government by the Bundesrath for carrying the provisions of the treaty into immediate effect. The treaty passed its third reading on Saturday, and the indemnity was also granted. The session was then closed.

The Berlin *North German Gazette* (Prince Bismarck's organ), whose recent article against France created a sensation throughout Europe, says it believes that the thanks of all friends of peace, even in France, are due to the *Gazette* for its timely warning of the consequences which would result from systematic agitation in France with the object of exciting hate against Germany.

Emperor William of Germany reviewed the Guards in Berlin on Wednesday instead of on the anniversary of the battle of Sedan, as intended. It is believed that the change was made out of deference to French sentiment.

Prince Bismarck and Count Kálnoky, Austrian Foreign Minister, met at Salzburg, Austria, on Friday. It is understood that the prolongation of the triple alliance and the formation of a quadruple alliance were discussed. An arrangement was also made for a common demonstration on the frontiers of Russia, and the admission of Rumania and Servia into the triple alliance.

The outlook in Croatia is gloomy. A national rising is feared if the Hungarian Government persists in renewing the Magyar escutcheon and inscriptions at public offices.

A common Ministerial Council in Vienna on Monday approved the resolutions of the Hungarian Cabinet Ministers to place the civil and military power in Croatia under the control of Baron von Ramberg, the military commander at Agram, who is to remain in power until the question of the Hungarian escutcheons is settled.

The Archduchess Stephanie, wife of the Archduke Rudolph, Prince Imperial of Austria-Hungary, was delivered of a daughter on Sunday.

Christopher Bernard Levin Schücking, the German novelist, formerly connected with the *Augsburg Gazette* and *Cologne Gazette*, died on Sunday, aged sixty-nine years.

The Czar and Czarina of Russia arrived in Copenhagen on Thursday, and were received with great honors by the Kings of Greece and Denmark.

The Russian representative at Sophia has told a Bulgarian deputation that Russian officials now in Bulgaria would, by the Czar's wish, remain there two years longer, and that opposition to their staying would be regarded as rebellion against Russia.

After several interviews with the King Prime Minister Sagasta, of Spain, has decided not to insist upon the resignation of the Cabinet. He considered that a change of Ministry now would interfere with the royal tour in Asturia and Galicia on the occasion of the opening of the Northwest Railway on September 1. At a meeting of the Cabinet on Thursday the King's proposed visit to Germany was approved. The King started for Corunna on Friday. The constitutional guarantees were restored on Saturday.

Ruiz Zorilla, the Spanish revolutionist, has quitted France at the invitation of the Government of that country.

A meeting of the Irish National League was held in Dublin on Wednesday. Mr. Parnell, in a speech, referred to the success of the efforts of the Irish members of Parliament to promote the Laborers, Tramways, and Navigation Acts. He said he believed the day was near when the Irish would gain the full programme of measures for which the League had been formed. He said that the bulk of the English members of the House of Commons had conceded that home rule was necessary for Ireland. Mr. Parnell also said that he could report most encouragingly of the progress of the National League in America.

It was reported in London on Thursday that alarming telegrams had been received from America of the revival of the Irish conspiracy.

Six Irishmen suspected of having been connected with the dynamite attempts in Glasgow on January 20, when the largest gasometer in the city was blown up and other property destroyed, were arrested in Glasgow on Friday night. Three more Irishmen have been arrested on the same charge.

James McDermott, who was arrested on suspicion of having been connected with the Irish dynamite conspiracy, was brought before the court again in Liverpool on Tuesday, and was further remanded to jail at the request of counsel for the prosecution, who said that a pocket-book found among the prisoner's effects contained very important entries, but their nature was not indicated.

At a meeting of Irishmen held in London on Friday night, money was subscribed to pay an eminent solicitor to defend O'Donnell, the slayer of James Carey.

Mr. Alexander Mackenzie, in an address before the Chamber of Commerce of Greenock, Scotland, on Wednesday evening, combated the proposals of Sir Alexander T. Galt for a federated union, on the ground that Canada would never submit to being ruled at London. He spoke in condemnation of a protective policy, and predicted that Canada would soon return to free trade. He scouted the idea of a separation of Canada from England. On Thursday he sailed for Quebec.

The Vicar of Stratford-upon-Avon, England, has signified his willingness to allow the remains of Shakspere to be exhumed. The object in disturbing them is to compare the skull of the poet with the bust and portraits of him. The bishop and town-council are strenuously opposed to this proceeding.

The début of Mary Anderson in "Ingomar" at the Lyceum Theatre, London, on Saturday night, was a genuine success.

Marwood, the English hangman, died on Tuesday.

Mr. Shaw, the English missionary to Madagascar, who was imprisoned by the French, complains bitterly of his treatment on board the French flagship. He has arrived at Durban.

An official report shows that there have been 27,318 deaths from cholera in Egypt since the outbreak of the epidemic. There were only three deaths at Alexandria on Monday, and the epidemic is considered as nearly extinct.

Details of the disaster caused by volcanic eruptions in Java and the neighboring islands show that the loss of life and property was enormous. One estimate places the loss of life at 100,000.

Reports have been received from Newfoundland of a violent storm on the Great Banks on August 26, by which one hundred fishing dories and eighty lives were lost. Later despatches assert that the loss of life has been exaggerated.

A despatch from Vardöe, Norway, on Friday, announced that the steamer *Obi* has arrived there, having on board the members of the Dutch expedition to the Arctic which sailed on the steamer *Varna*. The *Varna* foundered on July 14, in latitude 71½° north, longitude 63° east. The members of the expedition were rescued near the island of Waigatz. The *Obi* reports that the Arctic steamer *Dymphna* was icebound near Waigatz throughout the winter. All on board of her were well, and the captain was confident of reaching open water. The *Varna* was a Norwegian steamer chartered to take the Dutch Meteorological Expedition to their destination at Dickson Haven, in the summer of 1882. The *Dymphna* sailed from Copenhagen on July 18, 1882, with the expedition of Lieutenant A. Hovgaard, of the Danish navy, on board.

The Government of Morocco has apologized to Italy for the recent trouble at Anjer, and the difficulty has terminated.

Zululand is in a state of anarchy, and Cetewayo has asked for protection.

MAHONE'S ASPIRATIONS.

It is evident that Senator Mahone is planning to play an important part in the Presidential campaign of next year. He is likely to be the chief representative of the decaying boss system, and to use in his manœuvres all the resources which belong to bossism. He is laying his plans now, and the conference in Washington is understood to have been in their interest. Two schemes are attributed to him by those who have studied his movements most closely. The first is to organize in Virginia and other Southern States a plan for securing control of the delegations to the National Republican Convention. This is to be accomplished by having all the Federal patronage in the South distributed among men who are in sympathy with Mahone and the Administration. If this plan succeeds, Mahone will present himself at the National Convention with his captured delegations, and demand admission for them as Republicans. If he is denied admission, he will take his delegates away, and organize independent electoral tickets in Virginia and a few other States, and try to have them elected without being pledged in favor of any Presidential candidates. If he can elect such a ticket, even in Virginia alone, he will take the field after election as a "striker," and will offer his electoral votes to whichever candidate will give the highest "terms."

These are said to be Mahone's plans. They are bold to recklessness, and the accomplishment of either is very improbable. Still there are elements in the political situation which make it possible for Mahone to give the regular party leaders some trouble. He has practically annihilated the Republican party in Virginia by first demoralizing it with his repudiation sentiments and then, with the connivance of the Administration, depriving it of all Federal patronage. He has built up for himself a party which is composed of former Republicans and Democrats, whose political creed is simply to follow wherever Mahone leads. He will take a delegation of these men to the Republican Convention, and with them as many others of the same kind as can be got together in other Southern States, but they will all have to appear there as contesting delegations. Mr. Blaine's friends are organizing a "straight-out" Republican movement from the remnants of the party in Virginia, and they will be likely to do the same thing in every other State which Mahone captures. These anti-Mahone delegations, if they are sent, will apply for admission as regular Republicans, and the Convention will have to decide between them and the Mahone delegations. This would raise an interesting question in the Convention, but unless Northern Republican sentiment changes radically during the next eight or nine months, the decision would be against Mahone. He has never been popular with the Republicans of the North and West, and the delegates from those sections could hardly be so short-sighted as to think of carrying the country with a ticket handicapped with repudiation.

Shut out of the Convention, Mahone would have nothing to do but resort to his second plan, unless the Democrats opened negotiations with him for his delegation—a not improbable contingency. His strongest position, however, would be as the holder of Virginia's twelve electoral votes unpledged to any candidate. The next Presidential election is likely to be very close, and if, as was the case in 1876, the vote of a single State were to decide it, Mahone, with the vote of Virginia in his pocket, would be a tremendously important personage. That would be the position which all his hopes are centred upon, for he would then be the boss of the whole United States. But the great difficulty for him would be the carrying of Virginia for such an electoral ticket. In 1880, when he was a Hancock man, Mahone's Readjuster party polled 31,000 votes, against 96,000 by the Democrats. The Republican vote for Garfield was 83,000. Since that time Mahone has become a Republican, and if he could hold all his Readjusters, and secure all the Republicans, he could obviously carry the State; but this is impossible. His alliance with the Administration has given him more patronage, but it has not added materially to his popular strength, and his party is known to be much less strong now than it was when he carried the State in 1881. Indeed, the struggle for control of the Legislature this year is so earnest that the Republicans and Bourbons are in some instances combining against Mahone, and there are even chances that his party will be defeated. An attempt, therefore, to induce the State to put its electoral vote up at auction for the benefit of Mahone, would not be likely to succeed.

We see no reason, consequently, for the anxiety which is displayed, in some Republican quarters, over Mahone's movements. There is little likelihood that he and the other political adventurers who are associated with him will be able to organize in any other State than Virginia an anti-Bourbon party which will be strong enough to take the electoral vote away from the Democratic candidates, and even in Virginia the prospect for doing it is doubtful. Mahone has a temporary importance as the distributor-in-chief of Southern offices. If the President were to deprive him of that position, he would pass instantly into obscurity.

STOCKS AND THE STOCK EXCHANGE.

The peculiarity and distinguishing feature of the recent heavy decline in Stock-Exchange securities is that it was neither ushered in nor followed by a commercial crisis. The shrinkage in listed securities since the beginning of July, 1881, is estimated by good judges at nearly if not quite $1,000,000,000. This tremendous decline has taken place for the most part gradually. Only within the past month has there been any sudden and great decline in prices on the Exchange, and this, as well as the former gradual decline, has taken place without any sensible disturbance in the commercial world, and with very few failures, and no great ones, on the Exchange itself. Manufacturing business has been seriously depressed, but the number of failures has been small. The regular mercantile trade of the country and the agricultural interest are fairly prosperous, although profits are not large. The situation betokens a relatively low scale of indebtedness, and therefore little room for panic and crisis. The condition of the principal crops of the year is now pretty well known—that of the corn crop alone being involved in some doubt, with the probabilities in favor of a large yield.

The most common and indeed the invariable sign which presages a commercial crisis, is a high rate of interest for money. The existing condition of the money market is that of extraordinary ease. The shrinkage of stock values has undoubtedly had much to do with this, as it takes less and less money to carry securities as the market recedes. But apart from this circumstance, which applies chiefly to New York, and only to the banks and financial companies which do a Stock-Exchange business, the fact is apparent on every side that money is abundant, and even superabundant, for every legitimate purpose. But for the return of large blocks of our securities held abroad we should now be importing specie to add to the great stock which we have on hand. It is a marked feature of the present time, as compared with 1873, that our money is now at par with gold instead of being a slippery commodity, varying in its rate of discount from day to day and from hour to hour.

The singularity of the present situation—a great depression in securities, a very low rate of interest, a good harvest in prospect, and none of the usual signs of a crisis in the commercial horizon, all going to make up a sort of "dry panic" on the Stock Exchange—is attributed by those persons most familiar with Wall Street to the absence of "the public" from the community of buyers and sellers, and to the fact that all the business is monopolized by room-traders who have the power to mark prices up to-day and down to-morrow, or up and down several times each day. This is an unsatisfactory condition of things, to be sure, but if it be the real condition of business it must have a cause, for although the outside investing public are rather short of money, they are not so destitute of means or so wanting in the spirit of adventure as their present temper would seem to indicate. The extremely low rate of interest is itself proof that money is not wanting, but is lying unused, and that the only thing lacking is confidence.

Now, confidence is proverbially a plant of slow growth. Confidence in the general run of Stock-Exchange securities has been tremendously impaired, as is shown by the shrinkage of the past two years. If it be desirable that "the public" should come back to the Stock Exchange—as they must sooner or later if unemployed capital continues to accumulate—means must be taken to restore confidence among them. One measure of the first importance is to insure the prompt and regular publication of the earnings of the properties whose securities are listed on the Exchange, under penalty of being stricken from the list for failure to publish such earnings, or for any false statement of the same. The members of the Exchange have this matter within their own control. The value of their seats in the body itself depends upon the amount of business done, not with each other, but for the public. They cannot fail to see that the darkness which shrouds the receipts

and disbursements of companies which make no regular and stated returns is now the most terrifying factor of the situation to the outside public. This is no new question. Nothing, perhaps, has more frequently agitated the Exchange than the problem how to compel publicity on the part of all the corporations whose securities are traded in, and upon which banks and other corporations lend money. In times of general prosperity, when business is active and all goes swimmingly, the corporations in question are able to take a high stand toward the Exchange and to say, virtually, "If you don't want our securities on your list a place will be found to buy and sell them elsewhere"; in other words, a rival Stock Exchange will be established. In times like the present, however, no such stand can be taken. There is not sufficient business of the legitimate type to support one Exchange, and this is the time when the public would be least likely to extend their patronage to an Exchange based upon the non-publication of earnings. Now, if ever, is the ripe occasion and opportunity for the Exchange to insist upon publicity, and solemnly to expel from their floor every security whose returns are not spread before the members in black and white at stated intervals—regard being had, of course, to the character of the business transacted by them respectively.

A NATIONAL FOREST PRESERVE.

THE importance of forest preservation as a national measure has been widely discussed in the public press. The subject has been heretofore treated, however, in a general way, and practical measures, by which a solution of the question might perhaps be reached, have thus far hardly been hinted at. It is believed that forest preservation in the United States is a necessity, but in what manner the desired results can best be accomplished has not yet been made clear. The proper relation of the Government to the forests of the country is, nevertheless, less complex than might be supposed. The Government of the United States has clearly no more concern in holding or managing forest property than it has in working its unoccupied wheat-fields, except so far as forests, from their peculiar location, are essential to the preservation of the important rivers of the country. If this is clearly understood and acknowledged, the whole question will be greatly simplified. The forests of Michigan or Louisiana may be exterminated, as have been those of New England, without seriously affecting the nation as a nation. Such forests will grow again if profit can be found in growing them; but if the forests which guard the flow of great rivers such as head among the Adirondacks or the Sierras of California, the Alleghanies, or the Rocky Mountains, are destroyed, there is something more than a local destruction of property. The steady flow of the rivers is endangered, and wide-spread disturbance, threatening the lives and property of persons living perhaps thousands of miles from the forests upon which their safety depends, is the result. It is clearly the duty of the Government, then, to preserve in every way possible the great rivers of the country; and forest preservation is thus, under certain conditions, a vital question. The prosperity of the nation even depends upon it. So far, then, as the forests affect the rivers, they should be made the subject of national investigation and preservation; but for no other consideration should the Government, either General or State, become a forester. Individuals can grow timber, and take care of it when grown, better than the Government, and the less the Government mixes itself up with business of this nature, the better.

These thoughts are suggested by an examination of the preliminary notes of a party of the Northern Transcontinental Survey, engaged during the present summer in exploring the main Rocky Mountain range, near the northern boundary of the United States, with special reference to studying the capacity of the streams for irrigating the rich valleys of Northern Montana. They followed the western shore of Flathead Lake, up the eastern fork of the river of that name, and then, after innumerable difficulties and the loss of many animals, crossed the mountains by the old Marias Pass, one of the highest and most difficult gateways in the whole continental divide—a journey only once previously accomplished, so far as is known, by white men, although formerly sometimes made by predatory or hunting bands of Flathead or Blackfeet Indians. The explorers were well repaid. They found four distinct ranges of mountains, separated by high lateral valleys—not one range, as is shown upon existing maps; they found glaciers, of recent origin and of no great extent, to be sure, but important witnesses of an increasing precipitation of moisture in this northern region; they found a noble forest, covering valleys and mountain sides, in which trees of the Pacific coast mingle with those of the dry interior region of the continent and with others of our Northern Atlantic woods; they found a flora remarkable in the great number of California forms which it contains, and scenery so appallingly grand that the continent cannot show its equal. The structure of these northern mountains, formed of limestone or of quartzites and calcareous slates, which break away at sharp angles, forming stupendous perpendicular precipices, and clear-cut pyramidal peaks, produces the peculiar features of the scenery of the region, and gives it a rugged boldness of outline unknown among the rounded granite domes of Colorado and California. The explorers, standing upon the high peak which surmounts the pass, looked to the westward down the great gorge of the Flathead, breaking through the highest interior range; within this gorge Yosemites might be lost. At their feet were spread three mighty amphitheatres, swept clean of débris by recent glacial action; in any of these the population of an empire might find room to watch the manœuvres of two contending armies. West and north a panorama of lofty peaks, covered with eternal snows and streaked with bright, glacier-fed cataracts, was spread before them. The melting snow upon which they stood trickled to the east into two little lakes, heads of one of the most important sources of the great Missouri, and to the west forming a little cascade, which later reaches the Pacific down the channel of the Columbia. A little to the north of their point of observation flowed from these same mountains the young Saskatchewan.

We have dwelt upon the natural features of this region because here, if anywhere, there seems to be an entirely proper opportunity for the Government to establish a great forest preserve. In this region is situated the true dome of the continent, and here the forests are more important in their fluvial influences than in any other part of the country. They protect the snows which feed the three greatest streams of the continent—the Missouri, the Columbia, and the Saskatchewan. The constant flow of these rivers is dependent upon the preservation of these mountain forests. The streams which flow from this region, both east and west, are precipitous and turbulent, and the rapid and sudden melting of the snow which must follow the destruction of the forests would soon convert these streams into dangerous torrents, capable of washing immense masses of débris into the rich valleys which stretch along the base of the mountains. Irrigation under these conditions will be made impossible upon any comprehensive scale, and the valleys and plains of northern Montana, destined, we believe, under wise management to become immense and permanent grain fields, must remain comparatively unproductive.

This whole mountain region can now be set aside as a forest preserve without injury to any one. No settlement exists within its limits; it is one vast, untrodden wilderness, unmarked except by scars, old and new, of great fires, too plainly showing the danger which most threatens the future of these woods. The geological formation does not promise the discovery of gold or silver, and the remoteness of the region still protects it from the invading lumberman. Such a reservation as is suggested can be held and preserved under proper regulations with an almost nominal annual expenditure. It should extend, to be really effective, from the boundary of the United States to the Sweating House River, or to the Salmon Trout Fork of the Big Blackfoot; it should be bounded on the east by the Eastern Slope of the Continental Divide, now within the Blackfoot Indian Reservation, and it should extend west to the North Fork of the Flathead River. Such a reservation would contain perhaps some 8,000 square miles of mountain territory, absolutely unfit for agriculture or grazing, and only valuable as a reservoir of moisture. Here, then, if the Government is to take any measures to protect the rivers of the country, and make agriculture possible west of the 100th meridian by means of irrigation, the experiment can best be tried; here the difficulties to be overcome are less serious, the results to be obtained greater, perhaps, than in any other part of the United States.

THE PARLIAMENTARY SESSION OF 1883.

THE British Parliamentary session just closed has been in itself neither interesting nor eventful. Something less than was hoped at first, yet more than had been hoped latterly, has been accomplished in the way of legislation, but

the bills passed have been of a commonplace kind. They are not the less valuable for that, for what England has needed of late years, and still needs, is the carrying of practically useful but unambitious, non-controversial measures; but they have not excited any feeling among the general public, nor been such as serve either to strengthen or to weaken a ministry. The largest and most important was the act for remodelling the law of bankruptcy, long one of the scandals of English jurisprudence. Next in consequence are the Patents Act, and that for the prevention of corrupt practices and diminution of expense at Parliamentary elections. The Tenants' Compensation Act, though a good deal of noise has been made about it, will probably make little difference to either landlords or tenants, while the Act for making tramways in Ireland and giving facilities for emigration and migration there, though the Government seem to hope for much benefit from it, belongs to a class which experience teaches should be viewed with distrust.

On the other hand, many important topics have been left untouched. The attempt to codify the law of procedure in criminal cases broke down. The long-expected measures for the creation of a new municipal government for London and for the reorganization of local government were not even presented, while the bill for the regulation of river channels and prevention of floods—a matter of the utmost importance to the agriculturists—was never brought as far as into Committee. If Ireland ought not to complain at getting little attention this session, after having absorbed the whole of the two preceding, yet the omission to supply the defects of the Land Act of 1881, or to deal with some other pressing Irish questions, has furnished Mr. Parnell with another argument in support of the doctrine that Parliament does not and cannot give enough time to his country. Scotland makes similar complaints; but as Scotland does not enforce them in the same angry way, and seems to get on pretty well without legislation, her murmurs pass unheeded. On the whole, then, it has been again made apparent that Parliament is at present unable to cope with the numerous and constantly increasing duties which devolve upon it, and that something must be done either to lessen these duties by handing them over to new tribunals or local bodies, or else to invigorate Parliament by reforms in its own procedure which may multiply its capacity and accelerate the progress of business.

The new rules of procedure framed last autumn have made less difference than either their advocates or their opponents predicted. That which was discussed with most passion, the power to close a debate by the vote of a majority, has never been applied. The Ministry who proposed it claim this as the best proof of its efficacy, alleging that the mere fear of it has prevented that obstruction which disgraced several preceding sessions, and culminated in the three days and two nights' sitting of 1881. However, it is quite as likely that the Parnellite party abstained from obstruction this session for different reasons altogether, while that less open obstruction which proceeded from other sections of the Opposition has not been removed, although it was perhaps less frequent and less obstinate this session than in some preceding ones. By another of the new rules, standing committees were established to deal with bills relating to some particular subjects. Such bills were to be referred to one of these committees instead of to a committee of the whole House, and thus the time of the House was to be saved. This experiment, on whose importance Mr. Gladstone often dilated, has ended in an odd way, which no one seems to have foreseen. It succeeded in the case of one committee—that to which the Bankruptcy and Patents Bills were referred—and it failed in the case of the other Committee, which took the Criminal Procedure Bill. One success, however, is worth several failures, and, as the causes of failure can be explained and may be removed, the experiment has, on the whole, been encouraging. The Government have announced their intention of proceeding next year to get standing committees reappointed, and will doubtless succeed in their plan; for the Bankruptcy Act is the most considerable result of the session, and the country knows that it owes the Bankruptcy Act to the Trade Committee.

All the measures mentioned above are Government measures; and in fact legislation by, or rather at the instance of, private members has almost stopped. It is extremely rare for a bill of any consequence, brought in by a private member, to be carried, because such a bill is certain to incur the hostility of some other member, and, under the existing rules of procedure, any one member has practically an absolute veto on all bills which the Government does not push forward. Formerly this veto was exercised with some moderation, and those who at first stopped a bill would usually withdraw their opposition to it when they found that it was approved by the large majority of the House, or by the leaders of the party to which they belonged. Now, however, men have appeared who do not care for the opinion of the majority, and who "block" (as it is called) all bills indiscriminately. Thus it happens that scarcely any measures are carried except those which the Ministry bring in, for they, having a large command over the time of Parliament, are able to override the blocks which these obstructive members place against all bills, while the private member is powerless.

The discussions in Parliament have been scarcely less commonplace than the legislation. There have been few pitched party battles, few debates in which the policy of the Government was arraigned by the Opposition. In only one of these was the issue sufficiently doubtful to raise much excitement. That instance was the debate on the Parliamentary Oaths Bill, introduced to meet the case of Mr. Bradlaugh, by enabling him to affirm instead of taking the Parliamentary oath; and even on that occasion, although the Ministry were defeated, the interest of the event was greatly diminished by the knowledge that it was not to affect the fate of the Government. This want of great occasions has been felt in a want of great speeches, or even of lively party skirmishes. Mr. Bright has not delivered a single oration in Parliament during the last seven months, and though Mr. Gladstone has spoken almost daily and maintained his amazing superiority to every one else except Mr. Bright, he has made only one remarkable effort —viz.: the speech on the Parliamentary Oaths Bill. Nothing considerable has proceeded from any other quarter; no reputations have been made or lost by oratory, for although Mr. Chamberlain's position and influence have steadily risen, this has been the result rather of his skill in the management of the Bankruptcy Bill, and of the constant attacks of his opponents, than of any display by him of rhetorical skill. In the House of Lords it has been much the same.

CROATIA *VERSUS* HUNGARY.

All Croatia, the whole of the Croato-Slavonian Kingdom, has suddenly become convulsed by a violent outbreak of national feeling, directed against the Hungarians—a convulsion threatening to become more important in its consequences than was the succession of earthquakes which, a year or two ago, desolated Agram, the capital of that Slavic kingdom on the Adriatic, and shook the neighboring districts. The causes of the present commotion are not new, and they are deep-seated; but the immediate occasion of the outbreak must appear to the disinterested looker-on exceedingly trivial. Croatia—using this word in the wider sense, which includes Slavonia and most of the former Military Frontier—is, according to the terms of its definitive reunion with Hungary in 1868, autonomous in matters of internal administration, justice, and education, in all of which the Croatian language is the exclusive medium of the authorities; but in affairs of finance, commerce, and communication the supreme management belongs to the respective Hungarian ministries in Buda-Pesth. Now, the present Hungarian chief of the tax department in Croatia has either been instructed, or has thought it his patriotic duty, to place in front of his offices, side by side with the escutcheon of the Croato-Slavonian Kingdom, that of Hungary also, and to affix to his official sign-boards notices both in the Slavic idiom and in Magyar. This so incensed the populace of Agram and other towns that a rush was made for the tax-offices, escutcheons and boards were torn down, the house of the chief tax-director was wrecked, resistance was offered to the police and the troops, and other demonstrations against the Hungarian authorities and nation were indulged in.

The sympathy with the rioters has been general among all classes of the people. The royal Ban of Croatia, the highest representative of the Hungarian crown and of the Hapsburg dynasty in the country, dared not provoke a grave collision by the use of extreme measures, and, when urged by the Government of Buda-Pesth to replace the escutcheons, resigned, and persisted in his resignation, even against the distinctly expressed wish of his royal master, Francis Joseph. The Hungarian Premier, Tisza, demands of the common Austro-Hungarian Government prompt and decisive measures, and threatens to resign in case of non-compliance. The national ardor is

fully aroused on both sides of the Drave, both Magyars and Croats reawakening to the sentiments which animated them in 1848, when Ban Jellachich, working against the former in the interest of the Austrian dynasty, marched his Slavic hosts across that border river and advanced into the very neighborhood of Buda. He was beaten by the Magyars, but they, in turn, succumbed to the army of the Czar in the following year; and there is a lively presentiment, in both Buda-Pesth and Agram, that the present complication may lead to a new powerful clash between Magyar and Slav, in which the Czar may interfere again. The vital difference between the situations of 1848–49 and of to-day is that the Austrian dynasty is now on the side of Hungary, and that Austria-Hungary is backed by Germany. The present troubles are complicated by Socialistic agitations among the peasantry and anti-Jewish riotings on both sides of the frontier.

For a little realm that is neither independent nor populous, nor highly civilized, nor flourishing, Croatia can boast of an uncommonly active political life. It teems with ambitious desires and hopes of annexation, absorption, and national power, the sphere of which is to extend north into Hungary and west into Cisleithan Austria, and on the south to envelop all Dalmatia, Bosnia, and Herzegovina. Such aspirations—based in part on recollections of a remote past, when Croatia, before the Hungarian conquest at the close of the eleventh century, was a more or less independent and extensive kingdom—were already loudly proclaimed at the time when Jellachich placed himself at the head of the armed opposition to the Batthyányi-Kossuth cabinet, fighting for the crown and under the banner of the Hapsburg Emperor. Since then the horizon of the Croat nationalists and the complexion of parties in Agram have often, and sometimes surprisingly, changed. The last phase of the more enlightened patriotic opinion, prior to the present agitation, is clearly reflected in an anonymous pamphlet, 'Austria and the Croatian Question,' quite recently issued in Trieste. The author is a Croat nationalist of the purest dye, but moderate in his partisanship and immediate expectations, and calm in his tone. The pamphlet may be considered the programme of the National Conservative "party of rights," which bases its demands for Croatia on both natural and historical claims, and, faithful to the dynasty, rejects all attempts at forming a union (in the revolutionary sense of the former pan-Illyrian or general South Slavic tendencies) with Servia and Montenegro, which gravitate toward Russia instead of toward Austria. It pleads for the autonomy and unity of the Croats under the Hapsburg sceptre. By this national term, however, it designates not only the 2,000,000 inhabitants of the semi-autonomous kingdom united with Hungary, but also the Dalmatians, the Slovenes of Carniola and of all adjoining parts of Cisleithan Austria down to the Adriatic, and the Bosniaks and Herzegovinians, lately brought under the control of Austria-Hungary. The conviction is expressed that the slight dialectic differences which exist between the different Slavic idioms of Southern Cisleithania and of the Croato-Slavonian kingdom are too trifling to form dividing lines, and that Dalmatians, Slovenes, Bosniaks, etc., are all as willing to be designated "Croats" as by any other collective name which might serve the purposes of national union between so closely related populations of the same empire.

The appellation "Croat," instead of the wider "Illyrian" which gained currency about half a century ago in the terminology of Slavists and Slavophils, is wisely chosen in order to exclude from the programme Montenegro and Servia, independent states, themselves ambitious of leadership among the southern Slavs, and peopled by orthodox Greeks, who are far from inclined to make entirely common cause with the Catholic Croats and their Catholic allies in Austria, though ready to coöperate with them against Magyars or Germans. The plan of the Croat leaders is the formation, within the limits of the Austro-Hungarian monarchy, of a great Slavic kingdom which shall embrace all the Croats (in the widest sense of the word) of both Cisleithania and Transleithania, and form a separate state in the dominions of the House of Hapsburg. This means the substitution of federalism for the present dualism in Austria-Hungary, and the severing of the bonds which have for so many centuries tied Croatia and Slavonia to the Hungarian crown. The Croat programme recognizes the likelihood of this revolution being carried out by constitutional means, and with the common consent of all the parties concerned; but one can read between the lines that what cannot be achieved constitutionally will have to be done otherwise. That the preference of the masses of the people is for force is amply proved by the present acts of violence. The tone of the debates in the late Diets of Croatia and Dalmatia also shows that there is concert between the leaders of the national movement in both divisions of the empire, and that the popular agitation is as harmonious as it is widespread. The Czechs applaud their southern brethren; the Russians, not indifferent spectators, will not hesitate to foment the Slavic movement; but the Magyar statesmen will do their best to stifle it before it assumes dangerous proportions, and, with the help of the Court of Vienna, which is now in sympathy with them, they may succeed. As a beginning, the Ban of Croatia will be superseded by the Baron von Ramberg, the military commander at Agram.

CURRENT LEGISLATION IN ENGLAND.

LONDON, August 16.

THE legislative measures with which Parliament has had to deal this session have had no great interest even for the English public, and are still less likely to engage the attention of American readers. However, before the houses rise, it may be well to say a few words to your readers about the kind of work which has been under consideration, and which is now keeping Parliament sitting until an unusually late period. These measures are, on the whole, of a non-controversial character; that is to say, they do not raise sharp issues between the two great political parties. It was thought better to avoid during this year such party issues, and to deal with topics in whose settlement Tories and Liberals are both, and perhaps to an almost equal degree, interested. The hope was that, by so doing, much important business would be quickly despatched, and a better result obtained from the labors of Parliament than the two preceding sessions had shown. This hope, however, has been but partially realized. The topics were in some cases difficult, and the habit of minute criticism has increased so much of late years that even those of a more simple nature were debated with an extreme prolixity, for which the price is now being paid in the undue prolongation of the session.

Among the many bills which the Government brought in there were six of conspicuous importance. Two of these—that for the prevention of corrupt and illegal practices at Parliamentary elections, and that for giving fuller and more certain compensation to agricultural tenants for improvements made on their farms—were reserved to be dealt with in the House of Commons itself, in Committee of the whole House. Two others—that for the creation of a Court of Criminal Appeal and that codifying criminal procedure—were referred to the large standing Committee on Law and Courts of Justice, commonly called the Law Grand Committee; while two more—the Bankruptcy Bill and the Patent Law Amendment Bill—were similarly referred to the other Grand Committee—that of Trade and Manufactures. The fates of these six have been very dissimilar. The two last mentioned were very fully examined by the Grand Committee on Trade, amended in many respects, and accepted by the House with general approval, so that hardly any changes were made in them when they passed through what is called the stage of report. Both are good measures, and though, after so many previous failures, it would be rash to predict success for any bankruptcy bill, this one seems to start under better auspices than its predecessors. Mr. Chamberlain, who, as President of the Board of Trade, was responsible for the framing of it and for working it through Committee, has won golden opinions by the quickness and tact which he displayed in that troublesome and fatiguing duty.

The course of the two law bills has been less prosperous. The Court of Criminal Appeal Bill passed its second reading with little objection, apparently because everybody thought that, after the often repeated demands for something of the kind, it was a matter of course to try the experiment. When its provisions came to be considered in detail the difficulties with which the subject bristles began to be felt. The Committee cut the bill about a good deal, but in the opinion of many of our most sensible lawyers the more they changed it the worse it became. The Government declare that they intend to pass it, restoring it in some respects to its original form. But the session has now only eight or nine working days to return; there is a good deal of opposition to the measure and very little zeal for it. Most of the judges are known to disapprove it, and it is quite possible that even if it is forced through the House of Commons, it will perish in the House of Lords. Still more inglorious were the fortunes of the far more ambitious measure which was intended to codify the whole law of criminal procedure. It was originally drafted some six years ago by Sir J. F Stephen, now one of the justices of the Queen's Bench Division of the High Court of Justice. It was then submitted to two of our most skilful lawyers, Mr. Justice (now Lord) Blackburn and the late Mr. Justice Lush, afterward a Lord Justice of the Appeal Court. They altered it in many points, and handed it over to Sir John Holker, then Attorney-General, who gave it a further polish, and intended to get it passed in the session of 1879. However, he had to drop it, nor was the present Attorney-General any more successful

in 1881 and 1882. This year it at last advanced to a second reading, and was sent, with good expectations of success, to the Grand Committee. When it came on there Mr. Parnell and several of his Irish allies objected to some of its provisions as unduly severe and despotic, and found some support among a section of the Liberals who sat on the Committee. After a while obstruction began, and then it was clear that the bill, which the law officers of the Government did not themselves wholly like, as it was really not their work but that of judges from whose views they differed in important points, could not be carried. It was accordingly abandoned, and is not likely to be taken up until the attitude of the Irish Nationalists alters; for at present they can, as indeed any other small but resolute section can, arrest the progress of any measure which has not the full force of the Government to push it through.

There remain the two bills which were handled in Committee by the House itself—Corrupt Practices, and Compensation to Agricultural Tenants. The former dealt with two old scandals of our politics. One is the existence of bribery, treating, and undue influence at our Parliamentary elections, for which evils the bill provided heavier penalties and new prohibitions. The other is the inordinate expense of elections, amounting in most large constituencies to sums varying from two to seven thousand pounds for each candidate. In one case, at the election of 1880, two candidates running together in the same interest spent between them £13,000 sterling. This lavish expenditure is not necessarily illegitimate—that is to say, bribery need not form a part of it—but it has a demoralizing effect on the constituencies, and it goes far to exclude men of moderate means from a seat in Parliament. And though it is a less serious plague than corruption, it spreads more widely, for whereas there is very little bribery in constituencies where the number of voters falls below five thousand (most, if not all of which will probably cease to exist when a measure for the redistribution of seats has been carried), the cost of elections is usually largest in the large constituencies, and especially in the populous counties. The reduction of expense is indeed the main object of this bill, which took several weeks in passing through Committee, so anxious were members who felt it might affect themselves to scrutinize all its provisions. It is a piece of work which had to be done, but the country was not profoundly interested in it, and will hardly give the Ministry very much credit for it. The last of their larger measures is that intended to benefit the farmers by securing to them more adequate compensation for agricultural improvements. Many people have asked why such a provision need be made by law at all. "Why cannot" (people say) "a farmer be left to make his own bargain with the landlord when he wants to build a wall or drain a meadow, or put some valuable manure into the land? He need not make the improvement unless the landlord promises compensation, and now that agriculture is depressed, and many farms lie unlet in the hands of the land-owners, it is the landlord's interest to do all he can to encourage and retain an improving tenant." However, it seems to be a maxim accepted by everybody concerned with British agriculture that landlords won't promise sufficient compensation, or that tenants won't improve on anything less than a certainty given by law that they shall have back, when they leave the farm, the value of whatever they have done for the land; and thus the present bill has met with little opposition from any section except two—a very few doctrinaires (as their opponents call them) who insist that perfect freedom of contract is the only safe principle to follow, and a somewhat larger party among the radical "farmers' friends," who complain that much more ought to be done for the agriculturist than the bill does. Of course, the landlords as a class dislike it, but they hardly venture to show their hostility, for fear of losing the farmers' vote at the next general election. But for this feeling the Conservative majority in the land-owning House of Lords would no doubt have thrown out the bill. As it is, they have confined themselves to cutting it down by amendments, with which the Lower House is expected to disagree, and which the Lords will probably end by abandoning.

Y.

THE DEBATE ON THE ADMINISTRATION OF JUSTICE IN IRELAND.

DUBLIN, August 18.

IRELAND is not governed in accordance with the public opinion of its people. There is, therefore, something particularly unfair and ungenerous in the outcry the British press are raising against our representatives for having in Parliament last Monday insisted upon a full discussion relative to the administration of justice in this country. It was about the only real protest upon this portion of the case they could make during the session. The liberty of effective question and debate has, as you know, been very much curtailed, but the right of fully discussing the estimates remains, and this was availed of in a sitting which commenced at 4 in the afternoon and was not concluded until near daylight next morning. At the worst, the acerbity of such occasions has been considerably softened since the dark days of Mr. Forster's unhappy régime. Mr. Trevelyan makes a wiser and more conciliatory Chief Secretary. In the *Freeman's Journal* of late have appeared a series of articles on "Parliamentary Progress," believed to be from the pen of Mr. Sexton, one of the ablest and most uncompromising members of the Irish Parliamentary party. In one of these articles occurs the following passage concerning Mr. Trevelyan's attitude during this and other debates of the week: "It is only fair to acknowledge that his speeches show admirable self-control and a splendid temper. In spite of the many fierce rencontres of the session and a half since he took office, he can never be said to have created a scene, or to have said any of the rancorous or boorish things that made his predecessors so hateful and so hated." (Would that the like could be said of our members!) Then follows a remark ominous of what might result to the spirit of Home Rule if all British statesmen and legislators were like him: "For these reasons, perhaps, Mr. Trevelyan may be pronounced a worse and a more dangerous Chief Secretary than Mr. Forster."

But to return to the debate. In the government by however enlightened an autocracy of a people of Anglo-Saxon blood, there will inevitably result more injustice than under a free Constitution, and a proportion of innocent individuals is certain to be swept in with real offenders. The speeches of the Irish members were for the most part an enumeration of such cases of wrong to the innocent or of undue punishment of offences. There was much exaggeration, but there is nothing in the speeches on the Government side to clear away the impression that there is a substantial basis of truth for these allegations. Mr. Parnell was in his best style, widely different from the irresponsible attitude and utterances of his earlier days. No other member of the party has so matured; and upon no other member of the party would it be wiser for the Government to force, if I may use the term, responsibilities. He dwelt upon some cases of injustice like that of Mr. McHugh, "who has spent the last four years of his life in Irish prisons awaiting trial, and has been acquitted by a jury of the only charge that the Government could bring against him." "I say we don't attack the Government for bringing criminals to justice, and criminals have been brought to justice and very properly punished; but we attack the Irish administration because we know that innocent persons have been condemned and have been actually executed, and because at the present moment there are many innocent persons suffering penalties for offences which they no more committed than the right honorable gentleman himself. I would ask the Government one question: Do they think that by the enactment of the Crimes Act or its administration they have advanced one single inch nearer to that which ought to be the endeavor of all governments in any country? Do they think they have advanced one single step nearer to gaining the respect and assistance of the Irish people?" Mr. Parnell's accusations are true in the main. We must, however, acknowledge that the powers conferred by the Crimes Act have enabled the Government to expose outrage and crime to such an extent as to compel many thoughtful Irishmen to revise their theoretic opinions regarding withholding assistance from the Government under all circumstances. Considerations higher than politics or country will compel many for the future more practically to discountenance outrage and ruffianism than has been done in the past.

With the bitterness that exists between the countries, it is inevitable that strong and coarse language and exaggeration should be used by some of the men chosen by Ireland to represent her in Parliament. There is little use in lamenting this fact. There it is—an undoubted weakness in the Irish Parliamentary party and an impediment to the reforms which it advocates. We must, however, acknowledge that a nation can better endure being hated and disliked than neglected and despised; and until within the past twelve years Ireland, represented by none but quiet, college-educated, club gentlemen, if not despised, was at least neglected, unless in a patronizing way. It is so easy for gentlemen with all the money and troops at their backs to be dignified, and so difficult for men who have little but their tongues to depend on.

There is, nevertheless, something sickening to an Irishman in the exaggeration, if not deliberate misrepresentation, at times indulged in by Irish members and patriots. We blush for our friends as we should not blush for our opponents. I wish that Mr. Healy and others could realize the deep humiliation and shame they often cause to men who have learned to respect and love them in many relations. The heads of a few emigrated families lately fell victims to sunstroke in the United States, and the destitute members had to be sent back to Ireland. Whereupon Mr. O'Brien (M. P. for Mallow) asks the Chief Secretary: "I would like to know whether an indictment for manslaughter would not lie against the Emigration Committee for having lured them away from their homes?" It was highly proper that Mr. Healy should bring forward the case of Mr. George Bolton. It is not right that the Irish people should be taxed, without their consent, to support such an official; but Mr. Healy scarcely showed good taste in asking whether he "was not the most blackguard and profligate ruffian in the service of the Crown." (It would, to be sure, have been awkward for the character of the Irish service if Mr. Trevelyan had denied Mr. Healy's accusation.) This case of Mr. Bolton is, however, a shameful and typical case. If Ireland is to be ruled autocratically, at least it behooves the Government to look rigidly into the character of its instruments. If im-

poverished and swindled people infringe the law while trying to keep their families together and hunger from the door, at least a high moral standard ought to be required in those appointed to prosecute and judge them. It is one of the inevitable cankers in a system of arbitrary government, however well intentioned, that it must as a rule implicitly trust its instruments as against the people, no matter what the circumstances may be. And so it has come to pass here that a man of the most unblemished character, like Mr. George Fottrell, has been impelled to resign a responsible office in the Land Court, for which he was specially fitted, simply because he made the slip of acknowledging in a Government pamphlet that the Land Act was partly the outcome of the Land League agitation; and a man like Mr. George Bolton is retained in office after the shameful disclosures regarding his honesty and morals before the Probate and Divorce Court in London last February. I have turned up the *Times*, and confirmed my impression that while Mr. Healy used exaggerated language, the Government makes a fatal mistake in retaining Mr. Bolton in his Crown-Prosecutorship. I hope American citizens will never have to endure the humiliation of submitting to an official whom they have reason to condemn and despise, and who is retained in his post against their wishes.

Commenting upon the attitude of both parties in the debate, the *Pall Mall Gazette*, Mr. Morley's paper, says: "What would it not be better for an Englishman to bear than to meddle with the government of Irishmen, whether landlords or Nationalists? Of all tasks our vast Empire imposes, none can be so thankless as that. The round of wrong is interminable. If there is not a terrific agitation, the Legislature will not attend to Irish grievances." The treatment of Irish debates by the general British public is illustrative of the situation. We are governed not by the majority of Irish, but by the majority of British members, who are influenced not by Irish, but by British public opinion. During a debate such as the important one I have named, all but a handful of British members leave the House. The majority do not want to be bothered by Irish any more than by Indian details. They are safe to be called in to vote by direction of their whips, or to make a House any moment by electric bells and special messengers; and the British newspapers give only meagre reports of the proceedings. The debate filled nine columns of the *Freeman's Journal* (reducing the actual amount to compare with the closer-printed British papers). It is true the *Times* (a three-penny paper) gave it five and a quarter columns; but the *Standard*, *Daily News*, and *Telegraph*, the great penny organs of British Conservatism, Liberalism, and the middle classes, devoted to it only two and a quarter, one and three quarters, and one and a quarter columns respectively. Some may attribute this brevity to the supposed loquacity and unreliability of our members; but similar cases occurred in the old "respectable" times.

Let me conclude by enumerating a few topics in which the relations between Ireland and the Government have been of a more pleasing character. Some of them I may revert to upon future occasions. (1.) Please the House of Lords, there is every likelihood the Irish Registration Bill will pass this session. It will remedy injustices and anomalies under which Irish voters have been laboring, and it will considerably strengthen the popular vote. (2.) The Government is showing itself reasonable in the matter of migration, of which I wrote last week. £50,000 are likely to be devoted to an experiment in that direction. The sum granted to individual emigrants is to be increased. It will be interesting to watch this migration experiment, and we must earnestly desire that it may be worked in such a manner as to prove that failure—if failure should unhappily ensue—will be due not to Governmental red tape or prejudice, but to the inherent difficulties of the problem. Mr. Gladstone's wisest course would be to throw the whole responsibility of the experiment upon those who have advocated migration. (3.) Every desire is being shown to make the introduction of tramways in the West a success and a real benefit to the people. (4.) The Agricultural Laborers' Bill is likely to pass. (5.) The Government have consented to place a portion of the Ashburnham Irish Manuscripts, lately purchased by Imperial funds, in the Library of the Royal Irish Academy. (6.) The Irish clauses of the Bankruptcy Bill have, in deference to the opposition of Irish members, been abandoned. (7.) The contract about to be concluded some months ago with the London Northwestern Company for the conveyance of the mails between Dublin and London was cancelled in the face of the arguments advanced against it by the Irish public. New tenders were called for. The City of Dublin Company has secured the sea contract, and their fine vessels, so well known to voyagers between England and Ireland for the past twenty years, are to be rendered still more powerful and complete. (8.) The Government have had to withdraw an opposed Irish Constabulary Bill.

Dublin National opinion is considerably exercised against the Wicklow Railway for refusing to carry out an agreement relative to a "Monster excursion to Avondale, the seat of Ireland's patriot, Charles Stewart Parnell, M. P." Castle influence and all sorts of class and political motives are alleged. I have taken some trouble to inquire into the matter, and am convinced of the absurdity of these allegations. The company, while it might have been more explanatory and polite in its cancelling of an agreement, was, I believe, solely influenced by a desire to avoid accident—the excursion having swollen to dimensions beyond the capacity of the rolling-stock for extra Sunday traffic at this time of the year. It gave a week's notice of its decision, and offered to pay the expenses the managers of the excursion had incurred. The imbroglio is not without its ludicrous side: last Sunday, the day appointed, was miserably wet and unpleasant, and a vote of thanks, rather than abuse, is due to the company for having saved the intending pleasure-seekers a disagreeable excursion. D. B.

THE FRENCH IN INDIA.

PARIS, August 17, 1883.

IT is very difficult to find out how the desire for a colonial empire has suddenly taken hold of the Republican rulers of France. The origin of the expedition to Tunis can be traced to conversations between the German Chancellor and certain French ambassadors. It is obviously the interest of Germany that France should spend her activity in many ways and undertake many difficult tasks; what is more surprising is the readiness with which the projects in Africa, in Madagascar, in Senegambia, in Tonquin have been adopted by the party now in power. These great schemes have given an additional interest to the history of French colonization. The history of our Canadian colonies has been admirably told by an American writer. I have now before me a curious work on Dupleix, from his inedited correspondence. It is entitled 'An Essay of a French Empire in India in the Eighteenth Century.'* The author, M. Tibulle Hamont, justly remarks that we have only vague notions on the conquest of India by the French in the last century, and that France has almost forgotten the extraordinary figures of Bussy and Dupleix. "Little do people know," says he, "that, in order to arrive at the domination of India, Dupleix invented and put in application a vast and safe political system which the English have servilely copied, and by means of which they have subjugated the agglomeration of Buddhist and Mussulman peoples which live between the Himalayas and Cape Comorin." The documents on Dupleix are the various "memoirs" published for and against him; the collection of letters and papers left to our National Library by M. Ariel, archivist in Pondicherry, relating to the quarrel between La Bourdonnais and Dupleix; a manuscript history of the conquest of the Deccan, written by a nephew of Dupleix, and preserved in the library of the Arsenal; and the complete correspondence of Dupleix, preserved in the archives of the prefecture of Versailles—a correspondence which had been forgotten and ignored up to the present time.

Dupleix was born the 1st of January, 1697, in the French Hainaut, at Landrecies, a small fortress of the valley of the Sambre. His father was a *fermier-général*, a hard, avaricious man, who sent him in 1715 to India, on a ship of the East India Company. The young man was well received by the Governor of Pondicherry, Lenoir, who soon made him his secretary. Dupleix received in 1720 the title of "Commissaire des guer[illegible]. He saw that the financial system of the French Company was wrong. The Company imported no goods into India; it merely exported Indian goods, for which it had to pay in silver. Dupleix understood that this system could not lead to any great development of trade. In 1730 he was appointed Governor of Chandernagar, and introduced in this colony the system of a double commercial circulation, making advances himself to the merchants. His house became a sort of a bank; Chandernagar became rapidly a centre of trade. The results of Dupleix's policy struck the Company so much that in 1741 the directors appointed him Governor of Pondicherry, which was the highest post in the colonial hierarchy. The Governor was a sort of viceroy: he commanded the military forces, and had an immense patronage.

Dupleix knew that everything in India depended upon the succession of the Great Mogul. Would India be split in pieces, and fall into the hands of the nabobs? or would it fall under the rule of the warlike Mahrattas? He felt that a European competitor would succeed, and he hoped that France would make the attempt. He clearly understood that a superior race would easily become dominant: India would belong to those who had most prestige in the eyes of the feeble races of the peninsula. All depended, therefore, on the result of a war between England and France, which he judged inevitable, and at the same time on the position which the French Governors would assume toward the Indian populations. He did not wish to appear as a merchant, speaking in the name of merchants; he presented himself as an officer of the Great Mogul, taking advantage of the title of nabob which had been given to the Governors of Pondicherry. He surrounded himself with Eastern pomp; he tried in every way to strike the imagination of the East Indians. The Indian armies gave him no alarm; he was sure that these multitudes would not stand before a small French army, well drilled and led by good officers. The duel with England was his great preoccupation. England once defeated, the foundation of an immense French empire became only a question of time. Unfortunately

* *Un Essai d'empire français dans l'Inde au dixhuitième siècle*: Dupleix, d'après sa correspondance inédite. Paris: Plon; New York: F. W. Christern.

for Dupleix, the Company had no sympatby with his vast plans: it cared for nothing but money, and did not understand that the success of Dupleix's policy would procure for its shareholders unlimited sources of wealth. La Bourdonnais, a Breton and an excellent sailor, was Governor of the Île de France when the war broke out between France and England; he had to send a squadron to India, in order to relieve Pondicherry. His difficulties were numberless, but he succeeded; and notwithstanding Peyton's fleet, he succeeded in bringing his reinforcements to Pondicherry, where Dupleix received him with open arms. Unfortunately, Dupleix and La Bourdonnais could not live long in harmony. La Bourdonnais was jealous, uncontrollable, violent. Dupleix wanted to concentrate all the French efforts on Madras and the neighboring fort of St.-David. La Bourdonnais took Madras, but consented to accept a ransom for the place. He resisted the orders of Dupleix, and by the terms of a treaty engaged himself to replace Madras in the hands of the English for a sum of 1,100,000 pagodas. Dupleix considered this conduct an act of high treason. La Bourdonnais left with his fleet, and Dupleix remained alone, almost defenceless, and with the most terrible responsibilities. He had no longer any fleet; the English squadron was intact; Madras and Pondicherry were in danger; all the agents of the Company longed for peace. Dupleix remained calm. He saved Pondicherry; he inflicted a defeat on the army of the nabob. The Hindoos began to look on him as a demigod. He learned that peace had been concluded, and that the treaty of Aix-la-Chapelle had definitively given Madras back to England. He had, nevertheless, firmly established his hold on the Indian soil and on the Indian mind.

Delivered from the fear of a continual struggle with England, Dupleix began to prepare to intervene in the affairs of India. His plans were very simple: he meant to rule India by means of a native Prince. He kept a little army of 2,000 Europeans and 4,000 sepoys, and had good artillery. He seized the first opportunity which was presented to him, and took the part of Mirzapha Jung against a rival. Nazir Jung invaded the Carnatic with an immense army. He had eight hundred European soldiers, commanded by a Major Lawrence; and though France and England were at peace, English and French were on the point of fighting, since Dupleix declared himself against Nazir Jung. "It is singular," wrote Dupleix, "that these people (the English) should prefer to the alliance of a great monarch the alliance of a wicked negre. But how can they resist the offer of 100,000 rupees? Lawrence has shut his eyes to the interest of his country as well as to the breaking by unauthorized subjects of the most solemn alliances. . . . And so two subjects who in Europe would hardly be lieutenants have the audacity to declare war on the King of France. The thing is laughable."

Dupleix, understanding that the English would bring Nazir Jung before Pondicherry, threw all his available force before this place. He knew his own allies, and feared that they would easily make a separate peace. He himself began to negotiate with Nazir Jung. In the midst of the negotiation some French officers rebelled against their chief, d'Auteuil; his allies were surprised, and one of them, Mirzapha Jung, surrendered himself into the hands of Nazir Jung. D'Auteuil had to fall back on the walls of Pondicherry. Dupleix gained time by writing letters to Nazir Jung, made him presents of brandy, and one night sent a little column into the Hindoo camp, which struck terror into the whole army. The forces of Nazir Jung fled in all directions; he himself ran away on horseback, and his English soldiers retreated to Fort St.-David. One night had changed the whole situation. The campaign of Nazir Jung, begun with so much noise, and ending in a disastrous flight, is typical of the operations conducted by the Indian princes. Dupleix knew how to use victory: he completed the conquest of the Carnatic; Nazir Jung was killed in battle on his elephant, Mirzapha Jung was delivered. On the battle-field he came down from his elephant and offered his thanks to Bussy, the lieutenant of Dupleix. Mirzapha was proclaimed ruler of the Deccan, and crowned in Pondicherry with great pomp. Dupleix had now found his instrument: he had placed his vassal on the throne of Golconda; France was giving the investiture to the heir of Nizam al Mulk. Mirzapha asked Dupleix to lend him an army for the conquest of the whole Deccan, and was killed in one of the battles which he had to fight against some rebel nabobs. Bussy proclaimed a new subadar, and his choice was confirmed by Dupleix. Bussy was a good soldier; he was also a good diplomat. He made himself a sort of incarnation of Dupleix, and helped to maintain him in the high position where he now stood. Dupleix was nabob of the Carnatic; the immense Deccan obeyed him.

The English had lost their prestige in the eyes of the native rulers. Mehemet Ali was not vanquished; he still held Trichinopoly. Dupleix despised him, but his fortunes were lost on this little place. The history of the siege of Trichinopoly is well known; the fate of millions of men was decided in this contest of a handful of men. The names of Clive, of Lawrence, of Law are the familiar names of this drama. The French arms suffered a total disaster. The capitulation of Law left Dupleix without a single soldier; his ally Chunda-Sahib had been assassinated; the French victories had been an idle dream, and all was lost in a day. Dupleix did not despair; he counted on dissensions between the native princes and the English; he counted upon the help of the Company; he refused to treat after a defeat. He sent d'Auteuil to France to open the eyes of the French Government to the situation of Indian affairs. "It is necessary that the Ministry should act, that the King should give orders, that he should take care of his glory, of which the Directors do not seem to think. . . . You are not ignorant that the English are sending forces to India." He asks for men, for ships. Mme. Dupleix, his wife, gives to d'Auteuil magnificent presents for Mme. de Pompadour; she says, in a letter to her nephew, who was to give the presents, that he must keep them if the Marchioness is no longer in favor. Who thought in France of Trichinopoly? Who had ever heard such a barbarous name? Who cared for nabobs and subadars? The Directors of the Company never spoke of anything but peace, neutrality, non-intervention; they were merchants. The two Companies, the French and the English, had a negotiation over the head of Dupleix. The English asked for the recall of this troublesome Governor of Pondicherry, who undertook to ruin all their schemes and to place India under a French protectorate. Dupleix was sacrificed; a successor was named for him, Godheu, who came to India and sent Dupleix home. Godheu represented peace at any price. Dupleix, who could have made millions in India, who had all the treasures of Golconda at his feet, spent the last years of his life in vain struggles against the Company. He left India with a small sum which he had to borrow from his successor. He died poor, and, what is worse, he died misunderstood, with the feeling that his country had never even known what he had wished to do for her. His sacrifice had been vain. Even now his name is not one of the popular names of France; the great triumph of England in India has acted like the sun, which makes all other lights look pale.

Correspondence.

BUSINESS AND WAGES.

To the Editor of The Nation:

Sir: I have read your comments upon the varying features of the telegraphers' strike, and have remarked the accuracy of your statements of the common sense of the situation as customarily viewed by the mind of the established class, given to what is practical rather than reformatory. This voicing of the futility of effort against what seems inevitable awakes a feeling of gratification. It is agreeable to see men who live by wages adapt themselves to the facts of business, instead of risking their livelihood by rising against the stubborn realities. If wages are inadequate, and yet are adjusted by the law of supply and demand, it looks indeed properly assertive of a freeman's right to happiness for the employee to "ask for more"; but, upon refusal and the evident absence of a prospect of success in an attempt to strike for a rise, it looks self-contained quietly to submit. As we pass and see the operator at the battery, we may think: "Blessed are the meek, for they shall inherit the earth."

And who has not experienced the feeling of admiration for the capitalist in his power dictating terms to the unestablished class with the ready common sense that takes advantage of abundant supply to a small demand? It is one of the successful elements in fiction that such power is portrayed in a way to ensnare our disposition to put ourselves in the place of him who exercises the power. We are inclined also to remember—with a sense of the enslaved condition of the drifting masses, and yet with a half-conscious recognition of their impecunious state that makes us jeer at the Pickwickian advice—the famous admonition of Horace Greeley to the "young man." The capitalist is powerful, and yet he cannot enslave; but with his power he excites an Americanized form of the old Roman admiration that once moved in the spectators when looking on a triumph. The power is due to an achievement in the world of business. The man is a conqueror home with his trophies from subjugated domains. We do more than consent to the laws that hedge him from the pretension of communism.

And it is right we should do more. The man who achieves fortune and invests capital in railroads and in telegraph lines helps others while helping himself. There is something admirable in the uncomplaining silence of these men before the people's lack of appreciation for the public accommodations furnished, usually at an endurable rate and with consideration for safety and despatch. The rule of doing to others as you would that they should do to you, which mingles with the rule of business that requires pay for services rendered, is wondered at, like "Pan in Wall Street"—not often admired, if at all noted, by the public that steps into a movable drawing-room at one town and presently gets out at another. Generally the thought is: "These men are making money out of us." And he who would in Boston communicate with his wife in Denver runs into the telegraph office, throws off his message with due care to keep the words down, pays the bill, and goes out again as hard toward the monopolist as the monopolist is to him. Everybody save the wage-receiver appears to be led by circumstances out of all sympathetic dispositions into that common sense of custom which you have been voicing in your comments upon this telegraphers' strike.

And yet nature, like Pan, creeps in amidst the story places and the preoccupied bustling throng —creeps in from among the strikers and stands wondering, and wondered at, amidst the magnates of business—to say that the law of supply and demand is not the law of justice; that an agreement, forced by stress on one side and power on the other, is not a covenant of humanity; that money need not be mammon; that the employer is bound by a higher law than that of business to be concerned for his employee as for himself; that, though money will always be rightly distributed in disproportionate measure, yet the hired helper should be enabled to lay up money without discomfort, and to find ease and enjoyment in a world as bright as this one is; that the common sense which is of business has lost in soul because it comes from a heart that says: "I have made my way: let others make theirs."

This last is an argument to which a capitalist might be led to resort through thinking that it involved a feeling of real benevolence, in that it implies that stimulus must be given to self-reliance. How must appear the wage-earners to these stirring men? The man who has done great things is like that character of whom Charles Reade tells in one of his short stories: "These qualities [fortitude and sagacity] he possessed, so he thought nothing of them." This being so, they naturally think everybody else could do what they do, provided everybody else was not so lazy. But the difference between them and the rest is that they have a faculty which the rest have not. And I think that the way to a reform in wages, such as will remove all probability of strikes, is to convince the capitalists of this fact; for at present they are not unnatural, and are only mistakenly disposed to be disdainful of men who do not bestir themselves to go and do likewise. W. W. T.

TYNGSBORO', MASS., August 28, 1883.

GREEK AT HARVARD.

TO THE EDITOR OF THE NATION:

SIR: The controversy over the oration of Mr. Charles Francis Adams, jr., before the Phi Beta Kappa Society seems to have been the outcome to a great extent of a mistaken idea as to the speaker's real meaning. That Mr. Adams intended to advocate the entire rejection of classical studies, and the substitution in their place of so-called "practical" studies, seems to me to be far from the truth; and yet this is taken as the basis of most of the arguments against his oration. It is a still greater mistake to assert, as the *Nation* does in its issue of August 16, that Mr. Adams's grievance lies in the fact that he himself was unable successfully to acquire a knowledge of Greek. The solution of the question lies in a consideration of the quality of instruction given at Harvard, and a comparison between the methods of Mr. Adams's time and those of the present day.

The studies of the last three years at Harvard are elective, and the student is then supposed to select such courses as will be for his advantage in after-life; and I believe that in a majority of cases this consideration is not overlooked. Greek stands near the head of the list in the percentage of students who elect it, and this is due, to a large extent, to the fact that the admirable organization and ability of the Greek department enable the student to acquire, not a smattering of the language, but a firm foothold, which will be to him a source of pleasure and profit. But before the elective system came into use, the study of Greek was compulsory upon all students, and the professors, being assured of full classes, took no pains to make their instruction thorough or even interesting. The effects of this method may be seen even now in the required work of the English department. Rhetoric, theme and forensic writing are the bugbears of all students, and the main object in the writing of a theme or forensic is to fill out the required amount in the shortest space of time. In direct contrast with this required work are the theses which candidates for honors are allowed to substitute for forensics. All of these show, by the interested and thorough research of the writer, that they are not perfunctory tasks, but entertaining and valuable work. It is true not only of Greek, but of every branch of study, that the methods of instruction have more to do with the student's success than any other thing. I do not claim for the business man any practical benefit from the study of classics, but I do claim that such methods of instruction as are in use in the Greek department at Harvard will give him as much, if not more, mental discipline than can be obtained from any other branch, while for the professional man a direct practical advantage is gained.

It is an open question as to whether a man ought to pursue at college a course which will have a direct bearing upon his pursuit in life. Be this as it may, I believe the study of Greek and Latin has a value which the man who chooses a profession cannot afford to lose. Doctor Humphreys, of Boston, a teacher of long experience, has hit upon a true estimate of this value. Latin and Greek form the basis of our scientific nomenclature, and it must be admitted that a knowledge of them is a very great assistance to professional study. Without this knowledge the acquisition of terms becomes an effort of memory, and is at best a dull task. Further, the names convey no meaning to the student, whereas if he were acquainted with their origin and derivation, it would require no effort to acquire and retain them. This is a consideration which should not be overlooked, and it cannot be denied that it is of practical value, and of no small value, too.

This advantage is one to be gained by the advanced methods which the Greek department, and to a less degree the Latin department, at Harvard now give—not a forced smattering, as was formerly the case, but a thorough and solid foundation. This much, as I have said, nobody who aims at a profession can afford to neglect; but I believe there are only two classes to whom a careful and critical study of the details of the classical languages is a benefit. These are, first, those who intend to become teachers, and, second, those who have the time and inclination to devote themselves to literary work. Mr. Adams denies that the classical literatures have the beauties attributed to them; but I must believe it is his imperfect knowledge of the subject which leads him to this assertion. The literature of the present day is largely imitative, and, if we trace it back to its originals, we find the mainspring in the Greek.

A RECENT GRADUATE.

SOUTH HANSON, August 28, 1883.

THE DOMAIN OF LEGITIMATE CRITICISM.

TO THE EDITOR OF THE NATION:

SIR: Four journals have done the *Book Notes* the honor of noticing the criticisms of McMaster's 'History' published therein. Among these may be mentioned the communication signed "J." in the *Nation*. Concerning the disfranchisement of the Cincinnati, this writer says: "While McMaster gives in the text his own opinion, that the Cincinnati were disfranchised, he gives in the note his authority in full, from which any reader may see that the disfranchisement was only proposed when the writing took place. Here, also, there is no danger of any mistake on the reader's part, and that is the essential point." From all this I beg leave to differ. McMaster says (p. 173): "Rhode Island disfranchised such of her citizens as were members of the Order." In a foot-note he gives as his authority a quotation from a newspaper published in Philadelphia, as follows: "We hear that the State of Rhode Island is determined to disfranchise any and every person who is a member of the Order of the Cincinnati, and render them incapable of holding any post of honor and trust in the Government." Here are two distinct and different statements. First, McMaster says that a certain thing was done; and second, his authority says it *hears* that a certain thing is *to be* done. It is absurd to make a positive historic statement, as McMaster has done, on such evidence as that is. How is any one but an expert to know which, if either, is correct? The truth is, *neither* statement is correct. Rhode Island never even proposed to do any such thing, much less did it. Both the statement in the narrative, and the authority as well, are false. It is because this writer has relied upon just such stuff as this that I distrust his book.

The second of the *Book Notes*' criticisms is, if maintained, far more serious than this. The charge is that a certain *proposed* act is so stated and discoursed upon as to leave upon the mind the belief that it is an accomplished fact, and very derogatory to Rhode Island, whereas no such facts existed. "J.," in the *Nation*, says he cannot see how this charge can stand. Let us show him. Page 339, McMaster, says: "The members [of the General Assembly] then went on *to do the worst act* of their lives. It was felt that a new forcing act must be passed, and that the new one must be stringent. An iron-clad oath, to which the name of the test-oath was given, was accordingly framed and brought in. Every man *who took* this oath swore in a most solemn manner to do his utmost to support the paper bank. . . . A long list of penalties *was provided* for those who did not take the oath." "Ship captains were *forbidden* to come in *or go out* of the ports of the State till they had taken the oath. Lawyers were *not to practice*, men were *not to vote*, politicians were not to run for office, members of the next Legislature were not to take their seats till they had, upon their solemn oaths, declared that paper was as good as gold. In this form the *law* went before the people." Mr. McMaster gives as his authority for all this two newspapers, the New York *Packet* and the *United States Chronicle*. Now, I maintain that to this point McMaster has impressed upon the mind of his reader the idea that all these things were accomplished facts; whereas they were no such things: they were all only propositions submitted to the people. No such law was ever made; no shipmasters, nor lawyers, nor members, nor anybody else, ever took the oath, or were ever asked to. It was simply a monstrous proposition. McMaster then proceeds to inform us that "it seemed likely that a number of rich merchants and prosperous tradesmen would pack up their goods, desert their homes, and remove to a neighboring State." Just as if such men, at the mere proposal of a bad law, would take such serious steps. Nothing whatever of the kind took place: it was simply heated newspaper talk. We are then informed that town meetings were held, and that three towns instructed their delegates to support it (the law—which, however, had never been enacted into a law). He does not inform us that twenty-seven towns instructed their delegates to vote against it; he gives the names of the towns which supported the proposition, but not those which were opposed to it. He further says: "In November the Forcing Act was

thrown out by an overwhelming majority." Now, I maintain that the impression upon the reader's mind is, all through, that this proposed law was a real law; that for a time the people labored under it; and that, at a subsequent meeting of the Legislature, it was repealed: all of which is untrue, and no part of the history of Rhode Island.

Nor is it a part of the history of the *people* of Rhode Island which McMaster assumes to have written, because these people lived in thirty towns. When asked if they wanted these monstrous propositions enacted into a law, only three towns out of the thirty said yes. The people were against it almost unanimously. McMaster does not so inform us.

That I have confined these inquiries to two distinct points, is not because I have exhausted the field. If the defence of my State or myself requires it, the whole book will be examined, but these two specimens are characteristic of the work.

I maintain, what I before said, that, so far as this State is concerned, this 'History' is indeed valueless, for only an expert would be able to detect the true from the false. But, if such things are true with regard to Rhode Island, why may they not be just as true with regard to other States?

A word more, and I have done. "J." contemptuously calls these things microscopical and of no consequence, and says that in spite of them this history is the best, covering the period, ever written. To say that this work is the best ever written, may be a very polite way of saying a very severe thing concerning those histories of its class which have preceded it. To understand the force of such a phrase, one must possess an accurate knowledge of those which preceded it. *What has* preceded it?

In a certain sense, everything is microscopical—any single thing is of minor consequence; but, in my humble judgment, these things come within the domain of legitimate criticism. They misrepresent the history of a people, and are therefore unhistoric. They betray a straining for effect, an ineffectual investigation of the true sources of history, and a disregard of their proper use, such as, if as true with regard to other States as of Rhode Island, will seriously impair, if it does not destroy, its value as history.

EDITOR OF BOOK NOTES.

PROVIDENCE, August 31.

Notes.

JAMES R. OSGOOD & Co.'s fall list of announcements includes the 'Life of Nathaniel Hawthorne,' by his son, Julian Hawthorne, in two volumes; 'John Greenleaf Whittier,' a biography, by Francis H Underwood; 'Eugène Fromentin, Painter and Writer,' translated from the French of Louis Gobse by Mrs. Mary G. Robbins; 'George Eliot; a Critical Study of her Life, Writings, and Philosophy,' by George Willis Cooke; 'Spiritual Creation, and the Necessary Implication of Nature in it,' by the late Henry James; Schopenhauer's 'The World as Will and Idea,' translated by R. B. Haldane and John Kemp; 'The Ideas of the Apostle Paul,' by the Rev. James Freeman Clarke; 'Myths of the Indians; or, Legends, Traditions, and Symbols of the Aborigines of America,' by Ellen Russell Emerson; 'Schools and Studies,' essays on educational topics, by President Hinsdale of Hiram College; 'The Course of Empire; being Outlines of the Chief Political Changes in the History of the World,' by Charles Gardner Wheeler; 'The People and Politics; or, The Structure of States and the Significance and Relation of Political Forms,' by G. W. Hosmer, M.D.; Palfrey's 'Compendious History of New England,' in four volumes, with a new and complete index; 'Woods and Lakes of Maine; or, A Trip from Moosehead Lake to New Brunswick in a Birch-bark Canoe,' by Lucius L. Hubbard; 'A Year of Sunshine,' cheerful extracts for every day, selected by Kate P. Sanborn; 'Nights with Uncle Remus,' by Joel Chandler Harris; 'A Little Girl among the Old Masters,' with introduction and comment by W. D. Howells; 'Red-letter Days Abroad,' by John L. Stoddard; 'Abelard and Heloïse,' by Mrs. Abby Sage Richardson; and 'The Recollections of a Drummer Boy,' by the Rev. Harry M. Keifer. Also, the following novels: 'Dolly,' by Frances Hodgson Burnett; 'Guenn: a Wave on the Breton Shore,' by Miss Blanche W. Howard; 'Fortune's Fool,' by Julian Hawthorne; 'A Woman's Reason,' by W. D. Howells; 'A Woman of Honor,' by H. C. Bunner; and 'The Storied Sea,' tales and essays by Mrs. Susan E. Wallace, wife of our Minister to Turkey. Finally, 'Songs of Fair Weather,' by Maurice Thompson; and a new illustrated edition of Tennyson's 'Princess,' uniform with the 'Lady of the Lake,' published last year.

The first two volumes in Houghton, Mifflin & Co.'s new edition of Emerson's works will be the old 'Miscellanies,' under the title of 'Nature, Addresses, and Lectures,' and the first series of 'Essays.' The former will contain a steel portrait by Schoff. The American Commonwealth series, edited by Mr. Horace E. Scudder, will begin with John Esten Cooke's 'Virginia,' and be followed by 'Maryland,' by William Hand Browne; 'Pennsylvania,' by Wayne McVeagh; 'Kentucky,' by Prof. N. S. Shaler; 'South Carolina,' by Wm. H. Trescot; and 'Oregon,' by the Rev. Wm. Barrows. Other announcements by this house are 'The Diplomatic History of the War for the Union,' by the late William H. Seward, edited by George E. Baker, and the 'Complete Works of William H. Seward,' with portraits and memoir, by the same editor; 'The Voyage of the *Jeannette*,' edited by Mrs. Emma De Long; 'The History of Prussia to the Accession of Frederic the Great,' by Prof. Herbert Tuttle, of Cornell University; 'The Works of Virgil,' translated into English verse, with notes and comparative readings, by John Augustine Wilstock; Carl Ploetz's 'Epitome of Ancient, Mediæval, and Modern History,' translated by Wm. H. Tillinghast, of the Harvard University Library; 'A Handbook of English Authors,' by Oscar Fay Adams; 'A Roundabout Journey,' by Chas. Dudley Warner; a Riverside edition of Shakspere, edited by Richard Grant White; 'The Works of Jonathan Swift,' in nineteen volumes, with notes and a life by Sir Walter Scott; 'The Bay of Seven Islands, and Other Poems,' by John G. Whittier; 'He and She: a Poet's Portfolio,' by W. W. Story; 'Poems for Children,' by Mrs. Celia Thaxter; 'Mercedes,' and Later Lyrics,' by Thomas Bailey Aldrich; 'Twenty Poems from Henry W. Longfellow, illustrated from paintings by his son, Ernest W. Longfellow; Longfellow's 'Michael Angelo,' illustrated by numerous American artists; 'Art Anatomy,' by Dr. Wm. Rimmer, a facsimile of the fifty plates, folio, which were destroyed in the Boston fire; 'An Ambitious Woman,' by Edgar Fawcett; 'Man a Creative First Cause,' by Rowland G. Hazard; 'Beyond the Gates,' by Elizabeth Stuart Phelps; and 'Characteristics,' by A. P. Russell.

Harper & Bros. publish immediately 'A Companion to the Greek Testament and the English Version,' by Dr. Philip Schaff, of which two of the appendixes possess a high value: "Appendix I. is the most comprehensive list of printed editions of the Greek New Testament ever printed. It was prepared by Prof. Isaac H. Hall, of Philadelphia, and comprises 923 editions, 251 of which have not been mentioned in any similar list that has hitherto appeared. Appendix II. is altogether unique, being a collection of carefully-made facsimiles (reduced in many cases) of titles and specimen pages from twenty epoch-making editions of the Greek Testament."

Cupples, Upham & Co., Boston, will bring out during the autumn 'The Pilgrim Republic: an Historical Review of the Colony of New Plymouth,' by John A. Goodwin; 'About Spain,' by W. H. Downes, illustrated; a 'Memoir of Charles Lowe,' by Martha P. Lowe; 'Stray Chords,' poems by Julia Anaguos, a daughter of Mrs. Julia Ward Howe; and 'Patrice: her Love and Labor,' by Edward F. Hayward. The same firm are the publishers of the elaborate and costly art catalogue of the New England Exposition, illustrated by 19 etchings, 12 albertypes, 32 drawings, etc.

David Bogue, 3 St. Martin's Place, Trafalgar Square, London, has in press 'Henry Irving, a Biographical Sketch,' by Austin Brereton, with fifteen full-page portraits by Whistler, Barnard, Mrs. Allingham, etc., in the actor's Shaksperian and melodramatic characters, and a drawing by Fred. Barnard of Miss Ellen Terry as "Portia."

J. B. Lippincott & Co. place upon the American market the 'Life of Sir Wm. Rowan Hamilton,' of which the first volume alone has appeared and has been noticed at length in these columns (*Nation*, No. 935).

W. R. Jenkins, 850 Sixth Avenue, has begun with Henry Gréville's 'Dosia' a series of 'Romans Choisis,' in the original French. We must again repeat our caution about the proof-reading. "Greville" on the cover, with "Gréville" on the title-page; "so" for "sa" on p. 206, are careless typographical errors, against which the price of these volumes, moderate as it is, should insure the purchaser.

Dr. Sternberg's book on 'Photo-micrographs and how to make them' (Boston: J. R. Osgood & Co.) is a handsome volume, profusely illustrated by the heliotype process, which will be found interesting by those who have some familiarity with the use of the microscope and would be glad to make pictorial memoranda of the interesting objects which occasionally appear on their slides. The importance of this means of recording transient appearances, such as a particular stage of development of a minute organism, is very great, especially in certain branches of biological investigation, and is not yet fully appreciated. No camera-lucida or diagrammatic drawing can be so convincing as a photo-micrograph in cases where the latter can be made with a reasonable amount of distinctness. No assertions by an enthusiastic microscopist that he has found "germs" in a certain fluid can be so convincing as a sun picture of those germs. The technique described by Dr. Sternberg is good so far as the photographic part of the process is concerned, but amateurs will find but scanty information as to histological methods of preparation, which are so important in tissue studies. The plates given, with their descriptions, come under the head of popular science, and the author's suggested title for this section (which makes about half the book), viz., "Elementary Lessons in Biology," is a very good one.

A second edition of Prof. Lewis Campbell's 'Theætetus of Plato' is one of the recent issues of the Clarendon Press. It is a large 8vo of 356 pages, with a very tempting make-up. The first edition of the book appeared in 1861, so that nearly a quarter of a century separates the two editions. In no quarter of a century since the revival of learning has the study of Plato been so widely extended or so ardently pursued. The same re-

mark would perhaps apply to several other Greek authors, and those who would eliminate Greek from among our educational studies may derive what comfort from it they can. Professor Campbell has availed himself of all the important results of these studies, and has made not a few contributions of his own. He has studied the elaborate introductions and analyses of Professor Jowett's translation of Plato's entire works, and Mr. Grote's stupendous work 'Socrates and his Friends,' with a care only exceeded by that with which he has studied Plato himself. Particularly interesting, even to those who, like ourselves, must dissent from a large portion of what they contain, are the two dissertations in which Professor Campbell discusses the famous principle of Protagoras—"Man is the measure of all things; things *are* to me as they *appear* to me, and are to you as they appear to you." They are fine examples of that metaphysical subtility for which Scottish professors are famous. It is greatly to be regretted and little to be excused that a book otherwise so excellent should not only lack an index of any sort, but should be devoid even of a table of contents.

Volume v. of Brockhaus's Conversations-Lexikon (L. W. Schmidt) ends with part 75, and the next part opens with the subject of Electricity, to which forty-two pages are devoted. Edison had already been treated biographically at respectful length, and with discrimination, for we read (p. 761): "Edison's success is to be ascribed rather to his tremendous capacity for work, acute natural perception, and extraordinary power of combination, which knows how to make the most of results obtained empirically, than to exceptional genius or to knowledge that rests on a firm scientific foundation." The other great articles are Precious Stones (*Edelstein*), Iron (*Eisen*), and Railroads (*Eisenbahn*). This last fills nearly forty pages, and abounds in valuable statistics. In a list, with dates and figures of killed and wounded, of twenty-seven memorable accidents, the United States occurs fourteen times. The *Railroad Gazette's* annual record of train accidents is availed of; and in the plate accompanying the article the American palace-car has its proper place. The maps relate to Germany and neighboring states — industries, and mountain and river systems.

The third part of Mr. Néstor Ponce de Leon's praiseworthy 'Diccinario Tecnológico' (English-Spanish) has now appeared, carrying the work on from Bond to Carriage. Part 4 is promised in November. The need of such a work is emphasized by the very incompleteness of it, now that it has been begun; but apparently another year must elapse before the first volume is completed.

'Vix,' a story reprinted from Col. George E. Waring's 'Whip and Spur,' introduces a series of 'Waring's Horse Stories,' published by J. R. Osgood & Co. The title promises an exciting, but this is really a pathetic tale.

A 'History of the New York State Teachers' Association' has been usefully compiled by Hyland C. Kirk (New York: E. L. Kellogg & Co.). It summarizes the annual conventions of this body, which was founded in 1845, and sketches at greater or less length the more prominent members. Portraits of not a few of these are interspersed with the text, and afford a curious study of professional physiognomy.

One might hesitate how to speak of the 'Tenting School' (Ringoes, N. J.: C. W. Larison), whether for its main purpose—"a description of the tours taken and the field-work done, by the class in geography in the Academy of Science and Art" at the above-named place—or for its subordinate aim "to improve the spelling of the English language as it is used in America." Many practical hints for a novel sort of educational picknicking (a summer school on wheels and under tents), with considerable information about central New Jersey and the adjoining coast, can be here obtained in a peculiar phonetic garb. There is also a rather clever school-girl sketch of a sail on Barnegat Bay. Add several rude maps and woodcuts. The work, if eccentric, and not what might be expected to emanate from an "academy of science and art," is earnest and wholesome.

The *Natural History Journal and School Reporter*, published in York, England, is primarily, though not exclusively, a medium of information for the Friends' Schools. In many ways it illustrates the difference between the English and the American branches of the denomination—not least in the department of athletics, where "records" have begun to be published, and we read in the June number: "The Kick at the Football would, no doubt, soon be beaten if all schools adopted it, and we hope they will next year." The *Journal* is a modest and useful worker in the vast field of science, and lends its aid to systematic observation such as that in regard to the phænology of plants, on which Drs. Hoffmann and Ihne are engaged. It is illustrated, and has even a chess department.

Science contains in its five issues, August 17 to September 14, a full report of the proceedings of the meeting of the American Association for the Advancement of Science at Minneapolis. The timeliness of Professor Rowland's address before the physics section, in which he enforces the responsibility that rests upon scientific men of distinguishing between great things and little things in science, is made strikingly apparent by the report of Section A. From this it appears that some elementary properties of squares, deduced from the "usual" binomial theorem with "almost obvious" simplicity, were received by the section with hearty applause.

A catalogue of works on Madagascar or in the Malagassy tongue is attempted in the August number of *Polybiblion*.

The significant papers published with the current Proceedings of the American Antiquarian Society are "Gleanings from the Sources of the History of the Second Parish, Worcester, Mass.," by Samuel S. Green (the historian Bancroft's father was pastor of this parish, dying in 1839 at the age of eighty-four); "The Journey of Moncacht-Apé," a Yazoo chief who preceded Lewis and Clark in the overland journey, by A. McF. Davis; and "Iron from the Ohio Mounds," by F. W. Putnam.

Perhaps nothing was more effectually shut out from the South by slavery than art, and the comparatively recent exhibition of pictures at Atlanta, and that of works of art in general now forming part of the Southern Exposition at Louisville, are important events in the growth of that section in cultivation. The catalogue of the Louisville collection fills eighty pages, and has been conscientiously compiled.

The failure of the Messrs. Harpers' prize competition for illustrations of Alfred Domett's 'Christmas Hymn' might have been expected on account of the inappropriateness of the subject. Prize poetry about the nightingale or the primrose would be nearly as promising. The offer has just been renewed to artists under twenty-eight, the subject being "Christmas" simply.

—The increased interest felt in everything relating to our forests and forest trees is shown by the numerous publications which have lately appeared upon these subjects. The latest of these to reach us is a catalogue of the forest trees of Arkansas, reprinted, with copious notes, from the *American Journal of Forestry*. It is from the pen of Prof. F. L. Harvey, whose investigations in connection with the census of 1880 have done so much to reveal the remarkable wealth and composition of the Arkansas forests. The field is an inviting one; there is hardly a spot outside the tropics where the forest exceeds that of southern Arkansas in beauty and variety. Professor Harvey includes 129 arborescent species in his catalogue, but the number should be slightly reduced by the omission of some half-dozen species admitted doubtfully or upon the insufficient authority of early travellers. The chestnut, for example, is now known to belong exclusively to the cis-Mississippi region; and at least the pines here admitted are not known west of Tennessee. The Arkansas sylva is characterized by its many species which, under less favorable conditions of soil and climate, hardly rise above the proportions of insignificant shrubs, but here and nowhere else become considerable trees; by the number and variety of the species of oak it contains; by the development and beauty of its hawthorns; and by the fact that seven species of hickory grow in one of its southern counties side by side, although not thus elsewhere associated. The number of coniferæ detected within the limits of the State is small, considering its extent and the variety of its soil and elevation. These local sylvas are valuable helps to a better knowledge of our trees, and there cannot be too many of them.

—An English medical journal calls attention to the danger of the communication of disease through books, especially of the entertaining class, which are likely to be read by persons suffering from catching diseases. It tells us that the organic particles that carry the infection may be as dangerous weeks or months after they found lodging in the unsuspected pages of the book as when they left the sick room. It is only necessary for a susceptible person to open the volume for the evil to be done. Measles, scarlet fever, diphtheria, sore throat, whooping-coughs, bronchitis, consumption, perhaps—any disease in which the lungs or the skin is giving out poisonous exhalations—may be transmitted more certainly and more widely by books than in any other way. It is a discouraging picture—a pendant to those which the *Lancet* paints from time to time, in which we see the thorough adulteration of everything which we eat. When combined with the chances of catching typhoid fever in the country during our vacations, and being poisoned by sewer-gas in the city during the winter, with the rapidly diminishing number of unpolluted water-supplies, with the gradual but certain filling up of the atmosphere by dust and smoke, it affords a ready answer to Mallock's question whether life is worth living, by showing that, to any well-informed person, life is becoming impossible. As to this newly-discovered danger, it will be advisable for cautious persons to read no book which is not accompanied by a medical certificate that it has never been read by any person having, or having had, an infectious or contagious disease. A surer way still will be to imitate the practice of the clubs in regard to fresh packs of cards, and never read a book after it has been read by any one else. In the meantime, it may be a comfort to timorous persons to know that in great public libraries whose books circulate without restriction everywhere, when the smallpox has been raging, it has never been communicated to the attendants by books, nor, so far as is known, to any of the other borrowers.

—The Parliamentary document (Hansard, 282) relating to the purchase of the Stowe collection from the Ashburnham MSS. possesses a high degree of interest. This collection forms but a fourth part of the whole, and was sold for £45,000, or a little more than one-fourth of the

price asked for it, the Barrois and Libri collections, and the so-called Appendix, together (£160,000). It numbers 996 volumes, and was manifestly the portion above all others which the Government, if compelled to make a choice, should have selected, for it is of high importance and rare curiosity for the history of the three kingdoms. The main body of the Irish MSS. (partly in the Irish language) are to be deposited as an indefinite loan with the Royal Irish Academy. They embrace sixteen volumes containing the redistribution of lands forfeited by the rebellion of 1641, and twenty-two volumes of the state papers and correspondence of the Earl of Essex during his viceroyalty. There are also ten volumes of Hanoverian state papers and abundance of pieces for the civil wars. The autograph letters of kings and statesmen are very numerous, from the time of Henry IV. down. No. 30 of the catalogue is "the original return concerning the levy of ship money, made to Sir Peter Temple, High Sheriff of Bucks, in 1635, from the parish of Great Kimble, a village at the foot of the Chiltern Hills, around which the principal property of John Hampden lay"; and Hampden's name heads the list. No. 29 includes three original letters of his. No. 33 is a pay-warrant signed by Cromwell, and by Thurloe and Milton among the receivers. The foreign royal autographs are also notable, but chiefly French. A letter of Franklin's, dated Passy, November 11, 1784, is mentioned. An early specimen of an indispensable modern convenience is a small quarto MS., entitled 'Alphabetical Book of Index, whereby several remarkable passages in Rapin's History of England to the Revolution may be easily turned to, continued to the end of King William's reign to another History,' by Charles Gibbon. Among other miscellaneous MSS. is a quarto vellum copy of Petrarch's 'Sonetti e Trionfi,' which might have been the poet's own last copy, being judged by its handwriting to be of the time of his death. Passing over the ample ecclesiastical sections, the collection is very strong in charters and cartularies, Anglo-Saxon, English, and Scotch. A lot of Oriental manuscripts close the catalogue.

—The Rev. F. E. Warren, already favorably known through his 'Liturgy and Ritual of the Celtic Church' (in connection with the edition of the Stowe Missal), has just published the 'Leofric Missal' (Oxford: Clarendon Press, pp. lxvi.-344). This missal, bequeathed by Leofric, first Bishop of Exeter, 1050–1072, remained for centuries in the Chapter library until, in 1602, it passed into the Bodleian. The editor has discussed very fully in his introduction the composition and general relations of the manuscript, showing that it consists of at least three independent elements, which he designates as A, B, and C. Part A (two-thirds of the whole) is a Gregorian Sacramentary, written in Lotharingia early in the tenth century, and probably brought with him by Leofric from the Continent to England. Part B is a calendar, prepared in England and for English use, in the latter part of the tenth century. Various indications (notably the names of saints and ecclesiastics commemorated) point to the monastery of Glastonbury as its place of composition. The contents of C are very miscellaneous, and can scarcely be assigned to any one place or time. "They comprise masses, manumissions of serfs, historical statements, etc., written in England partly in the tenth, partly in the eleventh centuries," and inserted rather irregularly into the text of A and B. The manumissions occur at three places, and are in Anglo-Saxon. They are interesting not only for their phraseology, but because they prove the custom of manumitting at the crossing of four roads. The significance of the 'Leofric Missal' in its entirety "lies in the fact that it is one of the only three surviving missals known to have been used in the English Church during the Anglo-Saxon period." The other two are the so-called 'Rede Boke of Darbye' (now in C.C.C.C. Library) and the missal of Robert of Jumièges, now at Rouen. Mr. Warren has not published the texts of these two, but has quoted enough of them to show wherein they differ from the Leofric. He has also collated in this manner a few other MSS. or fragments. The 'Leofric Missal' will be of value chiefly to the student of English liturgy, but Mr. Warren's remarks throw light on many points of English history. The indices at the end are models of fulness. That of the proper names appears to be perfect, giving even the variants of spelling. In view of the large number of English and Celtic saints and ecclesiastics commemorated, it will be of great help in the study of onomatology in England. But we must call the editor's attention to the recently adopted practice of treating *a* and *ae* as equivalents in Anglo-Saxon words; and we regret that he has not marked in his text the manuscript pagination, inasmuch as he refers continually to it in the introduction. Yet these are only slight blemishes; the book as it stands cannot be too warmly commended.

MADAME JUNOT'S MEMOIRS.

Napoleon: His Court and Family: Memoirs of Madame Junot, Duchesse d'Abrantès. London: Bentley & Son. 3 vols. 1883.

THE general interest awakened by the publication of the 'Memoirs' of Mme. de Rémusat has induced the publishers of the English translation of that fascinating book to issue a "new" and "carefully revised" edition of the 'Memoirs' of Mme. Junot, which deal with the same period of history. The "revision" has not been so "carefully" executed as could be desired. The translator's English is frequently clumsy enough, and, at all times, a sorry substitute for the vivacity of the original French; still, all deductions made, the reading public must be thankful to have again placed within their reach one of the most interesting books in existence.

Mme. Junot, whose maiden name was Permon, belonged to a family which had long resided in Corsica, and had there become intimate with the family of the Bonapartes. Her mother had known Napoleon, his brothers and sisters, from the days of their infancy till they grew into men and women; and Charles Bonaparte, the father, was carefully nursed by her through his last illness, and expired at her house in Montpellier—the Permons being at that time resident in France. An incident such as this could not but strengthen the intimacy between the two families; and Napoleon, a short time before setting out to take command of the French army in Italy, proposed that this intimacy should be cemented by no less than three marriages. The son, Albert Permon, was to be married to his sister Pauline—afterward the Princess Borghese; Mme. Junot, then a little girl, was to be married to his brother Jerome, also at that time little more than an infant; while Bonaparte himself proposed to marry Mme. Permon, the mother. It was in vain that Mme. Permon pointed out that she was more than old enough to be his mother—the future emperor professed his indifference to such a trifling matter as that of age. Mme. Permon did not look more than thirty, and that was sufficient for him. The lady, however, was too sensible to entertain this singular proposal. "She gave him her hand, and repeated, still laughing, that though she had some pretensions, they did not aspire so high as to conquer the heart of a man of twenty-six, and that she hoped their friendship would not be interrupted by this little affair. 'At any rate, think of it,' said Bonaparte. 'Well, well, I will think of it,' replied my mother, laughing as heartily as before." This was Napoleon's first attempt at match-making, in which occupation he became subsequently an unwearied laborer, and it was entirely unsuccessful, for none of these projected unions became accomplished facts.

Junot was one of the first of Napoleon's military comrades, and none among his marshals was more devoutly attached to their leader. Their intercourse dated from the siege of Toulon. Junot was at that time a simple sergeant of grenadiers. He had been educated for the bar; but when the allied Powers of Europe invaded France, he abandoned his peaceful profession and enlisted as a soldier. He soon established a reputation for headlong gallantry, and was known in his regiment as *la Tempête*.

"Being one day on duty at the battery of the Sans-Culottes, . . . Bonaparte asked for some one who could write a good hand. Junot stepped out of the ranks and offered his service. Bonaparte told him to place himself somewhere to write a letter which he would dictate. Junot chose the corner of the battery. Scarcely had he finished the letter when a bomb, fired by the English, burst at the distance of ten paces and covered him, as well as the letter, with mould. 'Capital!' said Junot laughing, 'we wanted some sand to dry the ink.' Bonaparte fixed his eyes on the young sergeant; he was quite calm, and had not even started. This circumstance decided his fortune."

He became aide-de-camp to General Bonaparte, was with him all through his Italian campaigns and the war in Egypt, and, upon Bonaparte becoming First Consul, was appointed military commandant of Paris. It was at this time that Junot became the husband of Mlle. Permon, then a girl of seventeen. Thus Mme. Junot, from her earliest years, was in a position specially favorable for the acquiring of a true insight into the character of Napoleon; and these memoirs are a proof that she did not fail to turn the opportunity to the best account. But they are not less entertaining as a picture of the manners of the time, and indeed it is from this picture that we learn how it was that Napoleon acquired so extraordinary an ascendancy over the minds and wills of his fellow-countrymen.

The dresses of the ladies at this period were truly amazing in their eccentricity and their extreme costliness. The following is Mme. Junot's description of Pauline, Napoleon's beautiful sister—who, subsequently, sat as a model to the sculptor Canova, clothed (as a Hindoo philosopher would delicately put it) "with the regions of space"—as she appeared at one of Mme. Permon's balls:

"Mme. Leclerc informed us that she had prepared for the occasion a dress which, to use her own expression, she expected would *immortalize her*. This dress was a subject of the most serious consideration with her at least a week before she was destined to wear it, and she enjoined the strictest secrecy on Mme. Germon (the dressmaker) and Charbonnier (the hairdresser). She requested permission to dress at our house, which she frequently did in order that she might enter the ball-room with her dress completely fresh and in all its beauty Only those who knew Mme. Leclerc at that time can form any idea of the impression she produced on entering my mother's drawing room. The head-dress consisted of *bandelettes* of a very soft fine kind of fur, of a tiger pattern. These *bandelettes* were surmounted by bunches of grapes in gold; but the hair was not dressed so high as it is now worn. She was a faithful copy of a Bacchante, such as are seen in antique statues and cameos. . . . Her robe of exquisitely fine India muslin had a deep bordering of gold; the pattern was of grapes and vine leaves. With this she wore a tunic of the purest Greek form, with a bordering similar to her dress, which displayed her fine figure to admirable advantage. This tunic was confined on the shoulders by cameos of great value. The sleeves, which were very short,

were lightly gathered on small bands, which were also fastened by cameos. Her girdle, which was placed below the bosom, as is seen in Greek statues, consisted of a gold band, the clasp of which was a superbly-cut antique stone. She entered the drawing-room without her gloves, displaying her beautiful white round arms, which were adorned with bracelets formed of gold and cameos. It is impossible to describe the effect her appearance produced. Her entrance seemed absolutely to illuminate the room."

Very interesting, in these Memoirs, are the notices of Napoleon as he was before his great career had begun to open before him. Here is one concerning him, just after he became a sub-lieutenant of artillery:

"Previously to his departure he came to pass some time at our house. My sister was then at her convent, but she frequently came home while Napoleon was with us. I well recollect that on the day when he first put on his uniform he was as vain as young men usually are on such an occasion. There was one part of his dress which had a very droll appearance—that was his boots. They were so high and wide that his little thin legs seemed buried in their amplitude. Young people are always ready to observe anything ridiculous, and as soon as my sister and I saw Napoleon enter the drawing-room we burst into a loud fit of laughter. At that early age, as well as in after life, Bonaparte could not relish a joke; and when he found himself the object of merriment he grew angry. My sister, who was some years older than I, told him that since he wore a sword he ought to be gallant to ladies, and, instead of being angry, should be happy that they joked with him. 'You are nothing but a child, a little *pensionnaire*,' said Napoleon in a tone of contempt. Cécile, who was twelve or thirteen years of age, was highly indignant at being called a child, and she hastily resented the affront by replying to Bonaparte, 'And you are nothing but a *puss in boots*.' This excited a general laugh among all present except Napoleon, whose rage I will not attempt to describe."

Such was the opening scene in the military life of Napoleon. The conqueror of Austerlitz and Jena was assured by a vivacious young lady that he was only "a puss in boots."

It was subsequent to his distinguished services during the siege of Toulon, that Napoleon was arrested and thrown into prison. He was put upon his trial, and, although acquitted, his enemies were sufficiently powerful to cause his name to be erased from the list of French generals. For some years he remained in an extremely hopeless and poverty-stricken condition, and but for the generous attachment of Junot could not have found means of subsistence. During this period of depression, Bonaparte was a frequent visitor at the house of Mme. Permon; and, though he spoke French execrably, Mme. Junot remembers how the vigor and originality of his conversation enchained the attention of all who heard him. At this period of his life, Mme. Junot informs us, Bonaparte was "decidedly ugly," and a considerable sloven to boot. Subsequently, she admits, his appearance underwent a complete change; but then his features were sharp and angular, he wore a shabby round hat drawn over his forehead, gloves he rejected altogether as a useless and expensive luxury; and he wore boots ill-made and ill-blackened, which he was in the habit of drying in front of Mme. Permon's fire, to the extreme dissatisfaction of that lady. "He at length perceived this, and, being at that time exceedingly afraid of displeasing my mother, he would prevail upon our maid to brush his boots before he came in." From this condition of depression Napoleon was liberated by the events of the 13th Vendémaire, year 4 of the Republic. It was then that he quelled "the sacred right of insurrection," embodied for the moment in the Section Lepelletier, and, according to Carlyle, "blew into space the thing we specifically call the *French Revolution*."

"After the 13th Vendémaire (4th October)," writes Mme. Junot, "soiled boots were out of the question. Bonaparte never went out but in a handsome carriage, and he lived in a very respectable house, Rue des Capucines. In short, he had become an important, a necessary personage; and all without noise, as if by magic. He came every day to see us, with the same kindness and the same familiarity. . . . At this period famine prevailed in Paris in a greater degree than anywhere else; there was a real want of bread; and other kinds of provisions ceased to find their way to the city. The distress was dreadful. . . . Bonaparte saved more than 100 families from perishing. He caused wood and bread to be distributed among them at their own homes; this his situation enabled him to do. I have been charged by him to give these bounties to more than ten unfortunate families who were starving. . . . One day, when Bonaparte came to dine with my mother, he was stopped in alighting from his carriage by a woman who held a dead infant in her arms. It was the youngest of her six children. Her husband, a slater by trade, had been accidentally killed three months before, while at work on the roof of the Tuileries. Nearly two months' wages were due to him. His widow could not obtain payment. She suckled, but grief and afterward want dried up her milk. Her poor little infant had just expired; it was not yet cold. She saw a man, whose dress was covered with gold, alight at our own door almost every day, and came to ask him for bread, 'that the other children might not share the fate of the youngest,' she said; 'and if nobody will give me anything, I must even take them all five and drown myself with them.' . . . Bonaparte, that day, came into my mother's with a look of sadness, which he retained all dinner-time. He had, for the moment, given a few assignats to the unhappy woman. After we had all left the table, he begged my mother to cause some inquiry to be made concerning her. I undertook the office. All she said was true, and, moreover, this poor mother was an honest and virtuous woman. Bonaparte, in the first place, obtained payment of the arrears due to her husband, and a little pension was afterward granted to her. Her name was Marianne Huvé. She lived for a long time near our house. She had four girls whom she brought up like a good mother. Two of them frequently came to do needlework for us; they always expressed the most profound gratitude to the *General*, as they called him."

The foregoing is one out of several like stories related in these Memoirs which show that until warped and hardened by power and ambition, the nature of Napoleon was not lacking in humane and compassionate elements.

Mme. Junot's testimony to the striking force and brilliancy of Napoleon's conversation at this period is in exact accord with that of Mme. de Rémusat:

"Our evenings, even after the play if it were not too late, were spent at Mme. Bonaparte's. There we enjoyed the happiness of meeting the First Consul. His conversation, always attractive by its depth of thought, and that air of originality which reflected from his rich and brilliant imagination, acquired increased interest from the consciousness that at such a moment he could give expression only to ideas of the most direct influence. For this reason I seldom missed the quintidian dinners. . . . The most profound civilians, the ablest financiers, the most subtle diplomatists thronged around to hear him, and appeared to be rather taking lessons from him than imparting their knowledge to a young man, whose pale complexion bore witness to watchings and fatigues far exceeding theirs, although the superiority of years was greatly on their side."

At this time Bonaparte, although First Consul, and the most powerful man in France, had not thought fit to surround himself with an inaccessible etiquette. He occupied the Tuileries, but simply as the first citizen of France; and the intercourse between him, his generals, and their wives was free and unconstrained. Every fortnight a parade of troops was held in the court of the Tuileries. All the regiments in France came up to Paris in due succession to be present at these reviews. They lasted for several hours, because Napoleon made use of them to converse with all the subaltern officers, and even the private soldiers. His care extended to the most minute particulars—the food, the dress—everything that was necessary to the efficiency and well-being of the men. He encouraged them to speak to him without restraint. "Conceal from me none of your wants," he would say; "suppress no complaints you may have to make of your superiors. I am here to do justice to all, and the weaker are especially entitled to my protection." Mme. Junot records the following incident at one of these reviews, which is illustrative of the manner in which Napoleon established his ascendancy in the hearts of his soldiers:

"At this moment the First Consul stopped under our window, and said to a drummer of about sixteen or seventeen, 'So it was you, my brave boy, who beat the charge before Zurich.' The countenance of the young soldier was suffused with crimson, but it was not timidity which called the flush to his cheek. He raised toward the First Consul his large black eyes, sparkling with joy at being thus publicly distinguished, and replied in a half tremulous, half confident tone, 'Oui, mon Général.' 'It was you, too, who at Weser gave proof of the most gallant presence of mind by saving your commander.' The youth blushed still deeper, this time from modesty, and answered in a lower voice than before: 'Oui, mon Général.' 'Well, I must discharge the debt of the country; it will be paid you not in a ring of honor, but a sabre of honor; I appoint you a subaltern in the Consular Guard. Continue to behave well, and I will take care of you.' As the First Consul ceased speaking, he raised his eyes to the low window at which we were seated, and, touching his hat, saluted us all with a gracious smile. My mother-in-law's eyes filled with tears. 'How ought we to love this man!' said she, crying and laughing together. 'See how the poor boy is overpowered!' The young drummer was leaning on the shoulder of a comrade, and following Bonaparte with his eyes. He was pale as death, but how eloquent were his looks! I know not what may have become of him; but I will answer for it, if his life were sacrificed for Napoleon, it cost him no regret. He was in the evening the subject of my conversation with the First Consul; he listened with interest, and, addressing Berthier, . . . desired him to take down the young man's name, and provide him with outfit for his new rank."

Here our gleanings from this fascinating book must come to an end. It is unsystematic, but there is an epical completeness in the career and destiny of Napoleon, which gives an involuntary unity to any work that deals with it as a whole. There is, first, the dark and agitated period of the Revolutionary struggle, then the calm and quiet hopefulness of the Consulate; then again the gaudy and oppressive splendor of the Empire, standing forth, as it were, from a background of thunder-cloud and gathering gloom; and, finally, the closing period of retribution and ruin. Mme. Junot lived through them all, and describes them with dramatic power and insight, fortified by personal knowledge of the great actors in the changeful drama.

FREEMAN'S ENGLISH TOWNS.

English Towns and Districts; a Series of Addresses and Sketches. By Edward A. Freeman, M.A. With illustrations and map. London and New York: Macmillan & Co. 1883.

THIS collection contains papers of two kinds: short sketches, reprinted from the *Saturday Review*, of the same character as the author's 'Historical and Architectural Sketches, chiefly Italian,' and his 'Sketches from the Subject and Neighbor-Lands of Venice,' and longer ones, resembling those on cities and countries in the third series of his 'Historical Essays,' and originally composed and published as addresses to various societies, several of them as presidential opening addresses to the Historical Section of the Archæological Institute. In both kinds of papers the author has, "in revising them for the reprint, made any changes that seemed to be called for, whether by adding, leaving out, or any other form of improvement." The illustrations are in the same style and made by the same artists as those in the 'Subject and Neigh-

bor-Lands of Venice.' The essays—thirty-one in number, grouped not in the chronological order of composition, but according to geographical divisions—are mainly devoted to the pointing out of historical and architectural features, not to detailed description, antiquarian or other. Each town is looked on and presented as a whole, with a kind of personal history, and put in its fitting place, as part of the history of England. "The city itself and its history are something greater than any particular object in the city."

A quarter of a century lies between the composition of the oldest and that of the latest of these sketches, but they are all—probably owing in part to the thorough revision, with its various "forms of improvement"—almost equally marked by the intense peculiarities of Mr. Freeman's historical and antiquarian pen. There is constant dissection, analysis, definition of terms, marking of limits, illustration by analogy, elucidation by contrast, presentation of likeness and unlikeness, repetition for the sake of clearness or inculcation—much beautiful work, some that is tedious; here flashes of genius, there almost pedantic hair-splitting; a vast display of knowledge and research, and some of prejudice and conceit. That the book is another rich contribution of the author to English history—though offering only strings of bits of information, and nothing complete in itself—need hardly be said at this stage of Mr. Freeman's fame; nor, on the other hand, that the same knowledge and acumen, with less mannerism, might have made it incomparably more charming.

In "Cardiff and Glamorgan," the first sketch, the historian asks himself these questions: Who were the first inhabitants of the country?

"Were the Britons the earliest wave of Aryan migration in these lands, or were they preceded by an earlier Aryan and Celtic race—that, namely, which consists of the Scots, both of Britain and Ireland? . . . That is to say, is the wide distinction between the two branches of the Celtic race in these islands, between the Scots or Gael, and the Welsh or Britons, a distinction which arose in these islands, or do they represent two successive waves of Aryan migration? . . . And, again, can either branch of the Celtic race, Gael or Britain, claim to be the first inhabitants of the land? Were the Celts preceded by races kindred to the primitive non-Aryan dwellers in Europe, of whom the Finns of the North and the Basques of the Pyrenees are remnants? Were the Silurians, whose descendants form a main element of the population in South Wales and the neighboring districts, a people closely akin to the non-Aryan Iberians of Spain, as 'has been held by two writers, both of great name, but with a long interval of ages between them—by Tacitus and by Professor Huxley'?"

Mr. Freeman, unlike other recent authorities (see "Celtic Britain," in the *Nation* of July 19) leaves the questions unanswered, remarking only in regard to the latter points: "I know not whether Britons will be ready to give up Caradoc as a British brother; I should certainly be unwilling to give him up as an Aryan cousin. . . . One thing is plain, that if the people of South Wales are really of a non-Aryan stock, the process of Aryan assimilation has been very thoroughly carried out." The British tongue is still living in these parts; if Basque or any other non-Aryan speech ever lived here, it long ago became extinct in vale and mountain. That it should have become extinct through assimilation must appear to Mr. Freeman very improbable, as he remarks in another essay, "Anglia Transwalliana": "English has not assimilated, though it has largely displaced, the Welsh and Gaelic tongues, with which it has no connection beyond the remotest Aryan kindred," while "the tongues of the Dane and the Fleming, as well as those of the Angle and the Saxon, have all been drawn together by the attraction of a single type of standard English"—which teaches us the lesson, "how easily a standard form of any language assimilates all the kindred dialects of a country, but how little effect it has on dialects which are not kindred."

What the type of standard English was that attracted and absorbed all other dialects Mr. Freeman tells us in his very elaborate paper on Lincoln ("Lindum Colonia," "an heathen" city on "an hill"): "The tongue which we call English, while it is neither the Northumbrian of York nor the Saxon of Winchester, is the intermediate Anglian speech of Eastern Mercia. . . . It was a Lincolnshire man, a Bourne man, who gave the English language its present shape. . . . We do not speak the tongue of Ælfred; we do not speak the tongue of Waltheof; but we do speak the tongue of Hereward, the tongue in which the chronicler of Peterborough kept on our native annals, till the pen dropped from his hand as he set down the coming . . . of the King who wore his crown in Coleswegen's church of Wigford." The birth of English learning, however, is traced further back in time, and further north, in "Points in Early Northumbrian History," one of the most interesting, if not the most interesting, of the thirty-one essays of the collection:

"Do not forget that the English tongue, that the earliest compositions in the English tongue, are more ancient than the migration which brought Englishmen to the shores of Britain. The first poets of the English race belonged, not to this our island England, but to the older England on the mainland. Had their tongue been Greek instead of English, their fame would have sounded from one end of heaven to the other. But the poets of our Homeric epic and of our Homeric catalogue, the gleemen who sang the tale of Beowulf and the song of the Traveller, being English, are nameless. But of the first Christian English minstrelsy, of the first recorded English minstrelsy on British ground, the land of Northumberland, the land of Deira, is the parent. Yours [Northumbria's] is Cædmon, the bard of the Creation, the bard of the battles of the patriarchs—he who, a thousand years before Milton wrote, had forestalled Milton, alike in his daring subject and in his majestic treatment."

Here—as often elsewhere—we have Mr. Freeman with all his passionate, almost superstitious, sympathy for everybody and everything in the remote past that promoted the rise, the "making," and "welding," the greatness and literary bloom of England, of English England. He never forgets to teach his hearers or readers to see a blessing in every event, however horrible and shocking, which tended directly or indirectly to "make England England." He graphically describes, under "Exeter," the heroic but vain resistance of that city to the Norman Conqueror, and immediately adds: "But we see none the less that it was for the good of England that Exeter should fall. A question was there decided greater than the question whether England should be ruled by Harold, Eadgar, or William, the question whether England should be one." Northumberland's resistance was equally stout and vain, but "the Norman conquest was, in very truth, a Saxon conquest. It ruled that England should be forever an united kingdom." Going further back, we find Silchester—of whose greatness in Roman times, as attested by recently dug-up remains, we read a wonderful tale—ruthlessly swept away by the conquering English; but mourn not: "It is because Silchester and places like Silchester were left waste without inhabitants—because those who dwelt in them were cut off by the sword or driven to save their lives in remote corners of Britain or Gaul—because for a hundred years the faith of Christ was wiped out before the faith of Woden—it is because of all this that Britain has not been as Gaul and Spain, and that we still keep the laws and the tongue which we brought from the mouths of the Elbe and the Eider." "Had it been otherwise," we are told under "Carisbrooke," "had the slaughter and havoc by our fathers been less complete, Englishmen would not have remained Englishmen, and Britain would never have become England." The following is, perhaps, the best specimen of the brutal pitch to which Mr. Freeman carries his philosophy of history:

"We were the Turks, and worse than the Turks, of those days; the sword was our only argument; the persecuted Briton had not even the chance of Koran or tribute. But simply because we carried slaughter and havoc to a more fearful pitch than any Turk ever carried them, for that very reason our conquest carried with it the hopes of better things. We stood on the ground which we made without inhabitants, to grow up, not as a mere conquering caste, but as a new people of the land. We stood ready to receive a new faith and a higher civilization, . . . from the Roman and the Scot. . . . We may weep for the monks of Bangor, but the day of their massacre was none the less one of the great days in the growth of the English nation. . . . Deva was the last city which was taken only to be left desolate. When Æthelfrith slew the British monks, part of England was already Christian. . . . And before that same seventh century had passed, Northumberland had become . . . the special home of learning and holiness, the cradle of the history of our people, the cradle of the poetry of our tongue."

Of course our historian does not mean to say that the English exterminators of the Christian Britons acted righteously in their heathen blindness and barbarous ignorance of historic pragmatism; he only delights in the strength and irresistibleness of the English sword and will. Thus speaks the historian of England. Freeman, the antiquarian and student of towers, gates, and steeples, bows before the same "ruling" of history. He cannot compare Exeter, the English city, as an architectural conglomeration of historical interest, with any of the Continental towns of a class even one degree lower than Venice or Florence, Treves or Ravenna. England has few spots so rich at once in history and art as to rival "the last home of Carolingian kingship on the rock of Laon" or the walls of successive ages—"spreading each round another, like the circles of Ecbatana"—which envelop the minster and the castles of Le Mans; "the Bern of Theodoric by the Adige" or "the Bern of Berchthold by the Aar"; the council-house of Lübeck or Ghent, of Padua or Piacenza; the episcopal palace of Liége or the ducal palace of Dijon; the castled steep of Marburg or the hill of Marburg, with its many-towered church, walls, and gateways. "Yet we need not grieve," he patriotically tells his fellow-patriots, "that we are in this matter poorer than other nations. . . . Why is the history of Nürnberg greater than the history of Exeter? Simply because the history of England is greater than the history of Germany. Why have not our cities such mighty senate-houses, such gorgeous palaces, as the seats of republican freedom or of princely rule among the Italian and Teutonic cities? It is because England was one, while Italy and Germany and Gaul were still divided." England's nobles and prelates were not allowed to grow into sovereign princes, nor her cities and boroughs to grow into sovereign commonwealths. In observations like these the antiquarian Freeman—to whom we are unable to do full justice—again merges in the historian. The following extract from "The Shire and the Gá"—another highly interesting essay—may, while concluding our inadequate analysis of this rich collection, serve to remind our reader of the geographer Freeman:

"It is the central position of Northampton and Northamptonshire which caused so many important scenes of national history to be acted within or under the walls of the town. The central land of England, the land into which not

a brook flows from any other shire, but out of which rivers flow into three seas, swelling the waters of the Wash, the Thames, and our own Severn Sea, was, from its mere place in the map, likely to be the scene of great events. A national assembly must be held somewhere. In days when there is free choice in such matters, when all the business of three kingdoms is not done in a single town, in a corner of one of them, that national assembly is most naturally held in some place near the centre of the kingdom. So, when armies are in the field, they will meet in battle somewhere; and when two armies of Englishmen are engaged in civil war, they are more likely to meet for their decisive struggle in Northamptonshire than in Northumberland or in Cornwall. But mark that the exact place depends upon the accidents of warfare. If one army had been a little quicker or another a little slower, the battle of Edgehill might have been fought in Northamptonshire or Oxfordshire, and the battle of Naseby might have been fought in Leicestershire. . . ."

CHARLES AND MARY LAMB.

Mary Lamb. By Anne Gilchrist. [Famous Women Series.] Boston: Roberts Bros.

The Essays of Elia. With Introduction and Notes by Alfred Ainger. London and New York: Macmillan & Co. 1883.

MARY LAMB, like Dorothy Wordsworth, was a woman for whom those who have known and loved her would have sought a tenderer word of praise than "famous." Barring this objection to the classification, the present book about her is welcome, not so much as adding to our knowledge of the Lambs as awakening a fresh interest by the novel grouping of even well-known incidents around Mary as the centre of the tale. This has been so ably done that no one, however well acquainted with the brother and sister, will fail to be grateful for it, while to younger readers it offers a nearly unparalleled example of the power of the most simple, the most unpretending of womanly natures to attract others to itself. Oddly enough, the one piece of hitherto unpublished, or rather unrepublished, writing—and that, too, the only one ever intended for mature readers—which the author has been able to discover, is a letter, after the manner of the *Spectator*, to the editor of the *Lady's Magazine*, "On Needlework." It has an historical value now which the modest author never anticipated for it, since it sets forth most clearly the views and hopes of a thoughtful woman of seventy years ago (the date is 1811). More than this, it incidentally covers the whole ground of the discussion about woman's position, the aims of her education, her work, and her wages, as we are now familiar with it. Such was her clear-eyed apprehension of the principles involved, that it needs but slight adjustment to present circumstances to be just as true and just as useful as upon the day when it was written.

Charles Lamb stands by common consent at the head of modern English humorists. Like so many of his successors and descendants, he was originally a journalist, or rather what might now be called "an outside paragrapher." He furnished jokes to editors at so much a piece, and his best-remembered essays were written for the press. From this modest, humble, and unrecognized position he has gradually risen to that of a classic, whose fame places him almost above criticism. Analysis and appreciation are the utmost that Mr. Ainger has attempted. He has left unsolved what is evidently to his own mind a rather interesting literary question, how far Lamb's fame rests upon a permanent basis, and how far his "self-pleasing quaintness" of style is likely in the long run to impair it.

The affectations which he employed in aid of his humor are not at all in the taste of our day, and seem to have exposed him to criticism in his own. His wide reading in English literature and strong mimetic faculty enabled him to reproduce the trick of style or expression of any writer or period, from that of the Shaksperian drama down to his own time; and his taste for squeezing the last drop of expression out of language led him to introduce a fantastic variety of style which overlaid, and often even obliterated, his own. His own individual style, unadorned and unperverted, may be found in far greater purity in the "Popular Fallacies," now so seldom referred to, than in the essays; and these are in many respects as funny as anything Lamb ever wrote. They are all of some permanent value, for they neatly unmask or correct the error which lurks beneath the surface of a proverb; and they are all amusing, from the fact that they gravely meet and dispose of the assertion contained in the saying in such a way as to make it seem for the time the exact opposite of the truth. Lamb gives the reader the idea that the statement that "Home is home, be it never so homely," or that "Enough is as good as a feast," is a monstrous lie, an invention designed to humbug mankind into contentment with unsatisfied desires and a despicable and squalid lot.

Mr. Ainger, whose name is familiar to all lovers of Lamb from the excellent biography contained in the "English Men of Letters Series," and also through an edition of the 'Tales from Shakespeare,' insists that Lamb's imitations of the styles of Sir Thomas Browne, Fuller, and others were natural to *him*, and, therefore, not fairly to be set down as affectations. This is perfectly true, as Lamb himself amusingly says: "They had not been *his* [mine]," had they not been "villainously pranked in an affected array of antique words and phrases." He fell into the style of familiar authors as their styles seemed to suit his subject, as any writer endowed with more literary sensibility than force is apt to do. This, however, does not affect the fact that these antique words and phrases now strike the ear as artificial, and not always as heightening the effect of the humor. It is hard, however, to lay down any general rules as to the laws which govern expression in humor.

The great and perennial charm of the 'Essays' lies in the fact that the humor in them is suffused with poetry and fancy and pathos of an exquisitely delicate and refined sort. From the wild extravagance and rollicking gravity of the "Roast Pig" essay to the delicate and touching sentiment of "Dream Children," there is a range not covered by any other humorist of modern times. The gentleness that everybody finds in Lamb is a gentleness closely allied to sadness of that unselfish sort of which we know his life was full. There are in every generation a few men whose sensitiveness of mind and heart fits them perfectly for reproducing all the fleeting and delicate contrasts with which life is full, and they are necessarily humorists, if not poets. It is not surprising to make out pretty clearly from Mr. Ainger's pages that Lamb's reputation as a critic is on the wane. His dictum as to the impossibility of acting Shakspere's plays is now seen to be a paradox—something like one of his own popular fallacies; his theory that the comedy of the Restoration must be considered the comedy of a world to which the ordinary distinctions between vice and virtue did not apply, can hardly now be considered very fruitful or exact. His opinion of the merit of his contemporaries, Byron, for instance, and Scott, appears to have been determined by accident. We know more about literature nowadays than he did, and hardly any longer look up to him as a literary authority; indeed, to us he is almost rather a friend than a literary man. We know so much of his life, of his modesty, his self-sacrifice, his goodness, his devotion to his sister, his struggle with adversity—he has so taken the world at large into his confidence, that friendship or affection is as much the result of reading him as admiration or amusement.

Mr. Ainger's notes are admirable; they fill nearly fifty pages, and contain a mass of interesting information about Lamb and his writings and his friends. Bibliographical details are given as to the first publication of the 'Essays' in magazines here and there. Many obscurities and allusions are explained, and many of Lamb's mystifications are unveiled. Mr. Ainger has had the use of a key (in Lamb's handwriting) to the various persons designated in the first series of essays either by initials or asterisks; this valuable paper is owned by Mr. Alexander Ireland. On pages 402 and 415 Mr. Ainger gives us two notelets of Lamb's hitherto unprinted. It is greatly to be wished that he, or some other editor as competent and as conscientious, might be induced to give us a full edition of Lamb's correspondence. There are a mass of uncollected letters, some to John Howard Payne (printed in the *Century* not long ago), some in Mr. C. Kegan Paul's life of Godwin, and many others scattered right and left in the catalogues of booksellers and dealers in autographs.

Physiological Cruelty; or, Fact *v.* Fancy: An Enquiry into the Vivisection Question. By Philanthropos. John Wiley & Sons. 1883. Pp. 156, 8vo.

As stated in the Preface, the author's aim "has been to place in the hands both of professional and unprofessional readers a short compendium of the principal established facts and most obvious reasonings on the question of experiment upon living animals." In the body of the work are candidly and ably discussed the following matters: What is Pain?—What is Cruelty?—Our Rights over Animals—What is Vivisection?—The Relation of Experiment to Physiology—The Relation of Medicine to Experiment—Legislation, Past, Present, and Possible. Each chapter closes with a brief summary, and the appendix presents in condensed form and logical order detailed evidence respecting Popular Fallacies about Experiment, Its Necessity, and English Laws concerning it. The book was printed (and presumably, also, first published) in England. The author is evidently an Englishman, apparently a physician, not obviously himself an actual experimenter, and certainly predisposed in the direction of real humanity to all living creatures; but his pseudonym indicates his view that if any suffering is needed, it should be inflicted upon animals rather than upon men; and his statements and opinions deserve careful attention in this country likewise, where certain "right-hearted," but "wrong-headed," persons are seeking to interdict by law the experimental advancement and dissemination of physiological knowledge.

After clear definitions of the words *pain* and *cruelty*, and a passing comment upon the misleading etymology of the term *vivisection*, the author gives reasons for the belief that even the higher animals are both physically and psychically less capable of suffering than human beings, and then states that, whatever may have been or may be the case upon the Continent, in England really painful experiments have never been sufficiently numerous or severe to require legal interference. This was practically conceded by the Royal Commission of 1875. Unlike the sensational writers who denominate all neuro-muscular reactions "spasms of agony," our author is not only possessed of the essential facts, but displays equal command of his temper and of the English language. Indeed, many of his expressions have the rare flavor, imparted by brevity and accuracy commingled, which is

so characteristic of the writings of Professor Huxley, and we wish there were space for quoting some of them. We must be content, however, with commending the work to all who sincerely wish for enlightenment on the subject, as the most complete and convincing presentation that has yet appeared of the views of the "moderate experimenters," of those who hold that, although vivisection may be, and doubtless has been, abused, it should, nevertheless, be used. Perhaps the only serious omission is in regard to the desirability of employing experiments—painless, of course—in illustration of all, even the most elementary, physiological teaching, just as in the study of chemistry and physics; but perhaps it could not be expected that this should be strongly urged in a land where "any one may torture wild creatures in whatever fashion he likes, *provided it be not for scientific purposes*," and where the teachers and investigators of physiology are "sentenced to be under the surveillance of the police for life."

In the concluding chapter, after exonerating English physicians and physiologists from the charge of "brutalizing" themselves and others by experiments, the author points out that the real danger of "demoralization" comes from the fact that "indiscriminate attack leads to indiscriminate defence." In their common resistance to the demands of ignorant or sentimental agitators, the naturally humane are thrown into undesirably close association with those who may be cruel by birth or through lack of proper training. It is, perhaps, an equally unfortunate result of the efforts to prohibit painless as well as painful experimentation, that in both England and the United States many teachers and physicians have been deterred from coöperation with societies for the prevention of cruelty to animals, the general objects of which they nevertheless cordially approve, and could very efficiently aid in accomplishing.

Historical and Biographical Sketches. By Samuel W. Pennypacker. Philadelphia: Robert A. Tripple. 1883. 8vo, pp. 416.

RATHER more than half of Mr. Pennypacker's volume is made up of papers, seven in number, upon the Mennonites of Pennsylvania. They are the result of many years' study and accumulation of materials with a view to writing a history of this body. The plan has been unfortunately frustrated, or, as we may hope, only delayed: it is very much to be desired that the history of so interesting and influential a community should be written by so competent a person. Most of these papers have already appeared in periodicals, that upon David Rittenhouse, the most distinguished member of the body, having appeared in *Harper's Monthly*. The name and achievements of Rittenhouse are generally familiar; the reader of this volume will be glad to make the acquaintance of other persons of Mennonite descent, less known, but well worthy to be known. The paper, for instance, entitled "Christopher Dock," describes the life and methods of a "pious schoolmaster," a short treatise by whom, upon "School Management," is translated and given in full (p. 98). Mr. Pennypacker takes pleasure in pointing out a general similarity in character and object in the Mennonite emigration to that of the New England Puritans, and it is a pardonable exaggeration if he is disposed to place his countrymen higher than they deserve, in proportion as they have been overlooked by historians. Certainly they merit much fuller recognition than they have received. *Carent vate sacro:* the poets and historians of America belong to other States and nationalities, and the "Pennsylvania Dutch" have been contemptuously overlooked. Whittier alone, in verses part of which are quoted in this volume, has sung of these German pilgrims—perhaps from a special sense of spiritual nearness; for the Quakers, like the Mennonites, appear to have sprung from the Anabaptist movement of the sixteenth century—not, however, that which had its seat at Münster. One of the most interesting facts brought out in this volume is the protest against African slavery, April 18, 1688—"the first public protest ever made upon this continent against the holding of slaves" (p. 42), here given in full. It is shown also (p. 10) that the first paper-mill in the colonies was that of Willem Rittinghuysen on a branch of Wissahickon Creek; and that the Bible was printed at Germantown by Christopher Saur thirty-nine years before any Bible in English. In these papers frequent credit is given to the valuable labors of Dr. Oswald Seidensticker.

The last half of the volume is taken up for the most part with short historical papers, several of them of permanent value. Nearly 100 pages are occupied with some personal reminiscences of the late war, entitled "Six Weeks in Uniform," the time being that of the battle of Gettysburg. There are also some occasional addresses, of which the short ones upon President Garfield and Henry Armitt Brown are marred by exaggeration of statement and of rhetoric.

BOOKS OF THE WEEK.

Allen, G. G. Universal Phonography; or, Shorthand by the Allen Method. C. T. Dillingham. 50 cents.
Bardeen, C. W. Verbal Pitfalls: a Manual of 1,500 Words Commonly Misused. Syracuse, N. Y.: C. W. Bardeen. 75 cents.
Bishop, C. E. Pictures from English History. By the Great Historical Artists. Phillips & Hunt. $1 25.
Bowen, Dr. H. The Overshadowing Power of God: a Synopsis of a New Philosophy concerning the Nature of the Soul, etc. Cold Spring, N. Y.: New Life Publishing Co.
Brockhaus's Conversations-Lexikon. 13th ed. Parts 72-76. New York: L. W. Schmidt.
Condit, C. L. Painting and Painters' Materials. *Railroad Gazette.*
Delitzsch, Rev. F. Jewish Artisan Life. Funk & Wagnalls. 15 cents.
Denison, Mary A. His Triumph. C. T. Dillingham. $1.
Dixon, R. B. Fore and Aft: a Story of Actual Sea Life. Boston: Lee & Shepard. $1 25.
Dodge, T. A. A Bird's-eye View of Our Civil War. Boston: J. R. Osgood & Co.
Freeman, A. C. Index to the American Decisions. Vols. 81–85. San Francisco: A. L. Bancroft & Co.
Gardiner, C. C. Papers and Biography of Lion Gardiner, 1599-1663. St. Louis.
Gréville, H. Dosia. [Romans Choisis, No. 1.] William R. Jenkins. 60 cents.
Harlan, Dr. C. The Fate of Marcel: a Tale. Philadelphia: J. B. Lippincott & Co. $1 25.
Hopkins, Louise Parsons. Handbook of the Earth: Natural Methods in Geography. C. T. Dillingham. 50 cents.
James, H. Daisy Miller: a Comedy, in three acts. Boston: J. R. Osgood & Co.
Jarves, Mrs. Mary D. The Soul-Winner: a Sketch of the Life and Labors of Edmund J. Yard. Phillips & Hunt. 80 cents.
Knapp, W. I. Modern Spanish Readings, embracing Text, Notes, and an Etymological Vocabulary. Boston: Ginn, Heath & Co. $1 65.
Mercer, Rev. L. P. The Bible: Its True Character and Spiritual Meaning. [New Church Series.] Philadelphia: E. Claxton & Co.
Montgomery, Rev. I. Heart Chords. Cassell & Co.
Murray, D. C. By the Gate of the Sea. Harper & Bros. 15 cents.
Payn, J. Thicker than Water. Harper & Bros. 20 cts.
Platt, Rev. W. H. God out and Man in; or, Replies to Robert G. Ingersoll. Thomas Whittaker. $1 25.
Ponce de Leon, N. Diccionario Tecnológico Inglés-español y español-inglés. Part 3, Bond-Carriage. New York: N. Ponce de Leon.
Power, Rev. F. B. My Soul. Cassell & Co.
Prayer and Promise for Days of Holy Communion. A. D. F. Randolph. 35 cents.
Reade, A. A. How to Write English. J. B. Lippincott & Co. 60 cents.
Spang, H. W. A Practical Treatise on Lightning Protection. New ed. D. Van Nostrand.
Thompson, Dr. W. G. Training Schools for Nurses. With Notes on Twenty-two Schools. G. P. Putnam's Sons.
War-Songs for Anniversaries and Gatherings of Soldiers. Boston: O. Ditson & Co. 50 cents.
Wythe, Dr. J. H. Easy Lessons in Vegetable Biology; or, Outlines of Plant Life. Phillips & Hunt. 40 cents.

NEWCOMB'S
Mathematical Course.

BY SIMON NEWCOMB,

Professor of Mathematics in the U. S. Navy.

Algebra for Schools	$1 20
Key to Algebra for Schools	1 20
Plane Geometry and Trigonometry, with Tables	1 40
Algebra for Colleges	1 75
Key to Algebra for Colleges	1 75
Elements of Geometry	1 60
Plane and Spherical Trigonometry, with Tables	2 00
Trigonometry (separate)	1 50
Tables (separate)	1 40
Analytical Geometry	
Calculus	
Astronomy (Newcomb & Holden). *American Science Series*	2 50
—— The same. *Briefer Course* [Ready September 12.	

HENRY HOLT & CO., New York.

Catalogue for Private Library:

A Blank-book of 240 pp., ruled in columns with printed headings as follows: Title, Author, Publisher, Date of Publication, Number of Volumes, Size, Style of Binding, Remarks. Indexed throughout, alphabetically. Bound in boards, with leather back and corners; size, 8½ x 7¼. Price (*net*), $2 50, post-paid.

Sent, on receipt of price, by Publisher of the *Nation*, 210 Broadway, New York.

Accounts cannot be opened. Purchasers will please remit with order.

ANY PERSONS

Having volumes of First Editions of LOWELL, WHITTIER, LONGFELLOW, BRYANT, HAWTHORNE, IRVING, TAYLOR, or HOLMES, may find a purchaser by writing to the following address, giving condition, date of publication, price, etc.:

C. B. F., P. O. Box 3766, New York.

IF MEMBERS of the Association, and all who desire the preservation of the scenery of Niagara, will send me addresses to which our publications may be forwarded, it will aid the work.

J. B. HARRISON,
Cor. Sec. Niagara Falls Association,
17 William Street, New York.
P. O. Box 105.

NEW CATALOGUE OF RARE, STANDARD, SCIENTIFIC, CURIOUS, ETC.,

American and Foreign Books,

Containing Works printed in XVth, XVIth, XVIIth, and XVIIIth centuries, books printed by Benj. Franklin, Old English Dramas, scarce Americana. Fine vellum binding, etc. Sent on application by
LEON & BROTHER, 78 E. Washington Sq., N. Y. City.

F. W. CHRISTERN,

37 West Twenty-third Street, New York,

Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogue of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

Unmounted Photographs

OF ANCIENT AND MODERN WORKS OF ART,

Embracing reproductions of famous original paintings, sculpture, architecture, etc. Price, cabinet size, $1 50 per dozen. Send 6-cent stamp for new catalogue, 5,000 subjects.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 13, 1883.

The Week.

THE chief domestic event of consequence during the week has been the formal completion of the Northern Pacific Railroad, with appropriate ceremonies. The mere achievement of laying a continuous rail across the continent has long since been taken out of the realm of marvels, and the country can never feel again the thrill which the joining of the Central and Union Pacific lines gave it. On the other hand, fifty years of glowing representations of the natural capacity of the vast area now first fairly made available for settlement, have not enabled the popular mind to realize the full significance of the opening of the third great highway to the Pacific. The public rejoicings, fêtes, and monster processions at St. Paul and Minneapolis, which so interested and perhaps surprised the foreign guests of the occasion, were not an extravagant effervescence. No one can predict the rate of growth of the region now inviting the discontented of all the earth. Forty years ago a single overland caravan from Missouri doubled the population of Oregon on its arrival out. For the past two or three years the steamers plying between San Francisco and Portland have carried northward an average human freight comparable to that brought to the Atlantic shores from Europe. It is perhaps of good omen for the future of the Northwest that these emigrants have been Americans mostly—that is, the best class of pioneers the world has yet seen. The European loses nothing by coming later.

The distrustful attitude which capital has maintained for so many months has apparently relaxed a little during the past ten days. There has been a manifest disposition to invest in railroad stocks and bonds, and the prices of both have consequently been advancing pretty generally for nearly two weeks. It is believed that the initiative of the upward movement of prices was designedly given by experienced operators. But it is also nearly certain that they were first convinced that investors and all others had come to the conclusion that prices of stocks were "low," and therefore safe to buy. The upward movement was stopped by the reports of serious damage by frosts to the corn crop. The expected imports of specie seem about to begin. It is stated that something like 4,000,000 francs is to be shipped from Paris to New York before the close of this week.

The auction sale of blankets of various sorts and grades on the 5th instant has made it more plain than before that there is a marked overproduction of textile goods in the country, and that the tariff, if ever valuable to that branch of industry, has ceased to be so. When the former sales of dry goods were made at ruinously low rates, it was alleged as a reason for the unsatisfactory prices that the goods were unseasonable, and must needs be got rid of at a sacrifice. This cannot be said of blankets sold on the approach of winter. Now, if ever, ought blankets to bring high prices. Yet the concurrent testimony is that they all went at rates from 15 to 26 per cent. below the previously ruling quotations, and that the sales did not realize actual cost to the manufacturers. Yet blankets are among the most highly protected articles in the whole tariff list—that is, if anything can be said to be protected which is first smitten with heavy duties on the raw materials, and then sheltered behind a still heavier duty on the finished product. Manifestly this system has not answered the purpose intended by its makers. There is not the smallest probability that the population and consuming capacity of this country will hereafter outrun the producing capacity of the blanket mills. The evil which exists to-day is not sporadic and temporary. It is chronic, and the only remedy is to be found in untaxed raw materials and access to foreign markets.

These observations, if not yet applicable to the steel-rail industry, are likely to become so. Rails fell to $39 per ton at the beginning of the year, and have since declined slowly and persistently to about $35. We are informed that a contract was made last week by an important railway company below $35. Yet the manufacturers are able to make some profit even at these low rates, the prices of ore and of pig having fallen in a corresponding ratio. The quotation for rails at the Welsh mills, as reported in the London *Economist* of August 25, was £5 per ton, although rails of second class at interior points could be had for £4 10s. At these figures it would be scarcely possible for British manufacturers to sell rails in the United States, even if the duty were wholly removed. Indeed, we think that our manufacturers, if examined separate and apart, and out of the hearing of Judge Kelley, would acknowledge their ability to hold their own against any competitor in the world. But as there is nothing so alarming in protectionist circles as the suspicion that any tub can stand on its own bottom, we must not look for such revelations at present. We are disposed, however, to congratulate the steel-rail makers on the progress they have achieved on the down-hill road of prices, if they have reached the point where British competition is not to be feared under any kind of tariff.

For the purpose of estimating the amount of damage sustained by the corn crop by the frosts of last week, a reference to the census tables of 1880 will prove useful. In that year the total crop reached 1,754,591,676 bushels. Of this aggregate the six States within the "corn belt" proper yielded more than one-half—viz.:

Ohio	111,877,124	Missouri	202,414,413
Indiana	115,482,300	Iowa	105,729,325
Illinois	325,792,481	Nebraska	65,450,135
Total			926,745,778

Nine Southern States produced nearly one-fifth of the total crop, viz.:

Alabama	25,451,278	N Carolina	28,019,839
Arkansas	24,156,417	Tennessee	62,764,429
Georgia	23,302,018	Texas	29,068,172
Kentucky	72,852,263	Virginia	29,119,761
Mississippi	21,340,800		
Total			315,971,977

The sources of growth of 1,243,717,755 bushels, or about seven-tenths of the whole, are seen to be within regions only lightly touched by the recent frosts. Although the northern portions of Indiana, Illinois, and Iowa were somewhat affected, it is not probable that the damage inflicted in those localities was equal to the increase which has taken place in Kansas and Nebraska since the census year. The general average of mischief may therefore be considered as confined to the States of New York, Michigan, Wisconsin, and Minnesota, which yielded in 1880 only 6 per cent. of the whole crop, viz.:

New York	25,690,156	Wisconsin	34,230,579
Michigan	32,461,452	Minnesota	14,831,741
Total			107,213,928

The possible damage from frost would seem to be only 6 per cent. of the total, even if the crop in the last-named States were a complete failure. But it is known to be only damaged in those States, not destroyed. Unless the injury within the "corn belt" proper is greater than has been reported, there would seem to be little cause for apprehension of a corn famine this year.

The decision of the United States Circuit Court that the tax-receivable coupons of Virginia are, notwithstanding the recent legislation of that State, still legal tenders for taxes, is an important victory for the bondholders. The last decision of the Supreme Court left them in an awkward predicament, for the judges, although upholding the view that the coupons were receivable for taxes, held at the same time that the "coupon-killer" legislation was valid to the extent that it superseded the old remedy which the bondholder had previously enjoyed, of mandamus. Up to the time of the "coupon-killer" bills it had always been possible for the bondholder, if the State refused to receive his coupons for taxes, to compel the officials to take them by means of this summary process. The Virginians, to meet this difficulty, resorted to one of the most elaborate and ingenious pieces of legislation ever devised even in a Southern State as a means of getting rid of a pecuniary obligation. First, as a basis for their work, they invented in cold blood the fiction that some of the bonds were fraudulent or spurious, and that it was impossible to ascertain which these were without a judicial inquiry; then they proceeded to require every bondholder who wished to pay his taxes in coupons to prove in court that his bond was not spurious before he could be allowed to do so—a process not only expensive, but involving a delay of years. When this legislation came before the Supreme Court the judges decided that the remedy by mandamus was gone, and that the bondholder had instead the remedy provided by the new law, which, as we have seen, was actually designed by its framers to destroy the

value of the coupons. The legal grounds as signed for the decision were various, but it was universally regarded as a triumph for the repudiators, and so delighted were the Virginians that they fired off many guns when they got the news.

The Virginia Funder Democrats have always complained that they have been treated with great unfairness by the independent press at the North, because it refused to believe that they were much "sounder" on the debt question than their adversaries. They have now, since Judge Bond's coupon decision, an opportunity of giving some evidence of their sincerity, and their action in regard to the decision will be watched with interest. Judge Bond has enjoined the tax-collectors from levying for taxes whenever a tender of coupons in payment has been made, while the Riddleberger-Mahone legislation requires the collectors to levy. Until Judge Bond's decision has been passed upon by the Supreme Court, there will be some doubt as to the validity of his injunction, but not much to those who are familiar with the previous decisions of the Court on the subject. The Funders will, therefore, unless all signs fail, have a chance of "rallying" the debt-paying Virginians, if there is any rally left in them, with the Federal judiciary behind them. The State cannot collect its revenue without taking the coupons, and cannot take its coupons without going in the face of the Riddleberger-Mahone "coupon-killer" statutes. The Funders, it would seem, might force Mahone and his followers to choose between submitting to a repeal of the most disgraceful part of his anti-debt legislation and a defiance of the power of the Federal courts, which he would hardly like to attempt.

A notable demonstration has been made by the Independents of Massachusetts. About two hundred of them assembled in Boston on Saturday, and issued an address which cannot fail to have an important effect upon the approaching campaign in the State. While nearly all the participants in the gathering were Republicans, there were some Democrats present, including John Quincy Adams, and cordial letters of sympathy were received from Leverett Saltonstall and Frank W. Bird. The spirit of the meeting is admirably shown in the address, which declares the Independents ready, regardless of personal preferences, to assist in securing the best nominations, while they will refuse to support merely expedient candidates, even to escape the impending disgrace of Butler's reëlection. The attitude of independent voters everywhere is well defined in this passage: "They stand ready to assist any party with honest and right principles, but they are equally ready to withhold their votes from any party that weakens in its efforts to obtain the reforms which the people demand." It is thought in Massachusetts that the principal effect of the address will be to make certain the nomination of the Hon. Henry L. Pierce for Governor. If this should turn out to be the case, the chances are that Governor Butler would greatly simplify the situation by deciding that, upon the whole, he did not care to run again.

Governor McDaniel, of Georgia, in making appointments to fill vacancies, seems to be very little affected by "petitions." Heretofore, applications for offices have been made to the governors of Georgia by means of papers filled with the recommendations of persons of influence. That these endorsements for the most part have no significance is well known; in fact, the same names often appear on the petitions of rival candidates for the same office. There is reason to think that this practice may, during the present administration at least, fall into utter disuse. When the physician of the Georgia Convict Camp (for Georgia has no penitentiary) died the other day, the Governor immediately appointed in his stead Doctor Westmoreland, very much to that gentleman's astonishment, and to the great indignation of the horde who expected to bring their "influence" to bear upon the Governor. Doctor Westmoreland is one of the most distinguished physicians of the South, and is, besides, entitled to the credit of having caused to be created the very office to which he is now appointed. Another opportunity for executive independence is afforded by the bill to erect a new capitol which now awaits the approval of Governor McDaniel, as it provides for the appointment by him of five commissioners to take complete charge of the matter. Public opinion seems to be confident that men of sterling integrity will be appointed, whether or not they are among those who are seeking the appointment "with most petitionary vehemence."

The acquittal of Frank James will not surprise anybody who has paid much attention to the career of the distinguished family to which he belongs. Like his brother Jesse, he commanded the admiration and esteem of the community, though of course the nature of his occupation bred hostility in some quarters, which sufficiently accounts for the prosecution of Frank. The jury is said to have been composed exclusively of Democrats—a very good way to secure an acquittal, as Frank had been in the war on the Southern side, and there seems to be a belief among Missouri Democrats that any indictment of a fellow-Democrat is presumably a Republican trick to revive the issues of the war. The speeches of counsel, too, show that Frank represented to the jury the cause of Labor against Capital, the prosecuting attorney finding it necessary to argue in his closing speech that it was not "wounded capital that calls upon you to redress its wrongs." Any one will see that the identification of Frank's cause with that of labor was natural enough when he reflects that Frank's life hitherto has been one long war against banks and railroads. We have no doubt that, if the truth were known, it would be found that the signers of the address thanking the prosecuting attorney for his services would be found to be mainly just such men as Frank used to kill and rob—owners of property and employers of labor. Their motives, however, are easily seen through.

The examination of Mr. Jay Gould by the Committee on Education and Labor touching his biography, and his answers to the specific questions propounded to him, throw an air of opéra-bouffe over the whole investigation. Ninety-nine out of every hundred readers of this remarkable testimony will be concerned not with any question of wages or strikes, of education or labor, but solely with the career of Gould as a counter-jumper, a land surveyor, a tanner, a railroader, a telegrapher, and a stock-jobber — things interesting, perhaps, as personal memoirs, and having a relation to the bad side of human nature, but mainly irrelevant to the subject-matter, and calculated to provoke laughter at the expense of the Committee rather than of the witness. Regarded as a fencing match between Gould and the Committee, the advantage was on the side of the former. If it was needful to have Gould's biography spread upon the records of Congress, it was desirable to have the whole of it; yet he bounded like a chamois over the whole of his Erie Railway transactions, including the Black Friday affair, and the Committee never refreshed his memory upon those points. He told them that his large investments in telegraph property were made in order to get a situation in the Western Union Company for a very dear friend of his. He said that he had no objection to the Government regulating the charges of all corporations provided it would also guarantee them good dividends. He thought there was no more "water" in Western Union than in any other company he was connected with! On cross-examination he declined to mention any other. He considered real estate in New York mostly "water" because lots on Broadway had been bought originally for a handful of colored beads or a few pounds of tobacco. He did not believe that any rival telegraph company could do much damage to the Western Union, because he had tried the game himself, and had failed. He was willing to sell out to the Government, or to hold on to his property—the only thing he objected to was the Government's setting up a rival telegraph with the proceeds of public taxes. This he considered confiscation. Any rivalry or competition based upon fair play he was ready to take his chances in. To the searching inquiry addressed to him by the Committee: "Do you think that the laborer gets his fair share of the vast accumulating wealth of the country?" he gave the profound answer: "I do." He added that it is impossible to adopt any general rule to prevent poverty or ameliorate the woes of the poor, but the best advice he could give them was that given by a late well-known philanthropist — viz., "Go West." He recommended with earnestness that something be done "to educate the masses and to elevate their moral standard." He did not say that he had contributed his own example to the realization of this boon, but the public will easily supply the omission.

Mr. George Blair, who knows what monopoly is through being a manufacturer of packing-boxes, but at the same time represents the cause of labor in being the Chairman of the State Committee of the National Labor party,

gave some very interesting evidence before the Senate Committee on Monday. Experience shows, he says, that "a person can go through life very comfortably on $25,000 a year." From this simple premise, which nobody but a madman would deny, he derives the following important conclusions: First, that Government bonds should be taxed; second, that the remedy for the present low price for making packing-boxes is a law making a uniform reduction of the hours of labor; third, that there should be a National Bureau of Industry to regulate the hours of labor, and that this bureau should determine how many persons should be employed in any particular trade, placing the "surplus" at other occupations when any one trade becomes overcrowded. This shows that the severest problems presented by the labor question can be readily solved when approached by an unbiassed reasoner. It is hardly necessary to add that the Bureau ought also to prescribe what occupations the citizen shall engage in, and what he shall be prevented from taking up. This work is, to be sure, pretty effectively done through the tariff by Congress, but then a Bureau might do it better.

An interesting letter in the *Evening Post* on the dulness of the Newport season attributes this curious fact in part to the hostility between different "sets," and strongly hints that this hostility itself grows out of the suspicion and distrust with which some of the newly rich are regarded there by the permanently but fastidiously poor. This is a risk which society in its present phase of development will have to face and meet with courage and decision. At first it may seem as if it were an old difficulty, but it has assumed proportions which are wholly new and may fairly be called appalling. Until recently the newly rich were "admitted" by society after a more or less careful pass-examination of their credentials, a private comparison of notes by the "leaders" as to their appearance, their manner of dressing, talking, in fact the general suitableness of their behavior for the standards recognized as fitting in social life. Consequently, the newly rich always looked upon their admission as a favor, and used their best endeavors to conform their lives to those of the people who had let them in. The position of wealth, however, as compared with birth, breeding, education, refinement, etc., has so much improved of late years that it is no longer disposed to ask any favors. It feels that it now constitutes the basis of social life, and that instead of asking for admission it ought to impose terms and set standards of its own. It is now engaged in a struggle to establish this right, which, naturally enough, vexes and irritates the conservatives, who try to keep up the old relations between things. In the end, of course, the conservatives must go to the wall; but meantime the conflict must tend now and then to eclipse the gayety of fashion.

The *Herald* published on Friday a page and a half of information about Peru and Chili, the most important part of which consists of an interview with Admiral Lynch, in command of the Chilian army of occupation. What he says confirms the view we have frequently expressed in these columns as to the Iglesias movement—that it affords the only reasonable chance which Peru now has of extricating herself from her difficulties, Iglesias having the active support of Chili. He is, of course, a revolutionist; but any government which succeeds in establishing itself in Peru now must be revolutionary. To judge from his recent pronunciamiento, he sees—what too few Peruvian leaders see—that the country now most needs, not eloquence or a readiness to die in defence of the soil, but order and quiet, the regular administration of justice, the disbanding of the "troops" that are now robbing and murdering in the interior. Admiral Lynch declares that the Iglesias treaty will be carried out, or if that fails that Chili will "decree" peace. The treaty, it will be remembered, provides that Chili shall take the best part of Peru, the nitrate and guano territory, and by "decreeing" peace the Admiral undoubtedly means that he will simply annex this portion, and withdraw his troops from the rest of the country, leaving the Peruvians to settle their dispute as to their rival "governments" as best they can.

Affairs in Croatia are apparently taking a more peaceful turn, owing to a rapid display of energy on the part of the Hungarian and Imperial authorities. The Hungarian escutcheon, with the bilingual inscriptions, was replaced in Agram on Thursday by order of Baron Ramberg, the successor of Ban Pejacsevich, amid imposing ceremonies and a grand flourish of military trumpets. A proclamation exhorting the people to remain quiet was issued, but had no effect, for the next evening the windows of the Government offices were smashed by the mob, who had to be dispersed at the point of the bayonet. On Saturday, Jewish houses became the objects of popular assault, the more readily because of the leniency with which similar outrages had been dealt with across the Hungarian border. But the Hungarian Government had become tired of anti-Jewish riots, and earnestly concerned about all kinds of riot and agitation in Croatia. The infantry fired upon the mob, and the hussars cleared the streets. Similar collisions, not entirely bloodless, took place in the rural districts, military reinforcements arriving from Styria and other parts. A new attempt by the Agram mob on Sunday was easily quelled. A number of citizens offered their services to preserve order, and both the city and country have resumed a more quiet appearance. It is, perhaps, owing to this unexpected abatement of the Slavic fever in Croatia that the London *Telegraph*, *Standard*, and *Post*, eager for a new outbreak in the east of Europe, have at once turned their eyes toward Bulgaria, and there discovered, in the hands of Russian conspirators—abettors of Prince Alexander—the lighted match which is to set the whole Slavic world on fire. Already "a large number of Russians, evidently military officers, are crossing the frontier on the way to Bulgaria," says a Cracow telegram.

The hostile feeling excited between the masses of the Italian and French peoples by the French occupation of Tunis two years ago, and which at the time led to bloody collisions between Italian and French laborers in various cities of France, seems undiminished. It enabled Prince Bismarck to draw King Humbert into the Austro-German alliance in spite of Romance race sympathies, Garibaldiism, and Irredentism. A new manifestation of it has been caused by the recent earthquake in Ischia. On the one hand, Emperor William—a monarch not particularly remarkable for charitable munificence—has contributed out of his private purse 50,000 marks to the fund started by the Crown Prince and Crown Princess of Germany in aid of the surviving islanders. The gift was announced to the public on the morning of the Emperor of Austria's birthday, during the celebration by the German Court, and in the evening the official journal contained the hearty thanks which the King of Italy—"der dritte im Bunde"—had transmitted through his embassy in his own and his Government's name, to the German Imperial family and "to all the German nation." On the other hand, collections to the same end had also been undertaken in France; but Rochefort, trusting to French resentment against the Italian alliance with Germany, ventured to accuse King Humbert, in the *Intransigeant*, of pocketing the sums collected in France, while urging Germany to annihilate the Republic. Challenged to a duel by an Italian officer, Rochefort refused to fight; but a committee of the survivors of the earthquake at Naples have resolved not to accept any more charitable gifts from abroad in view of such atrocious insults to the Italian nation.

The news of China's warlike operations last week has not been confirmed, and little confidence can be placed in the rumors of negotiations which have meantime been superabundant. What is hardly open to doubt is that the Governments of France and China are equally anxious to secure a peaceful solution of the difficulty between them by some arrangement compatible with national honor. But national honor in Pekin demands the preservation of Chinese suzerainty over Anam, and national honor in Paris demands a denial of that suzerainty. The *République Française* speaks, perhaps, the present thought of the French Cabinet when it asserts "that France is willing to recognize an honorary suzerainty of China in Anam, but cannot admit of the existence in Tonquin of a French protectorate and Chinese jurisdiction; that the rectification of the frontier will be necessary . . . for the purposes of trade; and that the proposition of a neutral zone is inadmissible." In the meantime France strenuously prepares for war, sending or ordering heavy reinforcements to the East; and our Government has just received official information of the blockade by the French navy of the Gulf of Tonquin and of the ports of Anam against vessels carrying cargoes of war material. In the Treaty ports, the natural feeling of anxiety on the part of the foreign settlements has just been aggravated by the mob in Canton, accidental as this appears to have been, and without immediate political significance.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, September 5, to TUESDAY, September 11, 1883, inclusive.]

DOMESTIC.

THE formal completion of the Northern Pacific Railroad, by the driving of the last spike, took place fifty miles from Helena, Montana Territory, last Saturday afternoon, in the presence of many people, including the foreign guests. President Villard made an address, sketching the history of the work, and was followed by Mr. William M. Evarts. The latter, in his oration, defended the policy of the Government in giving public lands to assist in building the transcontinental railroad lines. Addresses were also made by several of the foreign guests and by the Governors of a number of the Northwestern States and Territories.

The corner-stone of the new Capitol at Bismarck, D. T., was laid last Thursday. Remarks were made by Governor Ordway, Mr. Villard, General Grant, ex-Secretaries Evarts and Schurz, Secretary Teller, and others.

President Arthur returned to Washington last Friday.

The Secretary of the Interior has received from ex-Senator Ramsey, of the Utah Commission, a communication in which he says: "The law known as the 'Edmunds Act,' so far as we have been responsible for its execution, has been carefully but rigidly enforced this year, as it was last. No person living in polygamy has been permitted to vote at any election or to be voted for for any office; and while only three convictions in prosecutions against polygamy under the act of 1862 have been secured, nearly or quite 15,000 persons have been disfranchised on account of polygamic practices through the operations of the law as administered by this Commission."

The report of the committee that has investigated the office of Supervising Architect Hill is in the hands of Secretary Folger. It is understood that it charges that the Architect's office has been controlled by official favoritism, and conducted in the interest of rings; that the system which has been adopted has practically destroyed the possibility of competition in many important matters; that favored contractors have obtained all the contracts for heating apparatus, for safes, and for elevators, and that the work in many instances has been imperfect and contrary to the specifications. The committee, however, do not charge any personal corruption on Mr. Hill.

Civil-Service Commissioner Thoman, who has just returned from California, says that he was earnestly supported in his efforts to establish the reformed system by the local officials there, and that civil-service reform is now an accomplished fact.

The banks in several cities have refused to accept the new postal notes, and it is thought that their form will have to be modified to render them less liable to errors.

Since the new changes in the tariff and internal-revenue laws large quantities of matches have been imported into this country from Sweden, one house in this city having imported already 125,000 gross. The price of American matches has been reduced from $2.60 to fifty cents a gross.

The United States Consul at Naples, in a report to the State Department, says that because of our new tariff on art works the Italian Government will probably impose an export duty of 30 per cent. on all American art works by American artists in Italy. The effect of this, the Consul says, will doubtless be to drive all American artists out of the country.

There were reports early this week of serious damage to the Western corn crop by the frost, but later estimates show that the first reports were exaggerated. In Niagara County, N. Y., the frost was very severe, killing the corn, as well as buckwheat and late vegetables. The loss to farmers there is estimated at from $100,000 to $200,000.

The National Cotton Exchange of America makes the following report of the cotton crop for the years ending August 31, 1882, and 1883: Net port receipts, 1882, 4,688,037 bales; 1883, 6,009,612 bales.

The total number of immigrants landed at this port for the eight months ending August 31 was 284,966. This is a decrease of 58,572 from the number landed during the corresponding period last year.

Governor Cleveland, of New York, said last week, speaking of his administration: "Perhaps some people have exaggerated my 'independence,' as you call it. I haven't exiled myself from acquaintance with politicians, or shut myself up from them. No man in my place could do so successfully. An Executive is necessarily much indebted to public or semi-public men from the various localities of the State for information and advice. Of course, I couldn't follow everybody's advice. I had to choose, and did the best I could. This is a big State, and every part of it has its local preferences."

Governor Cleveland has formally approved the report of the New York Civil Service Commission, classifying the positions under the State Government.

In the selection of delegates to the New York Republican State Convention thus far there has been entire harmony and no disposition to make contests in any county between Stalwarts and Anti-Stalwarts. In this city the district associations have so amended their constitutions that any person who voted the Republican national ticket in 1880 may participate in the primary meetings this month.

A conference of Independents in Massachusetts was held in Boston last Saturday, Prof. Francis A. Walker, Representative-elect Lyman, Prof. F. J. Child, of Harvard, Samuel Bowles, and John Quincy Adams, jr., being among those present. An address to the people was adopted setting forth the necessity of defeating the principles represented by Butler, and warning existing parties that the formation of a third party can only be averted by a consistent advocacy of civil-service reform, tax reform, economy in State affairs, and wisdom in legislation.

The New York Greenback State Convention has nominated the following ticket: For Secretary of State, Thomas K. Beecher, of Chemung County; for Comptroller, S. L. Halsey, of Otsego County; for Attorney-General, Lewis F. Post, of New York; for State Treasurer, Julian Winne, of Albany County; for State Engineer, Edwin A. Stillman, of Ontario County.

Judge Hoadly's physician says that the reports that he will retire from the contest for Governor in Ohio are false. The anti-McLean Democrats of Hamilton County have nominated a full independent local ticket. In Cleveland a local ticket in the interest of Bookwalter for United States Senator has been nominated, and there is much bitter feeling.

The colored citizens are excited over a call that has been issued for a convention of colored men to be held soon in Louisville, Ky. Fred Douglass is a defender of it, while other colored leaders, like Professor Langston, think it injudicious because it seems like offering support to the Democrats in exchange for offices.

Prof. Willard Fiske, ex-Librarian of Cornell University, has begun an action to annul the will of his wife, which leaves $1,500,000 to that college and $300,000 to him. The principal points raised by him are that the charter of Cornell University prohibits it from holding property exceeding $3,000,000 in value, and that that limit has been reached; and also that the statutes of this State forbid any person having a husband, wife, child, or parent to bequeath to a benevolent, charitable, literary, scientific, religious, or missionary corporation more than one-half of his or her estate after the payment of debts. The reply sets forth an ante-nuptial agreement between the Professor and his wife in which he agreed that she should dispose of her property after the marriage just as if she had remained single.

Chief Justice Coleridge was honored with a dinner in Boston last Saturday evening. He made there his first speech in this country, warmly praising America, and said, speaking of the United States and England: "We are bound together, if I may reverently say so, by God himself in golden chains of mutual affection and mutual respect; and two nations so joined together, I am firmly convinced, man will never put asunder."

Reports to the National Board of Health show that Dayton, O., has the lowest death-rate of any city in this country.

The steamship *William Crane*, for Baltimore from Savannah, narrowly escaped burning on Tuesday, September 4, near Frying-Pan Shoals. Three hundred bales of cotton and a number of barrels of turpentine were thrown overboard, and after fourteen hours hard work the fire was extinguished. The vessel was badly damaged, and the loss to the cargo exceeds $25,000.

The boiler of the Hudson River steamboat *Riverdale*, which exploded near this city, has been raised. It was found that the bottom part of the shell was badly corroded, and in the place where it had burst it was only one-sixteenth of an inch thick. The other boiler of the same boat was in no better condition.

Frank James, the Missouri outlaw, was acquitted last Thursday. The verdict was received with applause. He says he now wants to live a quiet, honest life, but he is held on other indictments.

The Central Labor Union had a parade in this city on September 5, in which about 8,000 men participated. Some of the banners were inscribed as follows: "Jay Gould Must Go"; "We Must Crush Monopolies Lest They Crush Us"; "Every Man Must Have a Breech-loader and Know How to Use It"; "The Wage System Makes Us Slaves"; "Down with Oppressive Capital"; "Prepare for the Coming Revolution"; "Workers in the Tenements, Idlers in the Brown-stone Fronts."

First-Lieutenant John M. Porter, of the Third Cavalry, stationed at Fort Thomas, Arizona, is short in his army accounts, and has fled. He is a West Point graduate.

Messrs. Moody, McGranahan, and Whittle, the evangelists, will leave this country on October 2 for Ireland, where they intend carrying on an active missionary campaign in the south of the island.

Andrew Varick Stout, long prominent in this city as a bank president and as a wealthy citizen of large benevolence, died on September 5, aged seventy-one years. He began life as a teacher in the public schools. A few years ago he made a gift of $50,000 to the Drew Theological Seminary, and one of equal amount to the Wesleyan University at Middletown, N. Y.

FOREIGN.

The question of peace or war between France and China is still undecided, and the reports about the negotiations are conflicting. Li Hung Chang is said to be in favor of a peaceable solution of the difficulty, while the intriguers who surround the court are urgent for war. According to one report, which is said not to be wholly accurate, the following are the principal points of an agreement proposed by the Marquis Tseng, the Chinese Ambassador, to the French Minister: The French protectorate to be hereafter confined to the Delta and the Red River; China to open the navigation of the Red River up to Lao-Kay, which shall be the only point open to trade with Yun-Nan; the frontier at all other points to be closed by the establishment of a neutral zone, which shall be garrisoned by the Anamites;

China to undertake to prevent further incursions of the Black Flags; the suzerainty of China over Anam to be recognized by a mere act of homage, after which China will recognize the treaty of Hué; the French force of occupation to be limited to 4,000 men. It is further reported that China demands that her suzerainty of Anam shall be sustained exactly as it hitherto existed, and any idea of a merely honorary suzerainty will not be entertained by the Chinese Government. The Paris *République Française* says that France will insist upon maintaining a protectorate over Anam, which will in no way prejudice Chinese interests; that France is willing to recognize an honorary suzerainty of China in Anam, but cannot admit of the coexistence in Tonquin of a French protectorate and Chinese jurisdiction; that the ratification of the frontier will be necessary, with one point for the purposes of trade, and that the proposition for a neutral zone is inadmissible.

China objects to the sending of French reinforcements to Tonquin while the negotiations are pending, and the French press insists that they must be sent. A Hong Kong despatch says the people of China seem to have little fear of the result of a war with France, and believe that with their new armaments and the improved discipline of their forces, the nation is far better able to cope with a foreign enemy now than it was in the war of 1860. The London *Times* points out that in the event of war the Americans, Germans, Japanese, and even the Chinese themselves, would secure more of the foreign and coasting trade in the east than the French. A Chinese mob at Canton has burned the houses of several European merchants, and also their wharves, causing great consternation among the foreign residents, most of whom sought refuge on board vessels in the river. No violence was offered to persons, and a force of Chinese troops was called out, which quickly dispersed the rioters. On the receipt of the intelligence at Hong Kong several gunboats were immediately sent to Canton to afford protection to the foreign merchants. The British Admiral in command in Chinese waters is left to act as he thinks best under the circumstances. It is said that the riot was caused by a number of Portuguese sailors killing a Chinaman, and that the French question was not involved in it.

Baron von Ramberg, the military commander, entered last week upon the discharge of his duties as successor to the Ban of Croatia. He issued a proclamation declaring his task to be the re-establishment of peace and the restoration of the official notices on state buildings, in order to show that street riots cannot settle political questions. Accordingly on Friday the Hungarian escutcheon, with bilingual inscriptions thereon, was replaced on two Government offices. That evening an anti Magyar mob assembled and smashed the windows of the Government offices. The troops were ordered out by Baron von Ramberg, and the rioters were dispersed at the point of the bayonet. A crowd of persons collected at Agram on Saturday and smashed the windows of a café and several houses occupied by Jews. The military were called out, and fired on the mob. The communal elections have been postponed through fear of further outbreaks. The Mayor of Agram has issued a proclamation forbidding the assembling of groups of persons and prohibiting people from walking abroad after dark. The Hungarian Prime Minister has summoned the principal notables to Agram, including the former Ban, to devise means for the suppression of the disorders. The peasants living between Glina and Petrinia are in full rebellion. The movement is directed chiefly against the landowners. A strong military force has been despatched to the scene of the disturbance. The Bishop of Veszprèm has issued a pastoral letter in which he declares that Jew-baiting is unchristian, and exhorts the clergy to use all their endeavors to divert their flock from following such a dangerous path.

The will of the Comte de Chambord gives 500,000 francs to the Societas de Propaganda Fide, 100,000 francs for the benefit of the poor of Paris, 150,000 francs to the convent at Göritz, a large part of his fortune to the Duc de Parma, and a smaller part to the Comte de Bardi, and the income of 20,000,000 francs to the Comtesse during her life, less 2,000,000 francs variously bequeathed. After the demise of the Comtesse the Comte de Bardi is to receive one-third and the Duc de Parma two-thirds of the entire property. The estate is said to be worth 60,000,000 francs.

Don Carlos, the Spanish pretender, is in Venice. He has written to the leader of the Legitimists in Spain declaring that he belongs to Spain alone, and will belong to her always.

King Alfonso of Spain arrived last week at St. Sebastian, and was received with enthusiasm by the populace. He declared that he would not consent to the pardon of rebellious officers of his army, whose immunity from punishment hitherto has been the principal cause of the recent uprisings.

The unveiling of the statue of Lafayette took place last Thursday at Le Puy, France, in the presence of an immense crowd of people. The streets were decorated with American and French flags, and triumphal arches were erected over the prominent avenues. Among the persons present were Mr. Morton, United States Minister to France, and Mr. Sargent, United States Minister to Germany.

The *North German Gazette* has printed a conciliatory article, saying that in all questions pertaining to its foreign policy since the last war the Government of Germany has strictly observed toward France a benevolent and friendly attitude, and is prepared to observe the same attitude in the future whenever France sees fit to assert her interests in a legitimate manner. Referring to a recent article in the London *Times*, the *Gazette* says also that if the *Times* retained its former acumen it would perceive that the recent article in the *Gazette*, which was written to maintain peace, helped to lessen the tension between England and France, the effect of which was eloquently shown in the release by the French in Madagascar of Mr. Shaw, the English missionary.

The Marquis of Hartington, British Secretary of State for War, speaking at Sheffield, England, last week, said it was a mistake to suppose that the arrest of Mr. Shaw by the French in Madagascar was sufficient ground for a quarrel with France, or that the release of Mr. Shaw removed all ground for offence. The Government, he said, hoped that France would make a satisfactory explanation of the matter.

An article printed in the Paris *Intransigeant* by Henri Rochefort has aroused great indignation throughout Italy. It accused the King of having pocketed the money subscribed by the French people for the Ischia sufferers, while he was at the same time urging Germany to annihilate France. At a meeting of a committee of the Ischia survivors a resolution was adopted declaring that they would refuse all proffers of aid, on the ground that when charity is offered them in order to serve as a pretext for insulting their King they feel that it is their duty to reject such charity from the whole world.

M. Bratiano, Prime Minister of Rumania, has had a conference with Count Kálnoky, the Austro-Hungarian Minister of Foreign Affairs, and with Prince Bismarck for the purpose, it is said, of finally arranging the terms of an alliance of Rumania with Austria and Germany similar to those of Italy with these Powers.

The celebration, on September 12, at Posen and elsewhere in Prussian Poland, of the bicentenary of the raising of the siege of Vienna by Sobieski was originally forbidden, but the prohibition in regard to stage plays has been removed in several districts.

The manifesto issued by Prince Alexander, of Bulgaria, announcing the appointment of a commission to draft a new constitution for Bulgaria, is reported to have been forced upon the Prince by the Russian Envoy and the Russian Generals Soboleff and Kaulbars. Prince Alexander, who was anxious to rid himself from the tutelage of the Generals, at first refused to accede to the demands of the Envoy. The latter then threatened that, if the Prince persisted in his opposition, a decree would be issued by the Czar of Russia releasing the Bulgarians from their allegiance to Alexander, and that General Soboleff would be appointed temporary agent. Upon this threat the Prince retreated from his position and issued the manifesto referred to. A despatch from Vienna says it can be positively stated that the object of Russia is to get rid of Prince Alexander and place its own nominee upon the throne; but that none of the Powers will, however, tolerate the usurpation of the throne of Bulgaria by a Russian pretender, even though he should prove to be the Grand Duke Sergius or the Grand Duke Paul. The London *Standard's* correspondent at Berlin says that the joining of Rumania in alliance with Austria and Germany is the answer to the Russian *coup d'état* in Bulgaria. He adds that the relations now existing between Germany and Russia are more than cold, and says it is reported that the Russians are concentrating an armed force north of the river Pruth, between Rumania and Bessarabia.

The cattle plague continues its ravages with unabated fury in Russia. More than a million cattle have fallen victims of the plague within the past four years in European Russia

The Vatican has adopted a very important decision in regard to the Church question in Prussia, which will permit of the removal of the misunderstandings existing between the Prussian Government and the Pope, and render the resumption of negotiations probable.

The Archbishops of New York, Baltimore, Cincinnati, and Philadelphia, and several other prelates, are expected at the Vatican soon, to confer with the Propaganda upon the extension of Church regulations to the clergy of America.

There was a great demonstration at Waterford, Ireland, last Sunday under the auspices of the Irish National League. Resolutions were passed demanding a Parliament for Ireland, not only in name but in reality, and declaring that Ireland must have that which England by the necessity of the time granted to Canada because Canada was rebellious. Michael Davitt in a speech denounced the Land Act as entirely inadequate to the needs of Ireland. He said that not one-sixth of the land cases had yet been heard, and that when they had been all settled the reduction of rent would not amount to £1,000,000.

The police have discovered that one Terence McDermott purchased in Glasgow two lots of glycerine several weeks before the explosions there took place, and that he carried them to a factory at Birmingham, where they were probably converted into nitro-glycerine, and then used in the attempt to destroy public buildings in Glasgow.

An official report of the recent disaster in Java has not yet been published. The number of natives killed at Bantam, Batavia, and Lampong is estimated at 30,000. The number of Europeans lost is unknown.

The Cromwell Line iron steamer *Canima*, of 546 tons, from New York for St. Johns, N. F., was wrecked last Thursday morning on Gull Island, at the mouth of St. Mary's Bay. She sank almost immediately after striking. The passengers and crew, sixty in all, got ashore safely owing to the skill and coolness of Captain Farquhar.

THE TIMBER-CULTURE ACT.

THE first publication from the Forestry Division of the Department of Agriculture since its reorganization is before us. It is in the form of a preliminary report on the 'Forestry of the Mississippi Valley and Tree-Planting on the Plains,' and is by Mr. F. P. Baker, of Topeka, Kansas. This report, like other similar productions of the prairie, hints at the general depravity, ignorance, and malversation of certain Eastern men of science who at various times have suggested that the Western plains were treeless from lack of a sufficient moisture to insure a growth of trees, or even that the breaking up of a few acres of prairie ground might not, perhaps, cause a permanent increase of rainfall west of the Missouri. Such slanders are treated at the West with the contempt they deserve; and the confiding settler, under the inspiration of such Government reports as this, still plants trees, and expects to gather abundant crops from the high, dry plains of western Kansas and Nebraska.

A consideration of the Timber-Culture Act occupies a considerable portion of Mr. Baker's report, into which he has gathered from different sources a large amount of evidence in regard to the practical working of this law. The information thus obtained is to a certain extent valuable and suggestive. The testimony points clearly to the fact that the law, as at present constructed, makes frauds upon the Government possible and easy. The Timber-Culture Act, as is well known, enables a settler to obtain a quarter-section of Government land upon condition of planting and properly cultivating during several years a certain number of trees to the acre upon a small portion of his claim. The law of course contemplated that when a timber claim was taken it should be held as such, and that the requisite number of trees should be planted and duly cultivated. But it appears from the testimony collected that it has become a general custom for speculators and non-residents to take up timber claims, neglect entirely the provisions of the law, and then sell them, often with a large bonus, to persons wishing to make entries under the homestead or preemption acts. It follows that the object of the law—the extension of wooded areas upon the prairies — is defeated, and speculation and fraud are facilitated.

The remedy for this evil would seem to be, as Mr. Baker suggests, the adoption of the principle that "once a timber claim always a timber claim"; that is, that land once filed under the Timber-Culture Act, should be permanently withdrawn from entry under the preemption or homestead acts. The suggestion is a good one as far as it goes, but neither Mr. Baker nor any of the witnesses he has called in to testify as to the working of the law, has detected its real weakness or shown in what it requires essential modification. The act opens for timber-culture entry all land belonging to the public domain not already timber land, or not mineral or desert land. The Government, therefore, encourages the planting of trees in any part of the public domain, without regard to its fitness to produce trees. The law in this way is in many cases misleading and unjust to honest settlers, encouraged by the belief that an enlightened government would not present land to them upon conditions which could not be, under any circumstances, fulfilled. From the one hundredth meridian to the Pacific Ocean the line between forest and plain is sharply drawn. The mountains, and especially the high mountains, are timbered; the valleys and plains are totally destitute of timber, except along the immediate borders of the larger streams. They are destitute of trees because they do not receive sufficient moisture to cause trees to grow. It is useless to plant trees in such situations, and if a man is induced to do so, under Government encouragement, he is defrauded and swindled. We make this statement with a complete consciousness of what is in store for us. We are prepared for the worst. We fully expect to be spoken of as "one of them professors," or even—but that would really be too dreadful—as "scientific." When we think of the tornado of obloquy, rolled up from the Missouri to the Colorado, which will soon reach us, we can hardly resist self-laudation at our own boldness.

According to Mr. Baker's statement, 9,000,000 acres of land are at present held under the provisions of the Timber-Culture Act. Those persons, however, best informed upon the subject would, we believe, be surprised to learn that there are 10,000 acres of healthy, vigorous forest trees growing upon timber claims in the whole United States. Such plantations may exist, but unprejudiced and observant travellers in the West have failed to discover them. In Arizona, where numerous timber-claim entries have been made, it is safe to affirm that no planted tree is now growing or can grow without irrigation. This is equally true of Montana, Idaho, Wyoming, Colorado, New Mexico, and Eastern Oregon and Washington Territory. In all the region occupied by these States and Territories trees grow upon the mountains and not in the valleys, where the timber claims are located, and where without irrigation trees will not grow. This is largely true of California and of Western Kansas, Nebraska, and Texas. The Timber-Culture Act was passed with reference to the requirements of Minnesota, and, with certain modifications, was well adapted, if honestly taken advantage of, to develop prairie planting. The trouble is, however, that the distinction between the climatic conditions of Minnesota and those of the dry, parched valleys and plains of the far West was not considered. The law, unless repealed entirely, should certainly be so modified as to include in its workings only the prairie portions of Minnesota and Missouri, all of Iowa, and the eastern portions only of Dakota, Nebraska, and Kansas. The remainder of the public domain, outside of the region described, should be excluded from its workings on the ground that the Government should not encourage the planting of trees where trees cannot be made to grow.

The question, however, which presents itself is whether, under the circumstances, and in view of the fact that the best land belonging to the Government in those States where tree-planting is climatically possible, is already in private hands, it would not be wiser to abolish the Timber-Culture Act entirely. It has failed deplorably even in Minnesota to accomplish what was honestly expected from it, and, on the whole, it has probably delayed rather than advanced the increase of forest area upon the prairies.

THE CONDITION OF MR. GLADSTONE'S MINISTRY.

IT is now more than three years since Mr. Gladstone's Government came into power, leading a Parliamentary majority larger and more enthusiastic than has been seen in England in this generation. Much has happened since then. The Ministry have been driven by stress of weather into seas which they never meant to navigate, and among shoals from which escape seemed sometimes impossible. However, the same fortune which threatened them at one time befriended them at another; and though they have more than once seemed on the verge of falling or of breaking up, though they have lost three of their most eminent members in the Duke of Argyll, Mr. W. E. Forster, and Mr. Bright, though the zeal of their followers has grown far cooler, still they stand to-day not substantially weaker than they were at the close of their first session in September, 1880.

Their greatest dangers were encountered in 1882, when the failure of Mr. Forster's efforts to pacify Ireland, and the outburst of feeling which followed the murder of Lord Frederick Cavendish and Mr. Burke, shook the confidence of the nation in their wisdom or their courage. These dangers passed by, and the last session closed quietly enough. In this session they have had less serious risks to face, yet such as have sometimes proved fatal to weaker cabinets. The first came from the Bradlaugh difficulty, which has dogged their steps since the beginning of the present Parliament. They resolved to meet his case by permitting him, since the House of Commons would not let him take the oath, to substitute an affirmation for the oath. The country, however, disliked Mr. Bradlaugh too heartily to look at the matter in its legal aspect, and a good many Liberal members joined the Conservative Opposition and the Irish Opposition in voting against the bill. Its defeat by a majority of five was not such a defeat as requires a Ministry to resign, for the question was not strictly a party one, the Affirmation Bill having formed no part of Mr. Gladstone's regular political programme. Still, a defeat is a defeat; and it was thought at the time that the Liberal party would become demoralized by it, and the Government lose their hold on their supporters. This did not happen, and after three weeks the affair was practically forgotten.

Not long afterward it was discovered that so much time had been wasted during the first half of the session in idle debates and in the discussion of the Bradlaugh Bill itself, that some of the chief measures promised in the Queen's speech would have to be dropped, and only a small harvest of legislation reaped for the year. This was a second and heavier cloud rising to overcast the sky, because the Liberal leaders had, when opposing Lord Beaconsfield's Government, made it their chief

charge that he neglected domestic legislation, and because they had themselves, in November last, carried a set of new rules of Parliamentary procedure on the plea that by its means they would be able to get more and better work out of the House of Commons. To turn out no better work than their predecessors, after having demanded and obtained a new set of tools, must, everybody said, damage the Cabinet in the eyes of the country. The Liberals became uneasy, and the Tories saw their dismay with the more satisfaction because the result could not fairly be charged either on themselves or on the Irish members. Great prolixity of talk there had certainly been, but no open or deliberate obstruction, nothing which took the blame off the shoulders of the majority, who are of course primarily responsible for the way in which business is done and time spent. However, the months of July and August saw more work accomplished than had been hoped in June. The total legislative crop is less than the better years of Mr. Gladstone's first Ministry showed, but as large as, or larger than, was reaped in any year of Lord Beaconsfield's reign. Moreover, the Tory party has always derided the impatience of the reformers and deprecated over-legislation, so that it is not so well placed for raising these complaints; and, on the other hand, it cannot be said that there is really much eagerness in England for changes of any kind.

The third and last of the difficulties which shook the Government was of their own making, and ought therefore, according to the usual rule in such matters, to have given them the most trouble. It arose out of their Suez-Canal negotiations with M. de Lesseps. Their bargain made with him on behalf of the British shipowners was received by the mercantile class with a shout of disapproval. Their most faithful friends scarcely defended it. Their enemies had the public with them in deploring or denouncing the incapacity of Ministers who could show so little business shrewdness. The *Times*, long on the watch for an opportunity of striking them, thought they were down, and struck hard accordingly. For a week it was supposed, just as it had been supposed after the Bradlaugh division, that the blow to their reputation and influence was a mortal one: they might hang on for a while, but they could never be strong again. Just as in the Bradlaugh case, these anticipations were falsified. There was a reaction from the vehemence of the first outbreak. The Conservative leader, in trying to move an indirect vote of censure, gave the Liberals an opportunity of rallying to the Government; and as the agreement had by this time been dropped, their rally implied no approval of its terms, but was merely a declaration of confidence in the Government itself. The little quarrel with the House of Lords with which the session now usually winds up, as an Irish wake does with a fight, has this year been short, and has placed Lord Salisbury and the Lords once more in the attitude of landlords fighting for their own pockets. If they had wished to give Mr. Gladstone a lift before the recess, they could not have done better. The country is always pleased to see Ministers resisting the Lords on a question affecting the land, and still more pleased to see the Lords obliged to submit.

Though the game of the session has again been won by the Government and lost by the Opposition, this is owing just as much to the mistakes of the latter as to the skill of the former. There has been a want of muscle in the Government several times, and a want of judgment in divining popular sentiment. They do not push on business with the same vigor which Mr. Gladstone displayed in the years between 1868 and 1873. They have allowed the zeal of their followers to wax cold before they had made any adequate use of it. If the Conservatives were led by a man like Peel—a man who could play the rôle of a reasonable though keen and watchful critic, anxious that the authority of the executive and the reputation of the country should be maintained, and therefore slow to embarrass the Government by frequent attacks or vexatious questions, but who was also capable on occasion of concentrating his forces for a pitched battle, and filling them with ardor by his own energy and dash—if they had during the last three years possessed such a man, the Ministry would probably have before now fallen. Sir Stafford Northcote has all the knowledge, all the acuteness, all the reasonableness and balance of mind required for a leader, but he wants that authority over his own party which would have held them back from unprofitable skirmishes, and he has none of the *élan* with which one ought to charge at the head of a column. More often than not in his attacks he selects the wrong occasion and incurs a needless defeat. Over and over again he has allowed the Government to escape from him, as David slipped through the fingers of the Philistines, when he might have signally damaged them. Yet his retirement from the leadership must be thought a misfortune for his party, which has in the House of Commons no man comparable to him all round. Lord Salisbury is inferior in everything except in an oratory which is more trenchant than convincing, and in an air of vigor which springs rather from recklessness than from courage.

THE VIENNA ANNIVERSARY.

The historical event of which Vienna celebrated yesterday the bicentenary anniversary is one of the very grandest landmarks in history. Christendom, as such, has had only two days of deliverance through the fiery ordeal of battle which can be compared with the 12th of September, 1683: the days of Poitiers and Lepanto. And the victory achieved by Charles Martel over the Saracens in 732 only hurled back the power of Islam beyond the Pyrenees; it left it in unimpaired vigor and dominant in every other field through which its prodigiously victorious course had carried it. The triumph of Don John of Austria over the fleet of the Sultan in 1571 stemmed the tide of Turkish aggression along the shores of the Mediterranean, but left the sword of the Janizaries unbroken, menacing, and ready for new conquests. It was the battle at the foot of the Kahlenberg which decided completely, and decided forever, the world's contest between the Cross and the Crescent. The crushing defeat of Kara Mustapha before the ramparts of Vienna not only delivered the imperial capital from impending ruin, Germany from terror, and Hungary virtually from the yoke of the Pashas: it doomed the whole structure of Ottoman military power to fatal decay. The offensive career of Islam in its deadly grapple with the Christian West ended on that memorable second Sunday of September. Turkish valor and Moslem fanaticism have since shown on hundreds of battle-fields—from Buda to Plevna—as bright as ever before, but the fights had become defensive, and as useless as obstinate. John Sobieski and the Duke of Lorraine struck wounds from which Turkey was nevermore to recover as a conquering Power.

At the opening of the year 1683 Mohammed IV. had the signal of war hoisted in Stambul, pointing in the direction of the Danube. Immense preparations were made. When the campaign opened, the Sultan accompanied his Grand Vizier, Kara Mustapha, to Belgrade, and gave him the holy banner of the Prophet. The army was drawn together at Eszék, on the Drave. It was joined by the Christian vassals of the Porte, the Prince of Transylvania, among others. It numbered from two to three hundred thousand combatants. The chief of the Hungarian malcontents, Emeric Tököly, on whom the Sultan had bestowed the royal dignity in Upper Hungary, led the way toward Vienna, as John Zápolya—like him a Magyar rival of a Hapsburg monarch—had done in 1529, when Solyman the Magnificent marched against the brother of Charles V. The Hungarians who served under the flag of the Emperor Leopold, as elected King, went over to Tököly, or evinced a worse than useless fidelity. The scanty Imperial troops withdrew before the invader without striking a blow. The Tartar horse spread devastation over immense tracts of land. The forces of Bavaria, Saxony, Würtemberg, and other States of the German Empire, summoned to succor the Emperor in this his greatest distress, gathered slowly, Brandenburg selfishly refused her aid, and the Imperial commander-in-chief, Charles of Lorraine, was distracted by calls for help from various quarters. Vienna awoke late to the peril which menaced her. Her defences had been neglected. For Leopold, threatened simultaneously by Mohammed IV. on the east and by Louis XIV., the Sultan's most Christian ally, on the west, had long hoped to buy off the former, and had subsequently too confidingly relied on an offensive alliance against the Turks concluded on March 31 with Sobieski, whose valiant hosts were now still far off. The Polish King, won over to the Imperial side mainly by the persuasion of his French consort, who had a personal grudge against Louis XIV., hesitated to begin a new campaign which the interests of his own country seemed to condemn, until Leopold's ambassador and the Pope's legate threw themselves upon their knees before him, the one crying, "Sire, save Vienna!" and the other adding, "Save Christendom!" In the beginning of July the Turks crossed the Austrian border, the Emperor fled, and on the 14th Kara Mustapha laid siege to Vienna, the suburbs of which were flaming from the torches of the Tartars. Tens of thousands of the villagers had been carried off into slavery.

Fortunately for Vienna, her defence was intrusted to Count Starhemberg, and the army that was to relieve her after the arrival of reinforcements was commanded by Duke Charles of Lorraine. No better man could have been found for either post. The fortifications of the capital were strengthened with a zeal and an alacrity such as only imminent peril and self-sacrificing patriotism could inspire. Sixty thousand inhabitants had fled at the approach of the foe; about an equal number remained, and of these about six thousand—burghers, students, workmen—shouldered arms for defence, all other able-bodied men working at the ramparts, palisades, and batteries. Charles had thrown 10,000 cavalry into the city, and with the bulk of his forces held the north bank of the Danube. The besiegers numbered about 180,000. Kara Mustapha was sure of his splendid prey, and desiring, it is believed, to get it intact, to the end avoided a general storm, which might have resulted in total destruction. But fierce fighting and assaulting, trenching and mining, went on incessantly, and before the end of two months the armed defenders were reduced by the sword and disease to less than half their number, and the Turks had lost nearly 50,000 men. Kara Mustapha failed to dislodge Charles—an attempt proved disastrous—to seize the crossing places of the Danube, and to occupy the heights of the Kahlenberg, between the Turkish camp and the river. The relieving forces gradually effected their junction. The Elector of Bavaria was among the first to arrive, the King of Poland came at the end of August, the Elector of Saxony a few days later. Among the many princely volunteers was Eugene of Savoy, then twenty years old. A council of war was held on September 3, and the advance on Vienna was determined on. King Sobieski had the chief command, but the Duke of Lorraine was the virtual leader.

On the 7th the united army was assembled at Tulln, on the south bank of the Danube, about twenty miles to the west of Vienna. It numbered about 75,000 men—20,000 Austrians, 30,000 troops of the Empire, and 25,000 Poles. On the 11th the Kahlenberg was occupied without resistance. The vast camp of the Grand Vizier now lay before the Christian hosts, and beyond it Vienna in her last extremity. On the morning of the 12th the offensive movement began. The Austrians and Saxons, forming the left wing and commanded by Charles, descended from the Kahlenberg, and, moving along the Danube, forced back the Turks who advanced to meet them, and, after bloody fighting, stormed their intrenched positions at Nussdorf and Heiligenstadt, north of the city. It was noon, and the victorious wing paused to allow the centre, consisting of Bavarians, Franconians, and Swabians, and the Poles on the right to come into line. The South-Germans and Poles advanced fighting—the latter as far as Dornbach—and the efforts of the Turks to check them proved vain. Kara Mustapha had left 30,000 men in the trenches before the city, who continued mining and storming while the battle raged; upward of 100,000 faced the wide semicircle of the Christians. Two charges of Sobieski's cavalry were repulsed; before the third the Turks withdrew to sheltering heights. It was now Charles of Lorraine's turn to move forward. His Saxons stormed a rampart armed with a battery, and the Austrians penetrated into the Turkish camp at Döbling, flanking the extreme right of the enemy. The flight of the besiegers began. Kara Mustapha, aroused from his quiet contemplation of the bright western sky, collected the bravest of his agas, displayed the banner of the Prophet, and prepared for the last combat. Sobieski attacked with all his cavalry, supported by German infantry and artillery, and, after a grapple of the fiercest kind, the Turks turned to flight. The Duke of Lorraine's troops had reached the ramparts before Vienna. The Janizaries, who had attempted a desperate storm of the city in the last hour, turned their guns against Charles, fired once more, and followed the fugitives. The sun had set. Twenty thousand Turkish corpses covered the battle-field. Vienna was delivered, Christendom triumphant.

It would be out of place here to speak of the tremendous amount of booty taken, of the Polish King's entry into the delivered capital on the following day, of the rapturous enthusiasm and gratitude of the Viennese, of the noble conduct of Charles of Lorraine toward the hero who had outstripped him in the race for the elective crown of Poland, of the stupid ingratitude of the Emperor Leopold, of the flight and pursuit into Hungary, of Kara Mustapha's death by order of his master, of Tököly's futile resistance, of Sobieski's return, of Charles's new triumphs. Our narrative closes with the day the anniversary of which Vienna, and with her Lemberg, Cracow, and other cities of Poland, celebrated yesterday. On the day of her deliverance Vienna hailed Sobieski, above all others, as her God-sent saviour. The streets, the churches, resounded with his name. The world's history, without forgetting the equally great merits of the heroic Starhemberg and the great Captain Charles, has entered that name most prominently in the proper page—fairly, we believe, for Sobieski came from a foreign country as a volunteer, and at the most critical moment, and was foremost by his rank, and command, and valor. Ninety years after the event Sobieski's fatherland was treacherously divided by her powerful neighbors, Russia, Prussia, and the empire of which Vienna was the capital, and the monarch a descendant of Leopold. A quarter of a century later Poland was divided once more, and the Hapsburgs took another share. The Poles became deadly enemies of Austria, and Dombrowski, Poniatowski, Bem, Dembinski, fought against her under French or Hungarian banners. Of late years, the aspect of things has changed again. Austria relies for her support on the Hungarian nation, whose independence Tököly, and after him Rákóczy and Kossuth, defended; and Austrian Poland—Galicia—is the only part of Sobieski's realm in which the Poles enjoy a free national existence. Russia prohibited the celebration of the day of Vienna within her dominions, from fear of its becoming a Polish demonstration in favor of Austria. In Prussian Poland the commemoration took place under severe restrictions. But Galicia glorified without stint the Polish King's fight before Vienna. Vienna herself, strange to say, prepared for the celebration in ill-humor, grumbling at the Poles for their late anti-German votes in the Reichsrath, depreciating the merits of Sobieski, and talking of *Polish* ingratitude.

THE SURVIVAL OF TYPES.

THE London *Daily News*, in the course of an article on what it calls "international reproaches," refers to the fact that there is much that is "traditional" in them. It thinks that both in America and in France the qualities and peculiarities attributed to English people are derived, to a great extent, less from experience than from inherited tradition. "We hear that Englishmen are rude to ladies; that they fail to yield them precedence at the ticket-offices of steamboats and railway stations; that they complain of everything that is given them as food; that they occupy more than their share of public conveyances with multitudinous wraps, sticks, and umbrellas. They assert themselves, it would seem, when they have placed 3,000 miles between themselves and their old home. There is, however, in all these complaints the ring of old coin." In the same way it says that the Parisian of the boulevards still believes the Englishman to be a creature who wears long red whiskers of the mutton-chop species, and wears a plaid—although, as a matter of fact, the typical Englishman of to-day does not look like this at all.

Any one interested in the matter might make a very queer collection of types which, having disappeared from actual life, survive in the popular imagination, and by surviving keep alive international prejudice, hostility, suspicion, or distrust, and which go on doing duty in this way for years and years, until suddenly some fine day it is discovered that they are out of date and must in future be dispensed with. There is, for instance, our old friend the stage Irishman. How often have our hearts been touched by the qualities of gratitude, devotion to sentiment, faithful friendship, and heroism of this noble creature. No doubt there must have been a time when he was as common in Ireland as he has been in our day in melodrama. But the Irishman, as he exists in New York and as he is described by those who have seen him at home, is strangely unlike the type. He is a decidedly practical, hard-headed man, with a keen eye to the main chance, a considerable fondness for fighting, and a disposition which we should call the reverse of sentimental. Harrigan and Hart represent the actual Irishman in America capitally at their little theatre in Broadway, yet the stage Irishman is to multitudes of Americans a more real creature than the actual Irishman, and we suppose there is hardly a Democratic statesman from one end of the country to the other who has not constantly before his mind an image of him by the contemplation of which he solves many of the knottiest problems of contemporary politics.

Then there is the Dundreary Englishman, first cousin or lineal descendant of the Englishman so dear to the French imagination. Dundreary really represents, as we know very well, when we think about it, a past type of swell

as extinct as the dodo. It is not common any longer for English swells to change all their *r*s into *w*s, and to spice their sentences with "aw-aws." We have numbers of them over here every year, but we do not hear them talk nowadays the once familiar Dundreary language. Yet there is hardly a newspaper in the United States whose funny man does not assume, for the benefit of his readers, that Dundreary is alive, and every now and then reproduce him with gusto. It is not in *Punch* that we find Dundreary, but in the funny department of the Oshkosh *Monitor* and the "All Sorts" column of the Bungtown *Clarion*. Even *Puck* contributes to perpetuate the belief in the continued existence of Dundreary by devoting a column a week to observations on American society in the Dundreary dialect, which thirty years ago might have been decidedly funny.

Punch still has John Bull as a national type; but it shows great reserve in the use of him, and now continually resorts to Britannia as a substitute. Is not this because our old friend John is now only a survival, a tradition of the past? The bluff, stout, honest, red-faced, irascible rural person—of whom the photographs of John Bright remind us—has really been supplanted by a more modern, thinner, nervous, intellectual, astute type. For English use the Yankee type of Uncle Sam still seems to represent America, although it belongs to the past as much as slavery or the stage-coach. He would be a bold man who should undertake to say what the national type is now; but it is safe to say that it is not a long, thin, 'cute Yankee, dressed in a swallow-tailed coat with brass buttons, whittling a stick and interlarding his conversation with "I swan!" and "I cal'late." If Mr. Lowell were writing the "Biglow Papers" now, would "Uncle S." serve his purpose as he did during the war? By a merciful dispensation of Providence, however, Brother Jonathan and Uncle Sam still live on in the imaginations of large masses of conservative Englishmen, and no doubt enable many a Tory to people the United States with a race as alien from that which actually inhabits it as Zulus would be.

In the same way it may be possible—to the Providence that guides the destinies of nations nothing is impossible—that the rude Englishman is, as the *Daily News* suggests, getting to be a survival. The *Daily News's* portrait of him is fair enough, though it would require Americans who have suffered from him to do him real justice. He is, or was, a very rude person, and always seemed to take great delight in "asserting himself" in such a way as to produce as much general annoyance and discomfort as possible. During the war he had a brilliant career. He used to come over and express great surprise at the silly fuss made about the Constitution and secession, and profess an entire inability to discover what it was "all about." If they want to go, he always said, why don't you let 'em go? What is the use of fighting about the meaning of a word in the dictionary? It was in small things as in great. When he went into society, he dressed to suit himself, and not as gentlemen in England or anywhere else do, thus contriving to exhibit a general contempt for his host and his friends. When his meek entertainer ventured to offer him some American dish which he did not like, he would frankly warn his companions against it, and if he asked for sugar in his coffee, he would in the same outspoken way explain that he always sweetened it "when it was bad." One of his favorite topics of conversation was the awful corruption and rottenness of American society and politics, and he dwelt so much upon this that it often seemed as if what he was really interested in was to find out whether the people he was staying with and being entertained by were not themselves, if the truth were known, rotten to the core.

He was a very rude man, and he did exist. But is he gone or going? Is the time coming when we shall have to regard him too as a survival, and admit that the rude Englishman is a creature of the past? Time and continued international experience can alone settle this question. There are, however, bitter memories of past sufferings at his hands in hundreds of American homes that make it better for both countries not to probe the subject too deeply.

THE ART REMAINS OF ATHENS.—I.

The modern town of Athens contains several places of deposit for works of ancient art. Some pieces of sculpture remain out-of-doors, more or less well sheltered and guarded. A few sculptures still remain in place, as in the Parthenon, or have been set up again after having been thrown down, as in the temple of the wingless Victory. So that Athens, not having as yet a well-organized museum, must be looked upon as itself a vast museum—one of the richest museums of sculpture in the world, and unrivalled in the department of sculpture in relief. The total amount of such sculpture is very great, and the average quality higher than that of any collection in Europe; and, indeed, London alone, enriched by the spoils of Athens itself, can compare with Athens in respect to average quality of ancient sculpture, and that in but a small collection, priceless as is its value. The great Continental galleries have their matchless masterpieces, but these are scattered and isolated among later imitative and inferior work. In Athens is no rubbish, such as fills furlongs of galleries in Italy and France; except a few Greco-Roman barbarisms from marble-yards of the epoch, all is pure Greek. What one sees is either of the Periclean epoch, or of the fascinating times of slow development before the Persian war, or of the splendid and glowing revival of the fourth century. And all this sculpture remains as it was found. The neat-looking statues that crowd the Vatican and the Louvre, such as have but a small nucleus that is antique and original—the limbs made anew by Renaissance or modern sculptors, and *perhaps* in their original attitudes; the head put on, and *perhaps* in its right position—all clean and bright, magnificent furniture, but of doubtful value for the study of the art of any special epoch: these are unknown in Athens. Shattered, mutilated, marked with the pick where hasty workmen have struck too hard through the superincumbent earth, laid on the floor, stood up against walls, defaced and discolored—at least all is original work of the Greek sculptor. The mind of the spectator can supply missing limbs, but cannot work so easily in despite of false limbs put in the place of the lost ones. Or, if the original state of the statue or bas-relief can only be conjectured, at least it is exquisite still as art: one hardly regrets what is lost in enjoyment of the fragment that remains.

The chief museum of Greece stands at the northern edge of the city of Athens, on the road which leads to the village of Patissia. It is by name the Central Museum (central to Greece, in a moral sense), but to cabmen and Athenians generally, the Patissia Museum rather. The building has been erected for its purpose. It is, as all museum buildings ought to be, one single story high, a *rez-de-chaussée* only. It has a front of two hundred and fifty feet, or thereabouts, toward the west, and, on entering in the middle of this front, one finds one's self in a lobby of thirty by forty feet, or thereabouts, paved with slabs of marble, walled with stucco, roofed with a simple vault, also plastered, and lighted by a row of plain windows high in the east wall, the whole severely plain—not a moulding, not a single architectural adornment. In the middle stands a colossal two-visaged Hermes; around the walls lie, stand, or lean perhaps forty pieces of sculpture of many epochs. The lobby is a sort of place of deposit for marbles which have not yet found a more fitting resting-place. There are interesting pieces among them, but perhaps no one is of importance enough to detain us, in our necessarily cursory examination.

Out of this lobby, southward, one enters three halls in succession; each is perhaps thirty feet by fifty, and is lighted by a row of windows high in the east wall—that is, in the end, and not the long side of the room. The first hall has also a sort of vestibule, which precedes it. Each room is as plain in style and finish as the lobby. To the north stretches a precisely similar row of rooms, but beyond these one enters a new wing containing much larger and longer halls; and as the length of this new building lies east and west, the windows are pierced in the north wall. It will be seen, then, that there are already built two sides of a considerable quadrangle; that the light is taken sometimes from the court within, and sometimes from without, as convenience dictates; that the lighting of each room is simple—that is, from one side only; that everything is in masonry, so that the building meets the only true definition of a fire-proof building—that is, a building in and about which there is nothing to burn; that there is only one floor and one level for all the rooms; and, finally, that not a drachma has been spent on ornamentation. This reads like a specification for an ideal building for a museum of sculpture. It is not my fault if a building built as cheaply as possible in a land where masonry is cheaper than wood work, and planned according to the most obvious dictates of common sense, serves better than royal or papal palace-halls, or than "Glyptotheks" built regardless of expense by dilettante kings.

Now, in the rooms to the south of the lobby are gathered the pieces of Romano-Greek, or late Greek, sculpture, and the visitor, forewarned, naturally turns northward, and, entering the vestibule leading to the first hall, finds himself among some delightful archaisms. Two statues, well known to students from published plates and descriptions, are from places not in Attica—the so-called Apollo of Thera in the island of Santorini (Sybel, 1; Milchhoefer, Saal I., a, 10), and the so-called Apollo of Orchomenos in Bœotia * (Sybel, 4; Milch., Saal I., a, 9). Each of these statues is without its legs to the knees, but is otherwise well preserved. They are generally

* The name of *Apollo*, it may be said once for all, as, indeed, Dr. Milchhoefer points out in his handbook, has been given almost as a matter of course to nude male statues which have no especial attributes; and this custom has been general until in the case of very recent discoveries.

assumed to be tombal statues. These two statues are not exactly unique, but they are important additions to the very small list of tolerably perfect pieces of good archaic work. In the same vestibule is a curious Romano-Egyptian statue of heroic size (Milch., Saal I., a, 22), an "Egyptian Antinous," if you like; but it has no business here, and should be sent across the lobby and into the Southern rooms, like a bit of sham archaism, as it is. These three statues are set up on plain marble pedestals, very sensibly, but the other pieces in this vestibule lie upon the floor or are propped against the wall. There are valuable things among them: a curious bearded Herakles carrying the Erymanthian boar (Sybel, 13; Milch., I., a, 3), much broken; but especially a high and narrow tomb-slab (Sybel, 8; Milch., I., a, 26), which has been frequently engraved. This is in gray Theban marble, and is sculptured with a life-size figure of an old man leaning on a staff, and holding out a cicada or other insect toward his dog, as if to tempt him to play. This was found at Rhomaiko in Bœotia, and was kept at Orchomenos for a while, from which place it is generally named. This is to be studied with the great sacred bas-relief from Eleusis in the second hall; they are important documents both, and our knowledge of this semi-pictorial sculpture of the time, shortly before the best epoch, when art was going on very rapidly toward its culmination, is founded upon these two pieces to a very great extent.

The first hall, into which we enter from the above-described vestibule, and of which that vestibule really forms a part, is filled with admirable monuments of sculpture, and is a most attractive room. The walls are lined all around with tomb-slabs, sculptured, some in low, some in very high relief; all large, some so large that the full-length figures upon them are of life-size. None larger or more elaborate are known, except two also in Athens, of which something must be said in their place. The smaller slabs are set up on two wooden screens placed end-on to the light. There are in this first hall sixty-five of these sculptured slabs, of all sizes; and, as few museums have any of these tombal slabs, and perhaps none out of Athens any large ones, it seems as if one at least should be described here. Many have inscriptions; but an unusually full and interesting inscription is that carved upon a slab under the windows, leaning against the east wall (Sybel, 69; Milch., Saal I., b, 9): "Here the earth covers the good and prudent Archestrate, sadly missed by her husband." This, in the original, is two lines of verse, carved upon a narrow architrave, for the slab is worked into a very simple architectural form—elongated pilasters, a narrow entablature of two divisions, and the semblance of a pediment with acroteria. The whole is just short of five feet high. The figures have much greater relief than the architectural frame. A woman of full age, but not old, sits on a decorative chair, facing the left; this is Archestrate, and her figure is nearly of life size. A servant standing in front of her presents a small box, and from it the lady's raised right hand is taking some piece of stuff. This maid-servant must be taken as only half-grown, as her head is on the level of the head of her seated mistress. A child behind its mother's knee, only its head and shoulders to be seen, tries to draw her attention to a bird which it holds. No part of the sculpture is worked up to perfection, and parts are curiously neglected, but the drapery is cast in the noblest way, and the head, the right arm in low relief, and the feet are admirably worked, and left just short of complete finish, as if by deliberate choice. There is nothing archaic about this relief: it is the swiftly and cheaply-done handiwork of a skilful workman of a great epoch. And yet this one, in merit, is below the average of the slabs in this room. At the opposite end are two which are above the average, which are quite *hors ligne;* they are put opposite the windows, and flat against the wall, but their very high relief makes this lighting from the front as harmless as if they were statues "in the round." These two (Sybel, 53; Milch., I., b, 24, and Sybel, 57; Milch., I., b, 20), both found in Athens, are almost the counterparts each of the other; it will suffice if one of them is described (Sybel, 57). It has two life-size figures. A magnificently muscular young man—not a coarse and tasteless caricature like the "Farnese Hercules," but a superb athlete, only a shade too much developed about the shoulders and back for perfect manly beauty—half sits, half leans upon a block or pillar. He turns toward his left, so that his right side is almost wholly disengaged from the background. A loose garment is thrown over his left fore-arm, and passes around behind him, forming a sort of cushion; he is otherwise undraped. From his wrist hangs a short, heavy, formidable, knotted club; behind his leg, and half seen, is a hound, with nose to ground. He may be read as a famous hunter, and his weapon as the Greek equivalent of the South African hurling-club for small game. A little attendant is curled up, and either asleep or weeping, on a low seat behind him. The other principal figure is a clothed and bearded elder, who stands, with right hand on chin, and the left leaning on a long staff, contemplating sadly the youth in front of him. There is no inscription, no architectural frame. The figures, and a perfectly simple shelf or floor upon which they stand, are relieved from a flat marble slab, and that is all, except that holes in the background near the heads seem to point to the former existence of bronze wreaths permanently attached to the heads. In each of these fine reliefs we may take the young man to be the regretted dead, and his companion to be the mourning father; but indeed the relation of the other personages present in all these grave-stone reliefs to the dead is uncertain. One curious difference in these two fine works of art, otherwise so like, is that the young man in the one we have described is wholly unconcerned and unconscious, and looks out from the marble, regardless of his companion, "wahrscheinlich bereits in heroisirter Existenz gedacht"; while in the other, the youth, with bowed head and hand on brows, seems almost to regret the separation.

In the middle of this room stands one of the few large separate statues which have been found in Greece (Sybel, 41; Milch., without number), the so-called Hermes of Atalanti (Talanda) in Bœotia. It has the lower parts of the legs supplied in plaster, and the hands, with what they once held, are much broken—the open socket showing where a part of one had been supplied in a separate piece of marble; otherwise it is perfect, and a fine, simple, manly piece of sculpture of heroic size. But in the next hall—which we will call, with the cataloguers, Hall II.—is a far superior work of art of the same sort, another nude statue of heroic size (Sybel, 264; Milch., II., 1), the admirable Hermes of Andros, found in 1833 in the island of that name. This figure is so like the famous Hermes, or Antinous, of the Vatican, that it may be called a *replica* of that noble statue, one of the half-dozen masterpieces of the first rank that Greece has left to us, in the way of free and separate statues.

The strength of the Athenian collections is evidently in bas-reliefs and other sculptures associated with buildings, or with a more or less decorative purpose. This is in no wise to be regretted; only it makes the few fine statues that are to be found there the more noteworthy. In this Hall II., besides the Hermes and the magnificent figure of a draped woman (Sybel, 265; Milch., II., 2) found at Andros together with the last named, and (but that it is headless, and so loses much interest and value) worthy to be associated with it, the chief attraction is found in the numerous small votive tablets and memorial tablets, all charged with sculpture, and many of them excellent as works of art. But as we shall find finer ones on the Acropolis, this subject may be left for the time. Another great thing in this room is the collection of funereal vases, their marble surfaces sculptured in very low relief, as comports with the curved and delicately-modelled forms. One huge lekythos (Sybel, 186), four feet six inches in height, in form closely copied from the graceful Attic earthenware vessels to which we give that name, bears the most delicate reliefs possible of a mounted youth and group of women on foot; but none of the others are at once so elaborate and so fine. There are three very curious statues of Sirens or Harpies in this hall (Sybel, 255, 256, 257), and on the floor an immense architectural coronal or terminal of a tomb set up to those who fell before Corinth, in the year 394 B. C. Of the heroes who fell in that expedition we shall hear more at the Street of Tombs, outside the ancient Eleusinian gate.

The hall beyond (III.) contains the small statue which was greeted with such an acclaim when found, in the heart of Athens, three years ago (too recently for a place in the catalogues, though Milchhoefer squeezes it into an appendix). As a copy in half life-size of the vast statue of Athena in the Parthenon, it has perhaps great documentary value, but it has little charm, little beauty by itself. The work is probably of the Roman time. A statue (Sybel, 274; Milch., III., 4), Hermes or Perseus, larger than life, and fine though not of the highest class; many votive bas-reliefs of great interest, and marble statuettes, all arranged on wooden screens; torsos and parts of statues laid on the floor along the walls, and two most admirable reliefs of draped dancing-women, in high relief and in good preservation, master-works of a time somewhat later than the best, fill this room, except that the immense "Eleusinian Relief" (Sybel, 314; Mich., III., 14), of which so much has been written, is put into the one place in the room where it cannot be seen—namely (as it is in very low relief and very much discolored), exactly opposite the windows. This measures five by seven feet, and is a perfectly simple bas-relief, the figures occupying the whole surface, so that they are much above life-size. It was found near the Propylæa of Eleusis, fifteen years ago, and may easily be identified by the archæological imagination with some interesting part of the mysterious Eleusinian Mysteries. Demeter and Kora, much larger than life, stand on the right and on the left, looking down upon a boyish figure who stands between them. Demeter or Korê (for here begin the diversities of interpretation, which is the mother and which the daughter) is giving to or receiving from the boy something—what? The object has been supplied in bronze, no doubt, and is now lost. If it was an ear of wheat, the boy is perhaps Triptolemus, the female to the left Demeter; but this interpretation, that one which calls the youth Bacchus, that one which takes him to be a prize-winner at the games, that one which makes him a specially devout servant of the "two great goddesses"—all have their upholders, and it is not now our business to defend theories of interpretation. The really admirable work of art, of a time just previous to the great epoch of Phidias and his school, is what we are interested in; and of this it must be said that a cast in a better exposure would give more enjoyment than the precious original in the

place where it is hidden in fulness of light. It is fortunate, by the way, that very good casts of all the more important Athenian marbles are to be had, without great delay or expense.

Now, passing out of the original building into the new north wing, we find ourselves in a hall, as devoid of ornament as all the others, ten paces wide, thirty-five paces long, well lighted from the north; and in this two long rows of marble statues, all lying on their backs. These have been moved hither since the new wing was finished, about two years ago; but no steps have as yet been taken to place them. One of them is a colossal Poseidon from the island of Melos, about which a good deal has been said. It is not at all a work of the highest quality. Of the many draped female statues, some are evidently of value; but let not the injustice be done any of them to criticise them where they lie. A recumbent statue is one thing; a statue made to stand erect, and laid temporarily upon the floor, is so out of place that we ought not to study or judge it. Its muscles do not relax; its forms do not adapt themselves to the strange position; it is a clumsy thing, because retaining what may be called its positive attitude under negative circumstances. So that, although something can be seen of the merit of a statue so placed, it will be more fair to leave judgment of these until that happy future day when this museum shall be arranged and, perhaps, catalogued.

When will that be? Perhaps not very soon. Years pass by, and sculptures which were laid in a corner five, seven, eight years ago, lie there still. Moreover, if the plan is actually adopted of completing the building of this Central Museum on the two remaining sides of the quadrangle, thus doubling its size; and if, as is gravely asserted by persons high in authority, no permanent disposition of the sculptures can be made until this is achieved, the twentieth century may find much the same state of things that exists to-day. There will be more works of art, no doubt, more fine pieces of sculpture, but the same inchoate condition of the collections. It is with no feeling of impatience that I express, what all lovers of art must feel, a profound regret at this state of things. Greece and the Greeks have had more than their share of abuse. The country is poor beyond the conception of people who know only rich and prosperous communities; with all the good-will in the world, there is *no* money to spare. Moreover, it has hitherto been an universal experience that, in a newly organized, half-developed, immature community, the shysters and knaves have more than their share of offices and of influence; perhaps the great United States have seen something of that. And when it is urged that Greece has had fifty years to shake off her swarm of vermin, and recover from the harm they do, the answer is twofold: Growth and development are but slow, politically, under such poor economic conditions, in such an absence of industry, commerce, and wealth; and, moreover, Greece had to begin again when the retrograde and benighted Bavarian régime came to an end only twenty years ago. With all deference for the opinions of those who know Greece long and well, I, who am but a passing visitor, busied only with carved stones, cannot join in blaming what I deplore, the forlorn condition of the museums of Athens.

There is but one thing which we, the outside world of students, have a right to ask of the Greeks: that they shall not allow their works of ancient art to be destroyed. The time will come when what then exists will be properly displayed; meantime let us ask, let us demand, let us insist upon one thing only—safe keeping. Let these statues lie upon their backs for ten years longer on the dry marble pavement; let the loveliest bas-reliefs in the world lean against walls, barely visible, in a bad light, if they must; but let them be guarded; let visitors' canes be kept away; let us entreat the Hellenic authorities to put a less feeble and worn-out race of *invalides* in charge, and prevent idle saunterers from rapping the marbles hard with the iron ferrules of their sticks, as one sees it done to-day. What we have of good old art is gradually being destroyed; all over Europe, neglect and "restoration," hand in hand, are all the while wiping out of existence what is most precious to us. In Greece every body, natives and foreigners, naturally thinks of exploration and excavation, and the adding to the stock of ancient sculptures, bronzes, terracottas, and the like. Very well; but first what is already above ground should be cared for. What we have should not be destroyed while we busy ourselves digging up more.

RUSSELL STURGIS.

THE IRISH FRANCHISE AND REGISTRATION QUESTION.

DUBLIN, August 25.

MR. HEALY, in the House of Commons on Thursday night, indulged in one of his fiery and detailed assaults upon the Government's position in Ireland: "From the day you first landed on our shores, 700 years ago, down to the 23d of August, 1883, you did nothing for the people that you could possibly abstain from doing." We may regard this as rhetoric; there is in it, however, a certain amount of truth. Nothing has been freely, and openly, and gladly conceded, as measures have been conceded to our British neighbors, and as they would be conceded by a Government dependent on and representative of the people. The rejection by the Lords of the Irish Registration Bill, the suppressed excitement this rejection has caused in Ireland, and the certainty that it will be a fertile cause of discussion during the recess, render it desirable we should have a clear conception of what the Irish franchise and registration question is.

If there is one right more than another that should be common to the inhabitants of all parts of the United Kingdom, it is the franchise. Irishmen are often called to account for not taking a genuine interest in the political questions which more especially agitate Great Britain, and which concern us as well. We always have felt that great reforms would be shorn of their benefits in their application to Ireland, and it was so in the case of the Reform Bill of 1867. The wide and general and hearty extension of the franchise to our fellow-subjects in the sister island was not accorded to us. A feeble protest was made by a few Irish members. But those were the days when we were "respectably" represented—when the men we sent over for the most part fell under the spell of British public opinion and the "tone" of the House. Ireland and its constituencies were far off. London, with its splendid privileges and enjoyments, was present. A green scarf and a little spread-eagle sunburstism would make matters all right at the next election. The Irish Franchise Bill was let pass, and the question has been an open sore ever since.

In the United States, as I take it, the vote centres in the man. In the United Kingdom it centres in the house, room, farm, estate, or chattel interest. Show me that you, A, B, and C, occupy the house, room, and farm, D, E, F, and you may have your votes. A blind beggar, unable to read and write, occupying a room worth a dollar a week, has a vote; while three wealthy college professors, living in common, would not have votes. If 1,000 men moved into the town X for a few years for a temporary purpose (say the construction of a great viaduct), the voting power of X would not be increased. It would probably be lessened, for some of the 1,000 would probably share rooms or houses with the voters, who would thereby lose their votes. We cannot have more than one vote in a town or district; but there is nothing to prevent our having votes, if we have property enough, in every town and county. Many rich men, therefore, have a busy time of it flying round at a general election; and the sheriffs, who fix the date of the elections, often fix them to convenience their friends. Most business men in cities have now two votes—one out of their business premises, another out of their residence. The only franchise at all like yours is the "freeman" franchise—an hereditary franchise held from old times. In England, in the large mass of voters, it counts for nothing, and is divided between Liberals and Conservatives. Here it is an essentially unfair franchise, held by Protestants. Out of the constituency of Dublin, 13,000, some 2,000 are "freemen." It is, in truth, difficult for a man here to know whether he has the franchise or not. Except in the case of freemen, the questions of residence and property and occupancy are complicated with involved considerations, interpreted differently by officials in different parts of the country, as to whether a man has paid certain rates and taxes, and when he has paid them.

The principal and really important franchise arises out of residential occupancy; and to give any clear idea in a short space of the differences between the franchise in Great Britain and Ireland we must confine ourselves to a consideration of the differences regarding the residential occupancy (or "rated occupier") franchises of the two countries. I shall have to quote figures as illustrating the net result of these differences. It must not be supposed the unfairness regarding Ireland is as great as appears from them. If the franchise were dependent upon general intelligence perhaps Ireland would be entitled thereto in full proportion to her population. As it depends upon residence and occupancy, and as there is more improvidence, poverty, and overcrowding apparent in Ireland—especially in the towns—than in Great Britain, we should not have as large a proportion of voters even under the fairest adjustment of the law.

In British boroughs all rated householders whose taxes have been paid are entitled to votes; also, by a late decision of the judges, nearly all lodgers will for the future be so entitled. In Irish boroughs only rated householders whose houses are valued by Government at over £4 per annum (equal to a yearly rental of about £8 in Ireland, or £10 or £12 in England), and lodgers paying 4s. per week or over are entitled to votes. Irish boroughs have less than half as many Parliamentary voters in proportion to population as British boroughs. There has been no change since Mr. Butt's time in the relative proportions of population to alter the suggestiveness of a return he obtained upon this subject. Leeds, with a population of 259,200, had 43,800 electors; Dublin, with 267,700, had 12,800; Swansea, with 80,800, had 12,500 electors; Cork, with 100,500, had 4,400; Wolverhampton, with 157,000, had 23,300 electors; Belfast, with 174,400, had 15,000; Stafford, with 16,000, had 3,400 electors; Kilkenny, with 15,800, had 700 electors, and so on.

In English and Irish counties the occupier's franchise is nominally the same, a £12 Government valuation; but, from a difference in the method of valuing and other causes, English counties have more than one and a-half times as many voters in proportion to population as

Irish. In England the valuation, both in boroughs and counties, is based upon the rental, whereas in Ireland it is generally some 33 per cent. or more under the letting value. I hold two houses, the valuation of both of which is but 50 per cent. of the letting value. This valuation question is only spoken of under the breath in Ireland, as its regulation and consequent increase would add to the amount of our income tax. It will be thus understood that in Great Britain a farmer paying £12 rent finds his land valued at £12 for letting purposes and has the franchise, while here such a man would be rated at but £9 in Ireland, and would be excluded from a voice in the election of his Parliamentary representative. Taking boroughs and counties together, two men out of five have votes in Great Britain, while only one man in five has the same in Ireland. Again, illustrating the position by figures from Mr. Butt's return, Eastern Sussex, with a population of 139,600, had 10,000 electors; Dublin County, with 140,500, had 4,400; East Yorkshire, with 140,600, had 11,000 electors; Limerick, with 141,500, had 6,500; Cheshire, with 349,000, had 23,200; Cork, with 396,600, had 16,200; Gloucestershire, with 251,400, had 20,800 electors; Down, with 263,800, had 11,500.

In England every person, *male and female*, who has occupied for twelve months any house rated for poor relief, is entitled to the municipal franchise. In Ireland every *man* only, who has occupied a house rated at the value of £10 (equal to a rental of some £18 in Ireland or £24 in England) is so entitled. English towns have from four to nine times as many voters, for municipal purposes, as Irish towns. Leeds, with a population of 259,200, had 52,800 municipal electors; Dublin, with 246,300 (the municipal is not the same as the Parliamentary population), had 5,600; Bradford, with 245,800, had 29,500 voters; Belfast, with 174,400, had 5,500; Swansea, with 80,800, had 8,700 voters; Cork, with 78,600, had 2,000; Gateshead, with 48,300, had 10,300 voters; Limerick, with 39,800, had 1,100.

The present inequalities have existed for fifteen years. The Government has made no real move to reform them, and has given no effective assistance to the Irish members, who have pressed them again and again upon Parliament. Such disabilities scarcely tend to sweeten the character and bearing of the Irish people and those who represent them, or to render them enthusiastic supporters of the British Constitution. Delay inevitably complicates reform. In 1867, when even-handed justice might fairly have been done, there was no "Irish Parliamentary party." Now, it would perhaps be hard to expect the Ministry to feel very enthusiastic about strengthening the hands of those who are their opponents.

So much for the letter of the Irish franchise; now for a glance at some of the additional disabilities which the Registration Bill just thrown out by the Lords was intended to redress. The Government have twice brought in this Registration Bill, and it has been twice rejected by the Upper House. It is nevertheless maintained by the National party that the Government have never shown any real earnestness in the matter —such earnestness and determination as they have always shown in relation to repressive measures for Ireland. Nor have they taken any trouble to secure the attendance of a sufficient number of their followers in the Upper House. There are 490 Peers; the Ministry can command a majority upon all important occasions, or they could not carry on the work of the country. The Registration Bill was defeated the other day by 52 Conservatives to 32 supporters of the Government. In other words, but 32 hereditary legislators cared to support a measure declared by Mr. Gladstone and Mr. Trevelyan to be a necessary measure of justice to Ireland.

Every precaution is taken that the British voter shall have his vote. Here it is not so. In all cases the burthen of objection is thrown upon the objector. (1.) In Ireland no reason need be assigned. The objections can be sent out at a cost of but threepence each (six cents), and if the voters do not attend at the Revision Court they are disfranchised. They are seldom granted any compensation for loss of time in meeting frivolous objections. I have lived in the county of Dublin for eighteen years—nine years in one house, nine years in another. I pay my taxes regularly. I have, I believe, never yet had the vote. Each year I have received an "objection paper" from one or other party (often from both parties). Each year I have not had the time to devote one or more days to attendance at the Revision Court. Consequently my name, while retained for all *obligations*, such as jury-serving, is for all *rights* erased. Poor, hardworking voters in districts remote from the revision centre are swept off by the hundred. The organization on the Conservative and landlord side is, as it has generally been, complete and vigilant. Their friends are those who can best afford to attend and sustain their votes, and humbler voters are often deterred from appearing through the fear of giving offence to landlords, agents, and officials. Some unexpected and dire misfortune to the National party is upon the cards at the next revision in consequence of the vigor with which the weapon of "objection" is now being worked. (2.) By one legal quibble, apart from objections, some 5,000 men are disfranchised in Dublin. (3.) In Great Britain there is a penalty of £2 on the proper officer for omitting a name from the registry; in Ireland there is no such provision, and the officers are generally under the influence of and friendly to the Conservative party. (4.) In Great Britain the owners of property are bound under heavy penalties to return to the overseers the names of their tenants entitled to vote. In Ireland there is no such provision. (5.) In England the overseers are bound under a penalty to send notice to a man that unless he pays his taxes by a particular day he will be disfranchised. In Ireland there is no such provision. (6.) In England every inducement, as much in some cases as 15 to 20 per cent. reduction, is held out to owners to pay the rates necessary to entitle occupiers to the franchise. In Ireland there is no such provision. In the richer country a bonus is given to induce men to avail themselves of their right; in the poorer country every obstacle is thrown in the way of those who are desirous of exercising it. (7.) In Great Britain the revising barrister in every town over 10,000 inhabitants must hold an evening sitting for the convenience of persons employed during the day. In Ireland there is no such provision.

There is no defence for these anomalous differences. In Great Britain every householder, man or woman, has the municipal franchise, and every male householder can, in the words of Chief-Justice Holt, "vote for a member of Parliament, who has the power to bind both his person and his property." The people of Ireland enjoy no such privilege; they for the most part stand outside the pale of the Constitution. I cannot better conclude this somewhat dry and perhaps uninteresting communication than in the words of the London *Times*, printed many years ago: "Of all the enterprises on which legislative and administrative time can be wasted, the most useless, except in exceptional circumstances, is that of attacking secret societies. The only way to counterbalance them is to open to men in the ordinary institutions of the country the means of obtaining all the political objects they can reasonably desire." Mr. Gladstone has, as I have said, intimated that the Registration Bill, or one more inclusive, will be reintroduced next session. Let us hope that the question of the assimilation of the Irish and British franchise will likewise be dealt with.

D. B.

Correspondence.

GREEK AND ENGLISH.

To the Editor of The Nation:

Sir: As a contribution to the recently-revived discussion of the value of Greek in our educational curriculum, the following *facts* are submitted for what they are worth: Our city high school has three parallel courses of study extending through four years, and known as the "English," "Latin-English," and "classical," only the latter including Greek as a regular study. At the graduation of each class a medal is awarded for the best English essay upon a subject assigned by the faculty, and several "honorable mentions" are made of others approaching in merit the prize essay. All the graduates are obliged to compete. The awarding of these honors is usually made by a committee of college professors. The report on the essays of the last class was signed by President Porter, of Yale College.

The records of the school show that in the last ten years (1874–1883) the graduates of the "classical" divisions have averaged *twenty* per cent. of the entire classes, while they have taken nearly *thirty four* per cent. of the honors (medals and "honorable mentions" combined), and *sixty* per cent. of the medals alone. The mathematics in the three courses is virtually the same. The scholars in the English course study rhetoric one year, and those of both the English and Latin-English study English literature one year, mental science one year, and political economy and moral science each one semester. The members of the classical division are of necessity deprived of all these last-mentioned studies, and take Greek in their stead during three years. In the comparison of teachers, I should say the English and Latin-English have the advantage. I submit that, à priori, the graduates in the two last-named courses ought to be better fitted for writing English composition than those who have given their attention mainly to Greek in place of these eminently "practical" English studies; but the foregoing figures, if they have any bearing on the subject, do not confirm this opinion. These facts seem to me all the more important, in view of the statement so often reiterated, that "time is spent on *Greek* to the great detriment of learning to think and express one's thoughts in good English." R.

Albany, Sept. 6, 1883.

PRESIDENT PORTER ON THE STUDY OF ANGLO-SAXON.

To the Editor of The Nation:

Sir: Doubtless many of us who are interested in college matters turned with great eagerness to see what President Porter, in the *Princeton Review* for September, had to say about Mr. Adams's recent address, "A College Fetich." We certainly got some information. We learned that Mr. Adams, as well as his "hesitating" predecessor, "the adventurous and sanguine President of Harvard College," was sadly astray in his views about the place of Greek in a college curriculum. We learned, too, that Soft Electives are a Serbonian Bog, and that the whole elective system is full of "fatal temptations."

But not on account of all these things did I, for one, go away sorrowful. On page 127 President Porter is very stern against those who are "foremost to reduce the study of Greek to an elective branch, and to treat it as a select and rare form of intellectual culture, like Quaternions or Anglo-Saxon or Icelandic. . . ." Undesigned testimony, we know, is the best testimony. President Porter testifies that he considers the study of the early forms of our own language and of the splendid beginnings of our literature just as needless for the general student as the study of Quaternions or Icelandic. What light this may throw on President Porter's ability to discuss fairly and liberally the general question of college studies, is not for me to say; but it will be permitted me to express a little anxiety for the future of the Early English Text Society.

FRANCIS B. GUMMERE.

MT. DESERT AND ITS FREQUENTERS.

TO THE EDITOR OF THE NATION:

SIR: The letter in the *Nation* of August 23 from a "Boarder" at Bar Harbor is a valuable addition to my own, because it enumerates the things needful to be done there which I had not space to mention in detail. Still, a fuller acquaintance with the history of the place and of the present condition of things would have prevented the reflections upon the course of the Selectmen. Any one who knows where the work began fifteen years ago, rather admires what has been accomplished than wonders at what is still wanting. In nothing has the task been harder than in the matter of roads, for, with the single exception of the old post road between the Narrows and Southwest Harbor, every road on the island has been built within that time, or so completely made over as to amount to new. The shore roads are, as the "Boarder" suggests, absolutely indispensable if the island is to be a great resort; but nowhere and upon no point is the influence of the Cottager so powerful and so fatal as upon this. Certainly the road to the Ovens ought to be built, but the plan for the small piece of it from Duck Brook to Hull's Cove, constructed last spring, cost a three-years' struggle, and was at last carried only at the point of the bayonet. It was the Cottager, present and prospective, who fought most bitterly against it. No one knows better than the Selectmen of Eden (I speak advisedly) what would be the gain of a road from Great Head to Otter Cliffs, but it would cost all the town was worth twelve years ago. The road along the west shore of the island must be built by the towns of Mt. Desert and Tremont. They are poor. Much of the shore is already in the hands of speculators. None of the three towns has yet accumulated anything. It has taken all that the summer has brought to do what they have already done.

Such, in brief, are the reasons why outside help, as I said before, has become necessary—outside help, directly, in actual money from the merchants and the corporations that have interests there, and then, indirectly but even more powerfully, in the moral help which may come from a public opinion that will duly value the shore, and will condemn any selfishly exclusive enjoyment of it.

A. R.

SOUTHERN HOMICIDE.

TO THE EDITOR OF THE NATION:

SIR: Our community has just been sorely "shocked" by the assassination of an estimable citizen of this county. He had been tried some months ago for an assault with intent to murder, and had been acquitted. Prudential motives, however, had detained him away from home until recently. He returned a few weeks since and resumed his business. One day, shortly after his return, he was found dead in the road near his house. A post-mortem examination disclosed the fact that he was fired at from the roadside with a gun loaded with buckshot and mortally wounded; that while his victim lay dying, the assassin approached and fired five pistol-balls into the body to make sure of his work. This occurred at Le Grand, a station on the Montgomery Southern Railway, twelve miles from this point. The murder is of a much more deliberate sort than those common in the South, but the murderous spirit so plain in this instance is none the less present in "the heated encounters" we hear so much of in this section.

The rationale of Southern homicide is, it seems, very far from being satisfactorily determined. The *Nation* has been more successful in demolishing all attacks made upon its criticism than in explaining why there should be an occasion for its criticism. The Cavalier theory of the origin of Southern fondness for homicide may be rejected as useless. According to that theory, never did a little leaven leaven so mighty a mass before. Consider the case made out against the South, that, among all classes of people there, life is frequently taken under circumstances that excite the horror and wonder of civilized communities elsewhere: why do not Southerners feel the same horror and wonder at Southern murders?

The man who was suspected of the murder referred to above had his preliminary trial in this place. The trial was attended by a crowd of witnesses from the neighborhood where the crime was committed, but to the citizens of Montgomery (the writer included) the trial of the suspected man has been of little interest. The dead man lived in this county, and was known here; the writer knew him personally. We have all gone our ways. I sit down to write the *Nation* how little we care about the murder.

This indifference to life is due, I am strongly persuaded, to the effects of slavery. This would be difficult to prove, and will recommend itself differently to different minds as an explanation. It is an easy application of the method of difference to say slavery has made the best Southern people indifferent to life. Because it has an easy application, however, is one reason why we are likely to overlook its value to us in this instance. Slavery enveloped and controlled the growth of the South until a few years since. This is a large fact—so large that, when an estimable citizen is shot down by another estimable citizen, we must run to their English ancestry, that was perhaps Scotch, perhaps French, for an explanation of the murder. Why neglect the leading characteristic of the South? Slavery was the South. If politics partook of the definiteness of religion, and we were able to speak with the exactitude of a theologian in discussing social life, a Southern political catechism might be easily written. It might follow the Westminster and ask, "Who made you?" The answer from the young political student would be, "Slavery." If, like the Westminster also, it attempted prophecy, and, unlike that, allowed change, and should contain another question, "Who will make you over again?" the answer would be, "The slave."

The student who seeks an answer to Southern problems ought first to assure himself of the influence of slavery. When he has weighed this and found it small in any instance, then he will be right in seeking for other determining causes. In the two following considerations he will, I think, get near a solution of the enigma of Southern homicide: first, the latent anarchy of the Southern slave system, verging as it did upon war, and the consequent disregard of life among all classes; second, the widely-dispersed nature of settlement at the South, that caused every planter to set the bounds to his own passions. Every Southerner was a sort of Italian republic within himself. Like the modern Jingo, also, he sought peace with honor, and he warred to get it. I leave to a more skilful hand than mine the task of reconciling the fierce Germanic spirit of independence in the Southerner with his strong subservience to the opinion of his neighbor. Or is all this too likely to be, with our passion for life-taking, a thing of the past, because the product of a past? The practice of shooting at sight will continue, we may be sure, for many years yet at the South. The disappearance of the practice will be thought as certain to be, at a sooner or a later day, as we put great or little trust in the beneficent action of the social forces of our time. These forces are now pouring into the veins of the old South. The *Nation* deserves our gratitude for beginning and encouraging a rational discussion of a topic that is important to the whole Union.

Very respectfully, THOS. H. CLARK.

MONTGOMERY, ALA., Sept. 8, 1883.

A LAST WORD ON McMASTER'S HISTORY.

TO THE EDITOR OF THE NATION:

SIR: Your issue of September 6 contains a letter from "Editor of *Book Notes*" in regard to McMaster's 'History.' I am content to leave readers to judge, from his own statement of his case, whether his criticisms are microscopic; but, in simple justice to Mr. McMaster, I must ask space enough in the *Nation* to complete a citation made by "Editor," and to add what he has omitted in order to make out a prima-facie case.

He cites from page 339 of McMaster's 'History,' italicising to suit his purpose, stops just at the point beyond which he did not venture to go, and then comments as follows:

"Now, I maintain that the impression upon the reader's mind is, all through, that this proposed law was a real law; that for a time the people labored under it; and that, at a subsequent meeting of the Legislature, it was repealed: all of which is untrue, and no part of the history of Rhode Island."

As a comment on his commentary, let me complete his citation from the point at which he stops:

"In this form the law went before the people. Town meetings were immediately called to discuss it; but the partisans of the bank had, by their own violence, inflicted a deep injury upon their cause. Many honest and fair-minded men, who were prepared to welcome with delight the appearance of a paper currency, were not prepared to vote for the bill. They believed that the new money would lighten many burdens. To them, taking the oath would be a small matter; but they shrank from the thought of giving their assent to a law that forbade men of a different mind to sail their ships, to cast their votes, to practise their professions, to hold any office of public trust, till they had come before an officer of the law, and, stammering and stuttering from shame, called their Maker to witness that they would do a thing they thought to be both foolish and wicked. There was also some fear of a great exodus. It seemed likely that a number of rich merchants and prosperous tradesmen would, before submitting to so degrading an act, pack up their goods, desert their homes, and set off for a neighboring State. Everywhere the oath was denounced in the strongest terms; and when the returns were all in, it was found that but three towns had given an assenting vote. At North Kingston, Scituate, and Forster, those who approved so far outnumbered those who opposed the bill that the delegates were instructed to support it in the Legislature. Their support was of no use. In November the Test Act was thrown out by an overwhelming majority."

By adding this to the extract given by "Editor" last week, any reader is competent to decide on

whom rests the burden of the *suppressio veri*. I do not feel that I should be justified in asking the *Nation* for any more space on this point.

J.

NORWALK, CONN., Sept. 7, 1883.

GEN. CROOK AND THE APACHES.

TO THE EDITOR OF THE NATION:

SIR: In your issue of August 16, a correspondent, "F. E. R.," makes the statement that "the value of General Crook's campaign among the Apaches in Mexico seems to me to have been overestimated. A great personal triumph over natural obstacles has been so exaggerated in importance that it appears as a public benefit." He then gives several reasons—which, it is fair to presume, seem to him to be sufficient—"why the capture of the Apaches General Crook brought in was not of the value which has been given to it."

The first reason assigned by your correspondent is the fact that the Apaches, "when he [General Crook] came up with them, were anxious to be on the San Carlos reservation, . . . because they realized [this he takes from General Crook's statements] that they were no longer able to make a successful stand against the whites." Your correspondent adds: "How the Indians arrived at this conclusion, or what past experience they had on which to base it, we are not told"; and, in the absence of the necessary information, he assumes that these Apaches *had gone out* from the San Carlos reservation, and desired to return to it to recruit for future raids.

I ask the privilege of your valuable space to supply, however imperfectly, the missing information. In the first place, the above is an unfair statement, and one calculated to convey the impression that General Crook toiled over the rocks into the heart of the Sierra Madre in the character of a peace commissioner, anxious for "the transfer of a band of murderers from a place of discomfort and danger to a city of refuge." It omits to state that a few hours, or days, before the Apaches sent in runners asking to be taken to the San Carlos reservation (not to *return* to it, please observe, for many, if not the greater part, of them were the "incorrigibles"—men never before on a reservation), General Crook had struck them the "quick, hard blow these Indians deserved"—a killing blow, as any one familiar with these Indians will understand, because it *destroyed their confidence in their strongholds*, and showed them that General Crook, with whose reputation they are perfectly acquainted and whom they *fear* (I make this statement based upon three years' close observation of the Arizona Apaches), had at last been able to break through the obstacle of a national boundary-line, the importance of which as a means of defence the Indians perfectly understood, and that their particular time for punishment had arrived. Here we have a good reason why the Indians were anxious for peace: they were whipped. The actual number of killed in the fight was of little importance; the dread of General Crook's methods of Indian fighting had come home to them, and they will not forget it. All the soldiers who worked and suffered—"died daily," so to speak—under the privations and hardships of General Crook's Apache campaigns from 1871 to 1875, will understand perfectly the exact effect and importance of his latest success. These men can remember how the Arivaypa Apaches were driven out of their stronghold in the Pinal Mountains, and sued for a peace which they have kept; how the Tonto Apaches were hunted, with incredible toil, through the Mazatzal Mountains and over the "Black Mesa" until they submitted; and how the name of Crook became a perfect terror to the Apache Indians of Arizona. I respectfully submit that "F. E. R." is greatly in error if he supposes that General Crook allowed these Indians to come in without satisfactory proof that they were subdued; and I trust I may be pardoned if I add that the judgment of a man who is feared by all the Indians of Arizona, and respected because he never broke his word to them, is of more value than that of the gentleman who innocently remarks that the "anxiety" (of the Indians) "to be on the reservation may be accounted for by remembering that during April, May, and June in southern Arizona . . . the grass is poor and the game not desirable." Evidently "F. E. R." is unaware of the fact that the Apaches are foot-soldiers, mountain-climbers, dependent only upon their sturdy legs for transportation, and that they subsist for months on the vegetable mescal to be found on every hillside.

In regard to the question of adequate punishment for these Indians, I am sorry that "F. E. R." has a "feeling of shame" for our frontier soldiers, because, in his opinion, they "have failed to strike the quick, hard blows these Indians deserved"; but I am comforted by the thought that he probably knows as little about what they have done as he does of the nature and habits of the Apaches. Otherwise, I am sure, he would find no ground for shame.

The Indian question is not to be settled in a few lines of newspaper correspondence, but I venture to say that any punishment inflicted on the Indians in a spirit of *revenge* is unworthy of a civilized nation. If, therefore, these Apaches were subdued, and would remain peaceable, for which I am willing to accept General Crook's judgment, it was entirely in accordance with all precedents to make peace with them. To punish the individuals for acts committed by the tribe, and for which all are guilty, is simply to declare a war of extermination. J. B. B.

FORT ROBINSON, NEBRASKA, Sept. 1, 1883.

ITALIAN UNFRIENDLINESS TO SILVER.

TO THE EDITOR OF THE NATION:

SIR: We have, in Italy, been under the régime of a mixed silver and gold coinage, brought down to par after several years of irredeemable paper circulation, but silver is generally avoided and paper preferred to it for anything above a two-franc piece. Our postmaster apologized to me yesterday for giving me two five-franc pieces in change, as he had no paper, and the landlady of a hotel at which I lunched two or three days ago apologized for giving me gold in change for a fifty-franc note, as she found it impossible to get small notes enough to satisfy the demand, though she could have silver by the sack if she wanted it. The five-franc piece is shunned by everybody, except now and then an Englishman new to the country.

This is evidently an indication of the fate of silver if forced into circulation under the double standard. There will be a revolt against it if the tender is made substantial and practical.

W.

FLORENCE, August 23, 1883.

Notes.

BESIDES a new and uniform edition of the works of Donald G. Mitchell ("Ik Marvel"), already announced, Charles Scribner's Sons will soon begin publication of a collection of 'English Verse,' edited by W. J. Linton and R. H. Stoddard, in five volumes 16mo. These will be respectively divided into Chaucer to Burns, Lyrics of the Nineteenth Century, Ballads and Romances, Dramatic Selections, Translations. Purity of text will be one of the special aims of the editors. Mr. Stoddard will furnish an introduction to each volume, and there will be an abundance of brief notices, biographical and other. The same publishers announce 'Music in England and America,' by Dr. F. L. Ritter, an historical survey; 'Historical Handbook of Italian Sculpture,' by Charles C. Perkins; 'Mrs. Gilpin's Frugalities,' by Miss Susan A. Brown, showing how to use up remnants in the kitchen; 'Biblical Study,' by Prof. Charles A. Briggs; 'The Doctrine of Sacred Scripture,' by Prof. Geo. T. Ladd; and the following works by foreign authors: Prof. J. S. Blackie's 'The Wisdom of Goethe'; Prof. Julius Köstlin's 'Life of Martin Luther'; and Moritz Busch's 'Our Chancellor,' or Bismarck in private life, his religious views, etc.

Doyle & Whittle, Boston, will reprint in one volume, illustrated, 'Newfoundland: its History, Present Condition, and Future Prospects,' by Joseph Hatton and the Rev. M. Harvey.

J. B. Lippincott & Co., in connection with Smith, Elder & Co., of London, have in preparation a new edition of Thackeray's works, which will be published in twenty-six volumes 8vo. In this "Standard Edition" will be included some of Thackeray's writings which have not before been collected, with many additional illustrations. New type and fine paper will make this, with the exception of the *édition de luxe*, the largest and handsomest edition that has been published. The first volume, containing 'Vanity Fair,' vol. i., with a portrait of the author, twenty-one steel plates and eighty-four wood engravings, will be published early in October, and a new volume each succeeding month until the conclusion of the series.

Jansen, McClurg & Co., Chicago, will publish 'Round about Rio,' by F. D. Y. Carpenter, being a year's experience of an American family in Brazil; and 'Political Recollections, from 1840 to 1872,' by Geo. W. Julian.

'Dulce Domum,' poems by Benjamin F. Taylor; 'World Life, or Comparative Geology,' by Prof. Alexander Winchell; and F. W. Horn's 'History of the Literature of the Scandinavian North,' translated by Prof. R. B. Anderson, with a very full bibliography of important books in English relating to Scandinavia, by Thorvald Solberg, are in the press of S. C. Griggs & Co., Chicago.

The late Mr. Edward Fitzgerald, best known as the translator of Omar Khayyâm, has left behind him several pieces which have hitherto been circulated only among his personal friends. These will now be collected and published, probably with others of his works which are less accessible, and the whole will be accompanied by a selection from his letters, should there be sufficient material for the purpose. If there are any of Mr. Fitzgerald's correspondents who have preserved his letters, they are invited to communicate with his literary executor, Mr. Aldis Wright, Trinity College, Cambridge, England.

Mr. Henry Irving will make a book as well as a tour of this country, and already promises 'Impressions of America,' to be published immediately on his return. Mr. Joseph Hatton, we are told, has in hand a biography of this actor.

The announcement made by not a few newspapers that M. Coquelin, the great comedian of the Théâtre-Français, was about to publish his reminiscences of Gambetta, of whom he was one of the closest personal friends, is premature. The book is not only not ready for the press, but, we understand, the first line of it has not been written. M. Coquelin is making notes now and then for the book; but he intends waiting at least a year or two, until the temper of Gambetta's enemies and political opponents has had

time to cool off, before he publishes his tribute to his friend's memory. He desires to dwell more particularly on Gambetta's unusual gifts as a critic of art and of literature, and on the extraordinary facility with which he assimilated all that was best in contemporary thought. The book, when it does appear, will not be large—no larger, indeed, than the comedian's other books, in one of which, by the way, the lecture on the poetry of M. Eugène Manuel, he took occasion to make an outline sketch of Gambetta. M. Coquelin has now in press a lecture on 'L'Art de dire le Monologue,' in which he incidentally discusses the ever debatable question as to the proper delivery of verse on the stage. This little essay ought to be as instructive and as entertaining as that other on 'L'Art du Comédien,' of which there is an American translation. 'L'Art de dire le Monologue' will have a supplement by M. Coquelin's brother, the most famous comic monologuist of Paris, in which the more farcical and extravagantly humorous side of the question will be treated at length.

Some two years ago, in No. 835 of the *Nation*, we reviewed at length M. Louis Gonse's life of that interesting man and artist, Eugène Fromentin. This work has now been translated by Mary Caroline Robbins, and published with the portrait and facsimiles of sketches which accompanied the original ('E. Fromentin, Painter and Writer,' Boston: J. R. Osgood & Co.). The book is beautifully printed.

A general welcome will be extended to the "Handbook Dictionary" (English-French-German) by George F. Chambers, of which the American publishers are G. P. Putnam's Sons. The arrangement is in parallel columns; the selection of English words and phrases has strict reference to every-day usefulness in conversation; the memory is allowed to be burdened with but a single equivalent for the required idea in the three languages; the gender, finally, of nouns is manifested typographically to the eye, as *Faculté* (fem.), DÉFAUT (masc.) MISSLINGEN (neut.). All this has been carried out with great pains and intelligence, after vivavoce discussions of every word (as the compiler assures us) with Frenchmen and Germans. Compactness is attained by avoiding repetitions or cross-references. For example, "keep dry" is placed under *Dry* and not also under *Keep*. But this will cause but little trouble. Two pages are devoted to *Go* and the versatile *Get* respectively. We miss the handy phrases "all right," "help (me) out," "have done!" in the sense of cease; "out of mind," though the other half of the proverb is given; "out of sorts," "out of patience," "out of luck," and a few other trifles.

A real advance in social science is the establishment of schools for the selection and instruction of nurses. In this country nearly all the efficient work in that direction has been done within the past ten years, but now the trained nurse has become a recognized and important factor in the care of the seriously sick. The schools are generally practical ones, in connection with the larger hospitals, where both patients and facilities for caring for them abound; and as great care is taken in the selection of the pupils, the field is being occupied by young women of a good order of intelligence and character. Dr. W. G. Thompson, of this city, who has had personal knowledge of the working of one of the best of these schools, has published an account of what has been done at home and abroad up to date, with special reference to their organization ('Training Schools for Nurses': G. P. Putnam's Sons). His little book is useful to those contemplating the occupation and to those desiring aid, and it is interesting to the general reader. Both Boston and Philadelphia excel New York in having a central Directory, a sort of exchange, where trained nurses can be secured without delay, and where the nurses can make themselves known without unpleasant advertising. Such a Directory is more than a convenience: it is a public benefit. In New York, at present, chance and favor do more than system to secure help in an emergency.

A so called Centennial Edition of 'Irving's Life of Washington' has been got out in quarto form, in two parts, with paper covers, by G. P. Putnam's Sons. It is illustrated with woodcuts, and is well calculated for wide popular favor.

Harper & Bros. have published a new edition of R. D. Blackmore's 'Lorna Doone,' and have added to their Franklin Square Library 'The New Timothy' of the late Rev. William M. Baker.

The Society of the Cincinnati receives, apropos of the centennial celebration of its founding, especial attention in the September number of the *Magazine of American History*. Gen. John Cochrane's article is not much more, however, than an excuse for some very interesting portraits of Presidents and members of the Society.

No. 3 of vol. ix. of the Proceedings of the U. S. Naval Institute is wholly given up to a paper on 'The Development of Armor for Naval Use,' by Lieut. E. W. Very, U. S. N.

A kindred subject is treated in the latest publication of the Board of Engineers for Fortifications: 'The Fortifications of To-day' (Washington: Government Printing-Office), which consists of translations from the German and the Italian on fire against models of coast batteries and parados; and on horizontal and curved fire in defence of coasts.

An illustrated paper at Cincinnati, called the *Week*, and a *Commercial Traveller's Magazine*, also illustrated, published in this city, are among the novelties in periodical literature.

At last the 'Almanach des Spectacles' for 1882 has made its appearance, with an etching by M. Lalauze of Mlle. Bartet, of the Comédie-Française. The typography of the little volume is as delightful as ever. The two other French theatrical annuals have also appeared—M. Mortier's 'Soirées Parisiennes,' with a striking preface by M. Becque and a cover reproducing a picture of M. Clairin's recently exhibited in New York; and the 'Annales du Théâtre et de la Musique,' with a highly-interesting preface on *mise-en-scène* by M. Émile Perrin, the manager of the Théâtre-Français.

The formation of an American Ornithologists' Union, in accordance with a late prospectus, is now assured. The first convention will be held in the lecture-room of the American Museum of Natural History, in this city, on Wednesday, Sept. 26, at 11 A. M.

—The Board of Regents of the University of Michigan have recently published a reply to the Memorial of the Philological Association and of the Association for the Advancement of Science, in regard to the matter of conferring the degree of Ph.D. *honoris causa*. The subject was referred by the Regents to a committee, consisting of President Angell and Professors Frieze and Adams; and the Report of that Committee is published as the answer to the Memorial. The Report takes the ground that the memorialists are in error in saying that "in Germany the degree of Doctor of Philosophy is as much a professional degree as that in Theology, Law, or Medicine," and cites in proof a letter received by the Committee from Professor Roth, as well as the words on the same subject in the work on German Higher Education by M. Edmond Dreyfus-Brisac. Use is made of the table given by the French author, showing that at the University of Bonn, one of the most exacting of the German universities in regard to degrees, the degree of Ph.D. in the last sixteen years has been conferred 760 times on examination, and 105 times *honoris causa*. In a single year the honorary degree was conferred by that one university on eighteen persons. In view of these facts it is claimed by the Committee that the argument of the memorialists, so far as it rests upon German precedent and custom, falls to the ground. Unless the authorities quoted by the Committee are sadly at fault, the custom in Germany in regard to honorary degrees is identical with that of our own best institutions. The Committee deplore the frequency with which honorary degrees have been conferred by many of our colleges, but they are of the opinion that the University of Michigan has been particularly chary in the bestowal of its academic honors. In conclusion the Committee recommend no change in the policy of the university. In short, because others have been and perhaps still are intemperate in the matter of degrees, they see no reason for a policy of total abstinence on their own part.

—We noted in our last volume the existence of the custom of breaking a straw in ratification of a bargain in India, in Rome, in Germany, and in England. M. Gaidoz has pointed out, in the *Revue de l'Histoire des Religions*, a much greater extension of the practice of driving nails into idols when offering a prayer. The object is to call the attention of the god; the prayer being thought to penetrate his mind as the metal penetrates his body—indeed, to the primitive savage the distinction between idol and god, between body and mind, must have been very vague or non-existent. It is so still in children, and we fancy in more men than is ordinarily supposed. Be that as it may, the nail rite which is practised in Congo had its parallel in the most sacred solemnities of republican Rome. On great occasions, when the state was in danger, during a pestilence, during an epidemic of poisoning, a dictator was appointed *clavi figendi causa*. He did not drive the nail into the image—a stone image could not be pierced—but into the walls of the temple. The Roman rite is in its second stage: there has been a "substitution"; but it is in intention and at the bottom the same as the African. What is the common cause of the two? Is it historical or psychological? is it transmission or human nature? If it is derivation from a common stock, what is the source from which Rome and Congo have alike sprung? If it is communication from savage tribe to savage tribe, when was it made, and what was the link between two such different races? If it was neither of these causes, but only the inevitable result of the primitive efforts at prayer, how are we ever to argue a community of origin from a community of superstition, and what profit for the history of races is the laborious study of legends? Rome and Congo were not the only practisers of nail-prayer. In France it has survived till recently in connection with a survival of tree-worship. A great oak near Angers was covered with nails to the height of almost ten feet. At Vienna is the *Stock im Eisen*, a trunk which is a mere cuirass of nail-heads. And travellers report the nailing of sacred trees in Persia. Then there are various derivations of the rite, in which it appears with a changed significance or a modified practice. The Protestants in Montbéliard used, within a generation, to make marriages secure by driving a nail into the pulpit. In Brittany, girls who want a husband within a year push a pin into the wooden statue of a Spanish saint (St. Uferier). If the pin bends, the husband will be deformed. In another part of the country St. Quirec is treated in the same way, and in another parish

St. Christopher. If the pin does not go in at the first trial, the marriage will not take place within the year. When the statue is of stone, substitution is made as at Rome: the pins are put round it; and when the object to which the prayer is addressed is not an idol but a fountain or spring, the pins are thrown into it. There is some distance between a dictator driving a nail into the wall of a temple on the Capitoline Hill and a peasant girl throwing a pin into a brook in a French village, but there can be no doubt that their acts have the same origin and the same purpose—to call the attention of a supernatural power.

—Much ink was spilt a few years ago over a psycho-philological question regarding the development of the color sense in man. One party, represented by Gladstone, Geiger, and Magnus, claimed that our color-sense is of comparatively recent origin. The vagueness and apparent confusion in the use of color-epithets in Homeric and other early writings led them to believe that within historic times green, blue, and violet did not exist for our ancestors, while, further back, even the first two colors of the spectrum, red and yellow, would seem to disappear from literary records. This startling theory, however, was met by such solid and stubborn facts that those who were at first inclined to accept it as being possibly in accordance with modern notions of development, soon saw themselves obliged to abandon it. Mr. Grant Allen, in his work on the color-sense, presented evidence, based on special experiments, which showed that savages in all parts of the world have absolutely the same color sense as we have; and, as Evolution accepts the modern savage as the representative of our remote ancestors, it is hence inferred that the latter could not have been differently constituted. Mr. Allen also pointed out that all the principal colors are employed for decorative purposes by the ancient Indians, Egyptians, etc., and must therefore have been discriminated by these peoples at a time when these theorists suppose them to have been totally or partly color-blind. In an article published in *Macmillan's Magazine* for December, 1879, it was shown that even as far down in the scale as the monkey the retina has all the microscopic color elements which distinguish the human retina; and the apparent anomaly of ancient chromatic nomenclature was explained as being due to a want of æsthetic, and not of physical or physiological, development of the color-sense. But Herr Magnus has not yet, apparently, had all his doubts set at rest. In No. 420 of Virchow and Holtzendorff's 'Wissenschaftliche Vorträge,' just issued (Berlin: Carl Habel), he returns to the attack in a somewhat modified and surreptitious form. He admits that "we must not imagine that in those early phases of development mankind was in an optical condition analogous to our modern notion of color-blindness." The experiments on savages under his own direction, conducted on a somewhat different and more certain method than Grant Allen's, led to identical results, and he is forced to admit that, "hitherto at least, not a single tribe has been found lacking the power of perceiving any one of the principal colors" of the spectrum. Other anomalous phenomena, however, were discovered which are of the greatest interest. It was found everywhere that red and yellow are distinguished by name long before the more subdued colors at the other end of the spectrum representing the shorter waves—blue, green, and violet. Many primitive nations virtually divide colors into three groups: (1) red, including all nuances to yellow; (2) light, including all bright (intense) nuances of the different colors, except red; (3) dark, including all subdued nuances of the most different colors. In other words, the quantity of the light seems to be regarded earlier than its quality or color. Again, it has been shown that green and blue are much more difficult to recognize at a distance than red, and many Europeans at the present day, who are not really color-blind, are puzzled when they are asked to classify properly certain shades of blue, green, or violet. Finally, Professor Preyer's experiments on the perception of color by a child brought out the fact that in the second and the first half of the third year of its life there is an apparent insensibility to green and blue, while red and yellow are readily distinguished.

—All these things seem to point to a gradual evolution of the color-sense from the red to the violet end of the spectrum, and Doctor Magnus endeavors to show that the nomenclature everywhere keeps pace in specialization and definiteness with this physiological progress in perception. But his argument is hazy in regard to the real point at issue. Professor Preyer had no means of showing that his child could not physiologically discriminate between blue and green, but only that it showed *indifference* to those colors, while red and yellow, being more glaring and "loud," attracted its attention sooner. Very suggestive in this connection is an observation which Doctor Virchow made while experimenting on the color-sense of a band of Nubians in Berlin. At first they displayed hesitation and confusion as soon as they got beyond the red, but when the colored objects placed before them were enlarged their difficulties at once vanished. From this we may safely make the general inference that the retina of savages and children has all the anatomical elements of color-perception fully developed, but some of them are in a dormant state due to a lack of exercise—the result of *æsthetic indifference*. Blue, green, and violet are less glaring and more refined and æsthetic than red and yellow, and hence not as readily appreciated. If Doctor Magnus had taken the trouble to consult the article in *Macmillan's* already referred to, he might have saved himself the task of writing the present pamphlet. There has been, apparently, an æsthetic but not a physiological development of the color-sense within historic times, and parallel with this a development of a corresponding terminology. We find analogous phenomena in the sphere of the other senses—for example, in the sense of hearing. Many musical pupils with normal physiological development of the auditory apparatus are unable at first to distinguish between the minute fractions of a tone on which correct intonation is dependent; but æsthetic culture, by training the attention, very soon enables them to sing correctly in tune.

—To a perhaps not large class of readers the late Ivan Turgeneff stood for the greatest novelist of our day. No one, certainly, to whom the Russian is a sealed language, can exactly appreciate his genius. Of his diction, for example, we may be said to know nothing. The only quality which translations (speaking of prose works) cannot disguise is length, and in this respect we know that he stood at the other end of the line, say, from Thackeray or the author of 'Middlemarch.' On this account, and for the just measure of his brevity, it seems to some of us that Turgeneff was an artist in a sense that cannot be affirmed of his long-winded contemporaries, and that he will continue to be read with pleasure after a busy world has placed them on the shelf among the idols whose greatness is undisputed, though the worshippers have deserted their altars. We cannot possibly, again, estimate the value of his formal poetry, any more than a Russian could assign its rank to George Eliot's verse; but, on the other hand, we cannot mistake the poetry which suffuses his stories, and in particular that subtle and delicious blending of the landscape with human moods and passions in which what writer has ever excelled him? It would be superfluous to dwell on the rare loveliness of his female characters. They are a sure and honorable index of his esteem for that sex, and through them we are attracted as powerfully as in any other way to the author's personality. Here, at least, there can be no room for difference of opinion: Ivan Turgeneff had in him a noble and humane blood. Nor can there be any question of his patriotism. He shared this to the full with his sterling kinsman and fellow-exile Nicholas Turgeneff, the Russian abolitionist *par excellence*, the friend of Stein. To read the works of either without loving him was, we must believe, impossible for any man of sensibility.

—It is strange that, in a country where so much is thought of documentary evidence for history as in France, so little care should be given to the preservation of public archives; but so it is. The Ministry of Foreign Affairs has, indeed, after a good deal of complaint, organized its archives on a basis which insures their preservation and yet a sufficiently free use by scholars. But the archives of the War Office are almost entirely closed to workers, and the archives of the Navy Department are apparently open without restriction to pilferers. M. Flammermont has urged very strongly the preparation of inventories, which would reveal what treasures these archives now possess, and, if an examination was made from time to time, would render any dilapidations evident, and show where precautionary measures were needed. The same proposition was made some time ago, and the work was begun; but one of the numerous changes of Ministry threw the direction of affairs into other hands, and officialism prevailed. Why the persons in charge of the archives should be so opposed to inventories as they are is not evident, unless they want to steal without check themselves. Certain it is that in this country no library in the East, and of late years few large libraries in the West, think it possible to dispense with exact shelf-lists, as they are called. The annual "all present or accounted for" of the books recorded on these lists corresponds to the annual auditing of a treasurer's accounts, and is as useful to the librarians in protecting them against rash accusations of carelessness or dishonesty, as it is to the ruling boards in preventing those faults.

MISS FERRIER'S NOVELS.

Miss Ferrier's Novels. London: Richard Bentley & Son.

MESSRS. BENTLEY & SON have done well to republish Miss Ferrier's works: her novels are, in more ways than one, well worth careful perusal. Yet we doubt whether they will greatly interest the general reader. They are, indeed, the production of an author gifted with considerable talent; but a critic feels almost instinctively that no writer of half Miss Ferrier's cleverness would write nowadays as she did fifty or sixty years ago, and that an unknown author who should now repeat the style of 'Marriage' or 'Inheritance' would not find a publisher. The question which perplexes us as we study Miss Ferrier's pages is, What is the precise change which has come over novels and novel-readers during the last half-century? What is it which makes Miss Ferrier's humor and good sense seem so thoroughly antiquated and out of date? The inquiry deserves some consideration. It can, we believe, be answered only by frankly acknow-

ledging that, both in literary skill and in a quality which may be called thoughtfulness, the present generation have made a considerable advance beyond the point occupied by their fathers.

Take, first, the matter of literary skill. Miss Ferrier was, in point of natural ability, far above the average novel-writer of to-day. We doubt whether at the present moment there exists in England any living authoress (unless it be Mrs. Oliphant or Mrs. Thackeray Ritchie) who stands, in acuteness, in humor, in insight into character, much above the writer of 'Inheritance.' We shall not do Miss Ferrier injustice if we place her only a little below Miss Austen in point of humor, and Miss Edgeworth in point of wit and sterling sense. But high as we are inclined to put Miss Ferrier among the female novelists of England, we admit at once that she exhibits a want of literary skill which would hardly be betrayed by any one among the number of authors whose works are to be read in every month's magazine, and are forgotten before the month is out. What writer, for example, of any ability would now fill his pages with descriptions or reflections such as these?

"It rarely happens that one artificial mind can succeed in forming another. We rarely imitate what we do not love. There is something in human nature which recoils from an artificial character even more than from a faulty one; and where the attempt fails, the revulsion generally produces a character of a totally different stamp. Mrs. St. Clair had spared no pains to render her daughter as great an adept in dissimilation as she was herself, but all her endeavors had proved unsuccessful, and Miss St. Clair remained pretty much as nature had formed her—a mixture of wheat and tares, flowers and weeds."

Now, can any one believe that Mrs. Oliphant, or any author occupying in 1883 anything like the position held by Miss Ferrier among the writers of her time, would write in the style of the sentence we have quoted about a heroine intended to interest the public? The merest bungler would know that this way of ticketing Gertrude's characteristics would weary the reader, and that Miss St. Clair ought to be allowed to speak for herself and display her character by her words and acts. He would also perceive (though here we touch upon a somewhat different point) that the attempted analysis of the young lady's disposition was utterly wanting in the kind of subtlety required by critics who have been used to the fine discrimination between different shades of feeling and sentiment which abounds, say, in even the poorest of Mr. Trollope's novels. Every candid judge must admit that Miss Ferrier, as compared with her contemporaries, occupied, and deserved to occupy, a higher rank than can be claimed for Miss Yonge in the literary world of to-day. But any unprejudiced judge must also admit that Miss Yonge would never dream of opening a tale with the crude and platitudinous reflections which we have cited from the early chapters of 'Inheritance.'

Nothing, again, can be more absolutely inartistic than Miss Ferrier's plots. The plot of 'Inheritance' is supplied by the Douglas case, but the book would have been far better if, as in 'Marriage,' Miss Ferrier had dropped all ideas of mystery and dramatic complication. A reader must be inexperienced indeed in the world of romance who does not soon perceive that Gertrude is not the heiress, or who feels that the interest of 'Inheritance' is in the least degree increased by the very thin veil of mystery flung over Gertrude's parentage. The point of the novel is to be found in its pictures of character. But even as a painter of character Miss Ferrier at once betrays the want of literary skill which would be fatal to the success of a modern novelist. All her best portraits are at bottom humorous delineations, not of human beings, but of certain oddities which in real life make up only a very small portion of that very complex thing which we call a character. Every one of her personages is merely the embodiment of some one quality. What any one among her *dramatis personæ* is during the first scene in which we make his acquaintance, that, and nothing else, he continues to the end of the story. Lord Rossville, for example, is the incarnation of foolish pompcsity and family pride. To exhibit ludicrous solemnity and an absurd overestimate of his birth and pedigree, is the part assigned to his lordship. He is never for a moment allowed to forget this duty: he is always pompous; he is always inane; he is always alluding to his ancestors. Miss Pratt—by far the most humorous, by the way, of Miss Ferrier's creations—is the fussy, unabashed, irrepressible bore. Never for one minute is she allowed to be anything but a bore. There is, moreover, but little variety in the mode in which this lady tortures her victims. On all occasions, appropriate and inappropriate, she alludes to her nephew, Anthony Whyte, and repeats, in season and out of season, the dreary witticisms of the terrible Anthony. This passage gives Miss Pratt quite at her best or her worst:

"'But you are not so ill to please as Anthony Whyte. That was really a good thing Lord Punmedown said to him that night. Looking at the two Miss Blacks, says he to Anthony, with a shake of his head: "Ah, Anthony," says he, "I'm afraid two Blacks will never make a White!" Ha! ha! ha! Lord Rossville, did you hear that? At the Circuit ball Lord Punmedown said to Anthony Whyte, pointing to the two Miss Blacks, "I fear," says he, "two Blacks will never make a White." "No, my lord," says Anthony; "for you know there's no turning a Blackamoor white!" Ha! ha! ha! "A very *fair* answer," says my Lord. Lady Millbank, did you hear of Lord Punmedown's attack upon Mr. Whyte at the ball? The two Miss Blacks—'

"'I black-ball a repetition of that *bon-mot*,' said Colonel Delmour.

"'You will really be taken for a magpie, if you are so black and white,' said Miss Millbank.

"''Pon my word, that's not at all amiss. I must let Anthony Whyte hear that.'"

The quotation is a little long, but it is worth study, not so much for the picture of Miss Pratt as for the idea it gives us of Miss Ferrier. She can paint Miss Pratt's oddities with a good deal of vivacity, but she can do nothing more. Miss Pratt repeats a score of times precisely the kind of remarks—we might almost say the very remarks themselves—which she makes the first time we meet her at Lord Rossville's dinner-table. We are at first amused, we are next bored by Miss Pratt, and we begin at last to be bored by Miss Pratt's creator. And what is true of Miss Pratt is, as we have already pointed out, true of every one among Miss Ferrier's literary creations. She exaggerates and satirizes an idiosyncrasy, and fancies she has analyzed a character. She is, in other words, utterly deficient in the literary skill requisite for so blending different qualities together as to form out of them the picture of a living man or woman. Fancy Mrs. Gaskell dealing with the most insignificant of the personages in her novels after the manner in which Miss Ferrier deals with a character like that of Miss Pratt, on which she obviously expended an immense amount of care and even of imagination. Yet it would be unfair to suppose that Miss Ferrier did not in point of talent stand very much on a level with the authoress of 'Mary Barton' and of 'Wives and Daughters.' The difference between Miss Ferrier and Mrs. Gaskell measures the immense advance in literary capacity made by English writers during the last fifty years.

Turn, now, to the matter of thoughtfulness. You cannot read a chapter of Miss Ferrier's stories without seeing that the world in which she moved and for which she wrote—that is to say, the world of educated English gentlemen and English ladies—was in her day far less cultivated both in width and in subtlety of thought than is the same world in 1883. There is something oppressive in the narrowness of ideas and of interests to be found in the persons who are painted for us in Miss Ferrier's pages. The authoress herself was clearly a person of real feeling; but the sketches of life which she has produced are sketches of a generation who for the most part were utterly uninterested in the moral, the religious, the social, or political questions which, for good or bad, do in matter of fact employ the minds, or at any rate arouse the attention, of the educated men and women of modern England. We see, indeed, slight (though very slight) traces in Miss Ferrier's novels of interest in, or perhaps even sympathy with, what would now be called the Evangelical movement. There are unmistakable signs that English society was beginning to perceive that Miss Austen's respectable but entirely non-religious clergymen, and the doctrine they may be supposed to have taught, did not meet the spiritual wants of the time. But of all the varied interests which occupy the thoughts and often harass the conscience of the heroes or heroines introduced to us by Miss Yonge or Mr. Trollope, there is not a trace to be found in Miss Ferrier's narrative or in Miss Ferrier's reflections. 'Middlemarch' and a good number of the 'Scenes of Clerical Life' are meant to paint England at about the time when Miss Ferrier lived and wrote; yet George Eliot's genius did not enable her to keep quite true to the spirit of the period about which she wrote. The wider interests and more complicated sentiments of the age in which George Eliot composed her works give the picture of English country life in the last generation a coloring very different from the dull hue given it by one who, like Miss Ferrier, drew not from recollections of the past, but from her actual knowledge of what was then the present. The effort to impress upon the reader how narrow was the horizon within which were limited the views of the society in whose midst was passed the tragedy of Maggie Tulliver's life does not, after all, impress a critic with half that sense of narrowness which is conveyed quite unconsciously by Miss Ferrier's description of her own time. Any of Mr. Trollope's heroines—say, the lady whose changes of mind interest or disgust the readers of 'Can You Forgive Her?'—would feel suffocated could she be transplanted back into the atmosphere breathed, and breathed happily, by her grandmother.

For, after all, there is no reason to suppose that the young gentlemen and young ladies of fifty years ago enjoyed life less than their descendants. They enjoyed it, however, if Miss Ferrier be (as we doubt not she is) a truthful witness, in a very different way. For good or bad, the Gertrudes, the Marys, or the Bellas whom she has painted or satirized are blessed or cursed with an absence of thoughtfulness which would shock the least intelligent of that very dull family, the Mays, whose sayings and doings are recorded in volume after volume by Miss Yonge.

"We are never long so totally abstracted by our own feelings as to be unconscious of the attempts of others to please us. In Alicia, to be conscious of it and to be grateful was the same movement. Yet she was sensible that so many persons could not in that short period have become seriously interested in her. The observation did not escape her how much an English stranger is looked up to for fashion and taste in Edinburgh, though possessing little merit save that of being English; yet she felt gratified and

thankful for the kindness and attention that greeted her appearance on all sides."

Any modern boy or girl out of the nursery would laugh or yawn at this kind of platitudinous reflection, and no writer who knew her trade would describe the thoughts, say, of Ethel May in the manner in which Miss Ferrier describes the observations of Alicia. If we want, however, fully to realize the increased thoughtfulness of the present day as compared with the England of half a century ago, we should do well to study Miss Ferrier's fools. There are a good number of them. She was clearly a lady who had a keen eye for the absurdities of her neighbors. But the thing which strikes any modern reader is the extraordinary simplicity of the follies which Miss Ferrier satirizes. Take, for instance, Lady Juliana. The first moment we meet her she is thus described when addressed (with the monstrous pomposity characteristic of Miss Ferrier's noblemen) by her father, the Earl of Courtland, on the subject of her ladyship's marriage: "Lady Juliana rang for the footman to take Venus, bade Pluto be quiet like a darling under the sofa, and, taking Cupid in her arms, assured his lordship he need fear no disturbance from the sweet creatures, and that she would be all attention to his commands—kissing her cherished pug as she spoke." This is her ladyship at her first entrance. She continues the same to the end of the drama. At every turn she shows a simplicity of folly which would nowadays be just possible in a spoilt child of eleven or twelve, but could hardly be found in any young woman who had entered her teens. We venture to say that there is not a fool of the quality of Lady Juliana to be found from the beginning to the end of all Trollope's voluminous works; and Trollope shows in this his usual knowledge of his time. Fools we shall always have with us, but folly itself gains, at any rate, in complexity with the progress of civilization. Lady Juliana is no more a picture of the modern young lady than Tony Lumpkin represents the modern young squire.

The wickedness, moreover, of Miss Ferrier's world is marked by the same simplicity as is its folly. There are as many men now as there were fifty years ago ready to throw over a girl to whom they are engaged on finding that, instead of being an heiress of high birth, she is the penniless daughter of a vulgar father. But there are few gentlemen of Colonel Delmour's position who would rid themselves of a girl like Gertrude with the simple, undisguised selfishness and blackguardism displayed by Colonel Delmour. Gertrude herself is quite as simple in her manner of going wrong as is her lover. She is an excellent girl while in the country. She goes up to London; she at once forgets all her good habits, all her old friends, and all her praiseworthy resolutions. The funny thing is, not that a young lady should be heartless, but that she should show so little art in hiding her failings.

Miss Ferrier's heroes and heroines, in short, in their goodness, in their folly, in their wickedness, exhibit a simplicity of character quite foreign to the Englishmen or Englishwomen personally known to George Eliot, to Trollope, or to Mrs. Gaskell. Nor is it hard to see what are the main causes of this change. A good deal is due to the different movements—religious, moral, or social—which, during the last fifty years, have roused English society from a condition of placid, if somewhat dull, contentment to a state of interesting, though perhaps morbid, excitement about matters which hardly occupied the minds of its grandfathers or grandmothers. But the main cause is, after all, the existence and influence of the school founded by Miss Austen and Miss Ferrier. These ladies, and others like them, brought into vogue the novels which illustrate and analyze all the affairs of ordinary life. Novelists have done far more to educate the English world than have schoolmasters or governesses. The young persons who have grown up within the last twenty or thirty years have been accustomed to hear from their true teachers — Trollope, George Eliot, Miss Yonge, or Thackeray—about a host of matters which were all but unknown to the audience addressed by Miss Ferrier. They have also learnt from their teachers how interesting it is to think about one's own life, one's own duties, and one's own character. The stupidest young woman of one's acquaintance can now make reflections about herself which would have astonished Miss Ferrier's heroines and Miss Ferrier by their profundity and subtlety. Whether the world has gained much in happiness or in goodness from the teachers who have at last taught us all, if not to "know ourselves," at any rate to think about ourselves, may be left as an open question. The point which can be an open question to no one who studies Miss Ferrier's novels with intelligence is that she and her followers have produced a great result. They have imbued the whole of the present generation with that mysterious quality which, according to our estimate of its worth, we call self-consciousness or thoughtfulness.

NAVAL OPERATIONS IN THE GULF.

The Gulf and Inland Waters. By A. T. Mahan, Com. U. S. N. [The Navy in the Civil War.] Charles Scribner's Sons. 1883.

THIS volume deals principally with the service of the navy at Mobile, and on the Mississippi and its tributaries. Nowhere else in the war did the army and navy act together in more cordial and efficient concert. Instances of this may easily be multiplied. On the bloody field of Pittsburg Landing two gunboats prevented our left from being cut off from its base on the river till Buell's advance under General Nelson, himself a naval officer, restored the doubtful fortunes of the day. On the other hand, General Banks's army, under the skilful guidance of General Bailey, dammed the Red River and saved Admiral Porter's fleet from being stranded in the heart of the enemy's country. The history of the war, also, on no other theatre shows in a clearer light the importance of the part the navy played in the contest.

For river duty a fleet was hastily created of ironclads, massive and torpid, like the turtles from which they took their nickname; of river boats altered to rams; of mortar rafts and tinclads. Nondescript crews were put in each of these without any naval officer but the commander. The whole grew up under Captain A. H. Foote, a man of remarkable qualities, whose death early in the war deprived him of exceptional honors. Its first success of consequence was at Fort Henry, where General Grant also was first brought into notice. The orders for the expedition against Fort Henry and Fort Donelson were given late in January, 1862, by General Halleck to General Grant, who immediately started up the Tennessee River with 17,000 men on transports convoyed by Flag-Officer Foote with four armored and three wooden gunboats. More ships would have been brought but for want of men, and all the crews in Cairo were brought but one. The plan was for a combined attack by land and water. Heavy rains, however, delayed the troops. They also swept down many torpedoes, which were towed ashore by the wooden gunboats. The flag-officer, having waited in vain for the army, about noon of February 6 attacked alone. As usual, he formed his ironclads in line abreast, advancing steadily as he fired till he was within six hundred yards of the fort. The wooden gunboats were in a second line astern on the right. After an action of an hour and a quarter the Confederate flag was hauled down, and the fort and garrison surrendered to the navy. The greater part of the men, however, escaped to Fort Donelson. Seven of the twelve active guns in the fort were disabled. The casualties on both sides were moderate, two-thirds of those in the ships being from scalding.

The flag-officer, against his judgment, but at the urgent request of Generals Halleck and Grant, made an attempt on Fort Donelson on February 14. As before, he formed his three ironclads in line abreast, with the three wooden gunboats in rear to fire over them, and advanced firing to within four hundred yards of the batteries. After a hot action of an hour and a half, two of his ironclads were disabled and drifted out of action, and the other boats were obliged to withdraw from the unequal contest. Three of the four pilots received mortal wounds. Here, as everywhere else on the river, this class of men, taken from their peaceful daily business, showed a gallantry and steadiness of courage surpassed by those of no other set of men in the war. The flag-officer was standing by his pilot when he was killed, and was himself wounded in the arm and leg by splinters. The latter wound never healed, and, aggravated by mental strain and the climate, forced him three months later to give up his command, and finally hastened his end. On the 16th Buckner surrendered the post to General Grant, after the responsibility had been shirked in turn by Floyd and Pillow.

These victories had a wide sweep: the Confederate line was broken. General Johnston at once turned southwards, to take up a new line extending from Fort Pillow or Memphis on the left through Corinth to Chattanooga, abandoning Nashville. General Pope, advancing on the right bank of the Mississippi River, took New Madrid, and went to work on a canal by which transports could come into the river south of Island No. 10, which was strongly held. Attack, in fact, was hopeless from the north, and the situation was very analogous to that at Vicksburg the next year. Early in April the canal was passable, and troops could cross the river if the navy could protect them. For this it was necessary that some gunboats should run the batteries. It must be remembered that this was then an untried experiment. It was some weeks before Captain Farragut had begun his brilliant career by passing the lower forts at New Orleans. Moreover, he was able by the size of his fleet to distract and scatter the fire of the guns on land, and he had the advantage of attacking up-stream. Foote referred the question to his commanders, and all but one said the attempt was hopeless. He overruled their opinion, and assigned the venture to Commander Walke, the only one who showed confidence in the scheme. It was one of the most gallant decisions of the war, most gallantly carried out. The *Carondelet*, unaided, braved the concentrated force of the long line of guns. Every precaution had been taken to save her from harm. Her vulnerable parts were covered with lumber, cordwood, and chain cables; her escape-steam was turned into the wheel-house to conceal its puffing; the pilot-house was wrapped eighteen inches thick with a hawser; a hay-barge was made fast to her quarter to protect the magazine; the guns were run in and the ports closed; no lights were allowed to show. All her men, fully armed, stood ready to repel boarders, only two men being on deck. Soon after 10 P. M. of April 4, just as a violent thunder-storm broke, she swung from her moorings and started down-

stream. The night was very dark; the flashes of lightning and of the enemy's guns just sufficed for the pilot to keep the channel. Before 1 A. M. she was safe at New Madrid. On the night of the 6th the *Pittsburg* also ran the batteries and joined the *Carondelet*. Early on the 7th they engaged the enemy's battery furthest down the river, and silenced it in three-quarters of an hour. The other batteries made little resistance. This success was signalled to the General, and the army at once began to cross. The enemy evacuated his works and tried to escape, but his road was cut off. That night at 10 the island and garrison surrendered to the navy, and 7,000 men and three general officers laid down their arms.

After the fall of Island No. 10 the army and navy at once advanced on Fort Pillow, some thirty miles down the river. The army was soon called off to reinforce General Halleck at Corinth, and the action of the fleet was confined to mortar and long-range firing. Foote's wound had now become dangerous, and on the 9th of May he was obliged to go North, transferring his command to Captain Charles H. Davis. A novel force of fourteen river steamboats converted into rams had been raised by the Confederates for the defence of the river, and eight of these were lying under the guns at Fort Pillow. (Six of them, with most of the Confederate gunboats, had been sent down the river to assist in the resistance to Farragut.) Early on the 10th of May the eight rams made a dashing attack on our seven gunboats. A spirited but confused action ensued, which was not altogether to the credit of our arms. Our boats were slow in supporting each other, and three of the seven did not get into action at all. Two of the four that did were sunk. Three of the enemy's rams were disabled, but drifted back to Fort Pillow, out of our reach. After General Beauregard evacuated Corinth the whole of his line had to be withdrawn. Fort Pillow was evacuated June 4, and the fleet at once moved down and took possession. The next day it proceeded to Memphis. The day after its arrival (the 6th) the Confederate rams, eight in number as before, moved out to meet it. The Union fleet consisted of five gunboats and two of Colonel Ellet's rams, which took a prominent part in the mêlée that ensued. This was spirited and tumultuous. Four vessels were quickly disabled or sunk by ramming, and two more blown up. When four of the Confederate boats had been lost, the other four ran down the river, hotly pursued by our boats for ten miles. The shore was thronged with people watching the exciting sight. Only one of the four, the *Van Dorn*, made her escape. The six rams on the lower river had perished when New Orleans fell, so this was the end of the Confederate River Defence Fleet. Memphis surrendered the same day. Captain Davis spent a few days opening the White River, and then went down the Mississippi with four gunboats and six mortar-boats. Early on the 1st of July Farragut's high seagoing spars were sighted above Vicksburg, and the two fleets met. The river was open, except for Vicksburg, but a year more of labor and conflict were needed to clear it entirely.

The advance from the mouth of the river had been no less prosperous and more brilliant. A week after the capture of Fort Donelson Captain Farragut had taken command of his station at Ship Island; a month later he had become suddenly famous by his passage of the river forts. In this he had lost one ship only, the *Varuna*. She was a fast boat, bought from the merchant service. Advancing imprudently beyond support, she was rammed on both sides by the Confederates, ran her bow into the east bank, and sank to her top-gallant forecastle. The Confederate ram *Manassas* was destroyed by the guns of the *Mississippi*. She took fire, floated down the river, exploded, and sank. The top of her unwieldy casemate and smokestack just awash on a mud-lump in one of the passes, and the masts of the *Varuna* above the forts, were for weeks the principal monuments to vessels passing up the river of the great deeds lately done there. All of the Confederate boats were destroyed or taken, and New Orleans, with all its defences and approaches, and even Pensacola, at once fell into our hands. In all this the army had little share, except to garrison the points surrendered to the navy. Most of the fleet was then sent up the river. Baton Rouge and Natchez surrendered when summoned. The Confederates were at work fortifying Grand Gulf, but Port Hudson was not yet occupied: Vicksburg alone held out. Farragut, against his judgment, in obedience to orders from Washington, determined to pass it, which he did on the 28th of June. This passage of Vicksburg added to his fame and discharged him of his orders, but was barren of results. It was evident that the place could only be taken and held by land forces. On the 1st of July, as we have seen, he was joined by Captain Davis, with a portion of the fleet from Cairo.

The next winter, in the arduous and protracted operations which ended in the capture of Vicksburg, the peculiar river warfare showed its extreme phase. This service was unique and striking. The solitude of the vast forests; the loud echoes of the guns; the extreme crookedness of the streams, requiring often the aid of lines ashore to pull the head round the bends; the frequent picking up of men overboard in this amphibious work; the excitement of looking for a shot from each commanding hillock in the straight reaches; the rather vague habit of shelling the woods on suspicion; and the wild activity on board following a beat to quarters, compared with the solemn stillness of the forest, made a life as different as possible from the common notion of a sailor's routine. While Admiral Porter was putting General Grant in position to take Vicksburg, Admiral Farragut had made his famous passage by Port Hudson in the *Hartford* with the *Albatross*, and closed the Red River permanently to the Confederacy. Vicksburg surrendered on the 4th of July, and Port Hudson on the 9th. This opened the Mississippi to the Gulf, and a steamer leaving St. Louis on the 8th reached New Orleans on the 16th without molestation. Attacks from guerillas along the banks, however, continued till the end of the war.

In August, 1864, Admiral Farragut fought the last and greatest action of his life in Mobile Bay. This is described in all its particulars with the fulness and accuracy that characterize the book. We notice only one trifling error. In the description of the monitors, the pilot-house is said to be above the turret, and concentric with it. We think our memory cannot be at fault in saying this was not the case with the *Chickasaw* and *Winnebago* at least. Their pilot-houses were detached, and just abaft the forward turret. But the obstructed channel; the lines of torpedoes; the formidable *Tennessee*, with her consorts; the tragic fate of the *Tecumseh;* the hesitation of the *Brooklyn;* the confusion in the line corrected by the prompt action of the resolute Admiral—even the succession of events and the exact time of each in the excited tourney with the *Tennessee*—are described at length. Perfect accuracy of recital is hardly possible concerning times of such excitement and movement. Our author says when the *Brooklyn* reported "Torpedoes ahead" the Admiral paused a moment, then ordered his ship and his consort ahead, and made the signal "Close order." Another version, to which we incline as more characteristic, is, that when the *Brooklyn* backed, the *Hartford* passed close under her quarter. When Captain Alden reported "A heavy line of torpedoes across the channel," the Admiral returned, "Damn the torpedoes! Jouett, full speed. Four bells, Captain Drayton," and led the fleet in in utter disregard of the safe course he had carefully prescribed to avoid the torpedoes. Commander T. A. M. Craven, of the *Tecumseh*, in spite of these instructions, had turned his course to the westward of a red buoy among the torpedoes, to his instant destruction. Mr. John Collins, his pilot, was in the house with him, and both sprang for the ladder, over which lay their one chance for life. At once the officer, true to the duties of his rank and his instinct of honor, drew back and said calmly, "After you, pilot." The pilot barely escaped, and lived to tell the story and secure to its hero a fame for honor and bravery second to no other in that famous fleet.

There was another incident in this action worthy of the relations subsisting between Sir Gervaise Oakes and Admiral Bluewater in 'The Two Admirals.' Commander Mullany was in a ship not suited for this engagement, and his opportunities for distinction had been less than those enjoyed and improved by Commander Stevens of the *Oneida*. The latter, therefore, gave up the *Oneida* to his friend, and himself took the monitor *Winnebago*. The *Oneida* brought up the rear of the column, and suffered relatively more than any other ship from the fire of the fort, when it was no longer controlled by the broadsides of the large ships. One of her boilers was exploded, and her steering-gear shot away, and she was slowly carried by the fort by her consort, the *Galena*. In this crippled condition she was raked by the *Tennessee*, and Captain Mullany had his wish at the cost of an arm. The *Tennessee* then turned to ram her. Commander Stevens had attracted much admiration by taking the *Winnebago* past the fort, coolly walking about on her deck alone and unprotected. Just as the *Oneida* was expecting her *coup de grâce*, he interposed his ironclad between her and the *Tennessee* and saved her. The crew of the *Oneida*, whom he had left only a day or two before, leaped on the rail and cheered heartily their old commander and present deliverer.

THURLOW WEED'S AUTOBIOGRAPHY.

Autobiography of Thurlow Weed. Edited by his Daughter, Harriet A. Weed. Boston: Houghton, Mifflin & Co. 1883.

It was natural that the appearance of Mr. Weed's autobiography should have been awaited with a general interest and curiosity. It was not so much because of the self-developed career of the writer: countless other Americans might have pointed a moral or adorned a tale of self-made success much more effectively than even Thurlow Weed. But there was another aspect of his life which was completely overshadowing in its interest—his career as a party manager. Here was a man who for two generations had occupied a large share of public attention. He was seldom seen at work upon the surface of politics; he was believed, justly or unjustly, to be pretty constantly and busily at work beneath the surface, and this belief was fortified by the evident disposition of all who were "inside" of politics to consider him a potent factor for or against them. To one section of his countrymen he was always a mysterious power for evil; to another, a cautious and reliable counsellor, whose prognosis of a popular movement was almost infallible; to another, a zealous and successful promoter of every private enterprise that promised public good; to posterity *stat*

nominis umbra. He was a professional lobbyist, an unscrupulous trickster and partisan schemer, a malignant enemy of all who refused to bend to his will, a hard but honest fighter, a high-souled and clean-handed patriot, a venerable old man who had served his country well and loved it better: all these epithets have been applied to him by men who believed in their truth as they believed in their own existence. It was believed that fifty years of politics had made his breast the repository of most of the secrets not only of his own party, but of the opposition; and, when his autobiography was announced, it was natural that men should look for a laying bare of the long-buried Pompeii and Herculaneum of New York politics.

All such expectations are met by a flat disappointment. The autobiography has much of what was known before, but little of what we might have expected to find. What were the secrets by which Edwin Croswell, Silas Wright, Martin Van Buren, and their associates built up and maintained the Democratic organization in New York? How did the firm of Seward, Weed, and Fillmore hold the citadel of opposition to Democracy in western New York? How did the firm of Seward, Weed, and Greeley learn the secret of the Regency, and apply it to the overthrow of the Regency in New York? How was the firm of Seward, Weed, and Greeley dissolved, and what did the partners think of the new men who realized on its assets? Such questions find no answer in the pages before us. Instead, we have about 200 pages of early reminiscences, padded with lists of forgotten men of former times whom the writer has known or met in stage-coaches, in canal-boats, or at political conventions; about 300 pages of extracts from the Morgan trials, and from the contemporary anti-masonic literature which may be found catalogued in Gassett's volume; and about 200 pages of later reminiscences, all of them readable but not strikingly new.

There are some exceptions, which go just far enough to show what an interesting and valuable volume Mr. Weed missed making. His refusal to publish Webster's speech in favor of the United States Bank in 1830 (p. 372), and his reasons for believing that two sentences of Jackson's veto message would gain ten votes where Webster's speech would gain one, showed the political intuition which was already characteristic of the man. He gives (p. 374) double authority for the assertion that Secretary McLane and Nicholas Biddle had amicably agreed, in 1832, on modifications of the bank charter which would have relieved the Bank from all its political difficulties, but that Clay and Webster refused to agree to the changes, and insisted on war—a fact that must materially modify any honest judgment of the struggle between Jackson and the Bank. The manner in which he contrived, in 1838 (p. 444), by eliciting an unexpectedly violent speech from a Whig member of the Legislature, to obtain for the Democratic managers their solid party vote for the abolition of small bank bills, and thus to secure a complete Democratic defeat in the following election, is excellently told, and is a fair example of the contributions to our knowledge of the past in which it was hoped that this work would be prolific. Another such example is the story (p. 495) of his ingenious and successful method of "beguiling" the Secretary of State, John C. Spencer, into harmony with his associates in the canvassing board. A few others may be cited: the manner in which Weed influenced Taylor's letter-writing proclivities in 1848 (p. 573); the interview of Jefferson Davis, Stephens, Clingman, and other Southern Congressmen with Taylor in 1850, and their attempt to coerce him into vetoing the bill to admit California (p. 617); and Lincoln's offer, in 1861, through Thurlow Weed, of a Cabinet position to John A. Gilmer, of North Carolina.

But, in general, such examples are conspicuous only by their absence from the places where we might reasonably have expected to find them. The political history of 1850–60 is a complete blank, and that of the other years is almost a desert. What is true is not new, and what is new is not of any particular moment. The autobiography is as readable as the reminiscences of an old man of affairs usually are; but, as political reminiscences, and, above all, as the political reminiscences of Thurlow Weed, the volume is unquestionably a very great disappointment. In the author has passed away the last of the former New York politicians, a species whose ideas were as foreign to the coming methods of politics as those of the Moorish knights of Granada were to the engineering of Ferdinand's battering train. Their political campaigns were fought with a vigor of personal prowess, an intensity of personal interest, to which the business methods of after years must be comparative strangers; and it is a pity that they have left no record. They seem to have fought under a system of tacit conventionalisms, which they made it a point of honor not to break. They have kept faith with one another, and, to a great extent, with their adversaries as well; they have died and made no sign. We may suspect much; we may believe much; but we can now know very little of the inside management of the long battle between the New York Democracy and its various opponents. That is a chapter of political history which has long been closed; but the death and the autobiography of Thurlow Weed have sealed it.

Four Masters of Etching. By Frederick Wedmore. With Original Etchings by Haden, Jacquemart, Whistler, and Legros. London: The Fine Arts Society. 1883.

In his preliminary remarks Mr. Wedmore says: "Perhaps the two qualities which, as one gets a little *blasé* about the productions of art, continue the most to stir and stimulate and to quicken the sense of enjoyment are the quality of vigor and the quality of exquisiteness." He then goes on to remark that these qualities are united in the greatest artists only—such artists as Titian, Rembrandt, and Turner—while, with men of lesser genius, it is enough if we find either quality developed; the union of the two, in any fulness, demanding a temperament of exceptional variety. To this we cannot quite agree. In our view, the union of these two qualities is essential to all artistic power, whether great or small. To speak as if the quality of vigor alone might suffice for the production of any form of good art, is to ignore the fact that vigor is serviceable, and the results of its exercise are admirable, only in so far as it is coupled with accuracy and refinement, which constitute essentially what we understand by exquisiteness. And it is erroneous to suppose that the quality of exquisiteness can exist without precision, which implies vigor.

With regard to Mr. Haden's work, we think that Mr. Wedmore is not discriminating enough. A great many, if not the greater part, of Mr. Haden's etchings are excessively loose, sloppy, and wanting in specific character, and, though vigorous, certainly their vigor is not of that admirable kind which coexists with strict government of every line. The example entitled "Grim Spain" in this series is largely of this inferior class. We have before expressed our admiration for Mr. Haden's better work, and our regret that he does not always seem to do his best. To imply, as Mr. Wedmore does, that the general character of his work is exemplary in its quality of vigor is unwittingly to mislead.

With regard to Jacquemart, Mr. Wedmore's remarks are appreciative and interesting, as well as for the most part discriminating. We should, however, express ourselves in somewhat different terms if called upon to estimate Jacquemart's art. His fineness and delicate skill are, indeed, very admirable, but his conception and treatment of his subjects have never been wholly satisfactory to us. There are in general two ways of dealing with such objects as he commonly chose to portray: one in which the broad beauties of form, color, and light are felt and expressed with greater or less fulness of realization—as a flower is painted by Titian; the other in which the minor qualities of structure and texture are so unduly scrutinized that the more important qualities are missed—as still-life is often painted by artists of the Dutch school. The one is a noble, and the other an ignoble method. We do not mean to affirm that Jacquemart's treatment was altogether of the Dutch kind; but we feel that it had not enough of the nobler characteristics. There is in him a lack of the largest artistic feeling, and consequently we tire of his art as we do not of the art of Titian. In the chapter on Whistler are some good critical remarks, though the author does not seem to feel the invariable ugliness of Whistler's design, which goes far, even in his best etchings, to overbalance his subtle suggestiveness. We have never been able to admire much the etchings of Legros; but the portrait of Mr. Watts given in this series appears a good and expressive piece of work, notwithstanding some marked errors in proportion—as where the nearer eye, which is seen full, is drawn shorter than the one that is foreshortened. On the whole, it cannot be said that these etchings are of very high character. Those by Haden and Whistler certainly convey no adequate idea of the powers of these two artists respectively.

Local Government. By M. D. Chalmers, M.A. [English Citizen Series.] London and New York: Macmillan & Co. 1883.

The American Citizen's Manual. Part 1. Governments, The Electorate, The Civil Service. Part 2. Functions of Governments (State-Federal). [Questions of the Day Series V. Edited by Worthington C. Ford.] G. P. Putnam's Sons. 1882.

Probably there is not in the world a more extraordinary piece of political patchwork than the local government of England. "The inhabitant of a borough lives in a fourfold area for purposes of local government—namely, in the borough, in a parish, in a union, and in a county—none having the same boundaries (unless by accident) with any of the others. He is, or may be, governed by a sixfold authority—the municipal council, the vestry, the school board, the burial board, the guardians, and the county quarter sessions. He is, or may be, subject to a borough rate, a general district rate, a poor rate, a burial rate, and a county rate." The inhabitant of a rural parish is subjected to equal anomalies. "There is a case of a farm of two hundred acres in Gloucestershire which, some few years ago, was in twelve parishes, and subject to about fifty rates." The inhabitant of one of our political divisions who pays all his taxes once a year in a lump sum has little idea of the vexation caused by the continual knocking at his door of a multitude of authorities who demand money for as many different purposes. That local self-government is possible at all under such a system is probably owing to the existence of a limited suffrage based upon pro-

perty. We hear a great deal in this country about extravagant expenditure caused by universal suffrage. It is well to note that local indebtedness in England, which, in 1875, was £92,000,000, had reached in 1881 a total of £144,000,000, or an increase of more than £8,000,000 a year. Perhaps one of the greatest of modern reforms in respect to local government consisted in the establishment of the Local Government Board of 1871, of which the president is a Cabinet minister, with a seat in Parliament. By such a power only could reform be achieved without revolution, and it will be most interesting to note the results of its labors in the next fifty years.

Mr. Ford's 'Manual' includes the national as well as local governments, and has a strong flavor of an American tendency to state facts less as they are than as they are assumed and perhaps ought to be. Thus one is inclined to smile on reading: "But the power does not rest ultimately with these [representative] bodies; they are clothed with certain functions by the people, who may at pleasure take them away or modify them, for the people alone are the real rulers"; and when we read, further, that "fulness of debate is secured by the rules which govern the procedure of either house," we may doubt whether that is exactly the conclusion to be drawn from following the proceedings of a session. Mr. Ford says: "Each house is very properly made the sole judge of the election returns and qualifications of its members, for there is no other branch of the Government to which this power could safely be trusted." But when he adds, on the same page, that "it is no infrequent event for a contested seat to be given to one whose only recommendation is that he is of the same politics with the dominant party in the houses, and without any regard to the legal aspects of the case," and when we consider what has been and is being accomplished in England for the purity of elections by referring contested cases to the law courts, the statement seems quite too broad. There are frequent instances of this tendency to glide gently over dangerous ground. Thus, after describing the method of caucus nominations, Mr. Ford mildly adds: "The members of the committees hold from year to year, and come naturally into some special knowledge of the politics and politicians of their districts, and are apt to obtain an undue influence and control of the political mechanism." The cause of this we take to be a desire to avoid the croaking spirit which points to our political weaknesses as a condemnation of popular government. We regard the true method to be, however, to expose these weaknesses, but to declare boldly, what we sincerely believe, that they are not necessary incidents of popular government, but only defects of organization, which can and ought to be amended. That clearness of insight is not wanting to Mr. Ford is proved by his quoting both Chancellor Kent and Daniel Webster to the effect that the legislature is the branch of government which is most apt to enlarge its own sphere of action by encroaching upon the functions of the executive and judicial branches, and by assuming powers which properly belong to these latter branches. Mr. Ford also points out that, notwithstanding the boasted separation of the branches, they do in fact overstep the boundaries, as the Senate in confirming appointments exercises an executive function, Congress in passing upon contested elections a judicial function, and the President, through his veto, a legislative function—a remark which upsets the main argument of those who oppose giving the cabinet officers seats in Congress, with a share in the guidance of legislation.

But the part of Mr. Ford's work with which we agree most heartily and regard as of most value is the chapter on "Offices and Office-holders," in which he points out the great superiority of the Federal organization over that of the States and municipalities, in that the former rests upon the appointment and responsibility of individuals, deriving directly from the President through the whole chain of administration, whereas local offices are filled almost wholly through election, either by the people or the legislatures. The defect of the Federal administration—which we believe to be otherwise as good as any in the world—is in the failure of public enforcement of responsibility by Congress and the Executive upon each other, whereas in the States and cities there is no such thing as responsibility and hardly such a thing as administration at all. It is curious to note, in following out this idea, how it results in the absorption of all power by the legislative branch, because the executive, with its incoherent and separately elected officials, being reduced to absolute impotence, the legislature really carries on the government by committees and commissions under its exclusive control.

How is reform to be accomplished? In urging the practical teaching of political science in our colleges and higher institutions of learning, we are met by the objection that advancement in public life does not depend upon qualification for it, and therefore there is no advantage in and no demand for special training. We reply that the welfare of this country depends upon the knowledge among the people of the real end and aim of all government, and of the advantages, the dangers, and the requirements of popular government in particular; and that for this purpose the thousands of students who are so fortunate as to obtain advanced education before entering upon active life should carry with them, while still full of energy and high purpose, a thorough understanding of problems like those considered in the books under review, instead of acquiring that knowledge—if indeed they ever acquire it—after advancing years and the cares of life have dulled the courage and hopefulness which are the essential conditions of any great achievement.

The Iroquois Book of Rites. Edited by Horatio Hale, M.A. Philadelphia: D. G. Brinton. 1883. 8vo, pp. 222, with a map.

THIS addition to Brinton's "Library of Aboriginal American Literature" may be said to open a field of Indian research new to ethnologists. Its author was the philologist of Wilkes's Exploring Expedition (1838-42), and discoverer of the Tutêlo language, upon which he has lately published an elaborate article in the Proceedings of the American Philosophical Society of Philadelphia (March, 1883). The scope of Brinton's "Library" is to enrich and illustrate American ethnology by the oral literature and writings of the Indians themselves; and the Indian documents or texts to which the present volume owes its origin are the 'Ancient Rites of the Condoling Council,' written in the Mohawk, and the 'Book of the Younger Nations,' composed in the Onondaga, dialect of Iroquois. These precious relics of antiquity are concise in their wording and full of meaning, though they occupy, with their translations standing opposite, but thirty pages. The first and more important of these texts was shown to Mr. Hale in September, 1879, by the headmen when he visited the "Iroquois Confederacy," settled on a reservation near Brantford, Ontario. Upon closer examination, the book proved to be a document comprehending all the speeches which were from olden times, and are now, addressed by the representatives of the three elder "nations" (Canienga, "Flintmen," or Mohawk; Onondaga; Seneca) to the younger members of the Confederacy, whenever a chief belonging to the latter is lamented and a new one installed. It is probable that these orations were first set down in writing about the middle of the eighteenth century, when the ancient rites and traditions still flourished, although the duplicate copy exhibited to Mr. Hale was not older than the year 1832. The members of the general council of the Iroquois, which met at Onondaga before the partial emigration of this race to Canada, were by no means proportionate to the population of the tribes they represented; but this was of little consequence, for to arrive at a decision unanimity of the "nations" was necessary. This was the same council before which the "condoling speeches" were delivered; and the ceremonial observed on such occasions was of a quaint and archaic description. It was by no means easy for the author to obtain reliable interpretations of the texts, for only the oldest men in the tribes are able to give a satisfactory account of the manifold obsolete terms contained in them. The Onondaga text is a curious counterpart and natural complement of the Mohawk or Canienga text; it gives us the exhortations which are addressed by the younger nations to the elder when a chief of the latter is mourned, and is written in a different kind of orthography.

It would have been far from easy to comprehend the texts and translations appended but for Mr. Hale's laborious endeavors to elucidate them historically, ethnologically, and grammatically. The additions made by him are almost as valuable as the texts themselves, although one may refuse credence to some of his theories. The Introduction contains chapters on the history of the Huron-Iroquois tribes; the Iroquois league in the State of New York, its laws and founders, clans and classes; the modes and rites of condolence and installation of newly-elected chiefs in the Iroquois Confederacy; the Iroquois character and policy, as well as the general features of their language. Appendices follow the text, enlarging upon tribal and town names of Indian origin, upon the Hiawatha myths, etc. After a full glossary, conscientiously explaining and parsing the Indian terms of both texts, the volume concludes with a copious alphabetic index of its contents.

Socialism and Communism in their Practical Application. By the Rev. M. Kaufmann, M.A. London. 1883. Pp. 264.

THE author of this excellent little book is not unknown to the student of social philosophy. His more pretentious works ('Socialism' and 'Utopia') present, perhaps, the best introduction to the conceptions of those writers who oppose excessive individualism of which the English reader can avail himself; the former of these, indeed, is based on the exhaustive treatise of Dr. A. E. F. Schäffle, 'Kapitalismus und Socialismus,' and is properly to be regarded as an exposition of that writer's opinions.

In the treatise now before us, which is published by the Society for Promoting Christian Knowledge, Mr. Kaufmann has undertaken a somewhat different task. His purpose, as stated by himself, is "to examine some of the most important experiments, made from time to time by social reformers, to realize in actual life their theories of social improvement." In following out this plan he passes in rapid review communistic movements from the time of Christ to the present day. He describes religious and humanitarian endeavors for social regeneration upon the basis of common property as undertaken among the disciples of the early Christian Church, among the monastic orders of the pre-

reformatory mystics, among the native converts under Jesuit rule in South America, among the Protestant Separatists seeking religious and civil liberty in the United States, and among the anti-religious secularists. In reality this treatise is an edited note-book. Its author has studied with care a certain line of experiments, extending through eighteen centuries of time, that have taken place in the laboratory of society, and presents here what appear to him to be their teachings.

Perhaps the most important fact to which a study of these experiments in social life leads, is, that whatever degree of success may have attended any attempt at communal living has been due to the subordination of the purely industrial motive, which in the world at large is the mainspring of all activity, to the realization of some high moral ideal. This ideal, it is true, may vary in form, but it is found ever to rest on what is termed the religious element in human nature. Whatever name these societies may have assumed—Cathari, Apostolicals, Fraticelli, Béguines, Waldenses, Albigenses, Lollards, or Hussites—it is possible to discover in each case one underlying purpose, "to reëstablish social life on the pattern of Apostolic simplicity. There is the same blending of secular and sacred duties of humanity; there is the same protest against luxury in the Church and the same impatient revolt against social inequality in the world, and with them a willingness to suffer martyrdom in the cause and to undergo self-inflicted privations for the purpose of self-discipline."

From 1500 to the middle of the last century, there is found infused into the disciples of Communism the free spirit of the Reformation, and to a large degree, also, that feeling of individual right which gives character to our own times. The yet later experiments in communistic life are of two quite distinct types; the one resting on an excessive interpretation of Christian teachings, the other arising out of the revolutionary movements of the last century and resting on what may be broadly termed the religion of humanity. Among the former are the Shakers, the Harmonists, the Amana Society, and others like them; while as illustrations of the latter may be mentioned the Owenite settlements, Fourierist phalanstères, and Icarian communes. It is a peculiar fact that all of these last without exception regarded their societies as the leaven that was to transform the world. They have been by no means so successful as the purely Christian societies, and as a rule it may be said respecting them, that their success as a commune lasted only so long as the blessings of material prosperity were withheld. The human sentiment of mine and thine seems to have been too strong for any ideal not shrouded in mysticism. The fact is well brought out in this book that the essential of communistic success is "the spirit of pietism and self-surrender," and the author very properly concludes that it is absurd to expect success for those communistic schemes in which material enjoyment and self-indulgence are made the *summum bonum* of existence. Another point of interest pertains to the societies of the Middle Ages, which for the most part were monastic in their character. The conditions for their successful continuance were provided by the egoistic society in which they were situated. "Without the existence of a larger outer world, which to a certain extent ministered to the wants of these recluses, their societies, admirably organized and governed as they were, could not have stood the test of time." For modern communists, therefore, who purpose remodelling the world according to this plan, the fact that these societies endured for so many years can offer no very direct encouragement.

While commending this book as presenting in an admirable manner certain facts that should be known, it is yet subject to one severe criticism. Its title does not properly represent its contents. It should be Communism rather than 'Socialism and Communism.' These two words represent distinct movements, movements which differ in philosophic conception, in aggressive methods, and in the ideal toward which they strive. They are in harmony only so far as they are opposed to excessive individualism, and clear thinking requires that they be kept entirely distinct.

Ancient Greek Female Costume. Illustrated by 112 plates and numerous smaller illustrations, with explanatory letterpress by G. Moyr Smith. London: Sampson Low & Co.; New York: Scribner & Welford.

THAT modern artistic taste is not content with modern garb is clear; how to get at a reform is not so clear. Yet unless a radical reform is made we shall never have either a rational or an artistic costume, and the consequences will be extravagance and constant mutation of style on one hand, and on the other a complete divorce of all our daily impressions from any perception of the beautiful. A man might as well hope to retain his delicacy of touch while daily handling hot iron and washing his hands in alum solution as to think of preserving a sense of beauty while he has "stove-pipe" hats, dress-coats, and the various angularities and furbelows of woman's dress thrust into his eyes continually; and as to making an art from it, not even a Watteau could succeed in getting such a result out of the garb of to-day.

The root of the modern want of perception of the beautiful is, in a way, moral—not ecclesiastical or devotional, however, but in a larger sense. The production of a beautiful costume is the work of time and selection; and only where it has become hereditary, national, or otherwise continuous from generation to generation, can this process of selection and survival of the fittest go on. Every change must be weighed and approved by the general sense, and what doesn't "wear" is thus surely and continuously rejected. This is the way in which the picturesque national costumes have all been evolved; and the temper by which they are preserved from such innovations as our modern fashion-plate figure is one purely conservative and reverential, while the civilized passion for variety demoralizes the æsthetic sense, and substitutes a false and morbid passion for change and novelty of sensation for the pure and tranquil enjoyment of what is really beautiful. The chief motives in modern dress are vanity, vulgar emulation, ostentation of wealth; the chief incentive being a jaded condition of the æsthetic sense comparable to that condition of the gustatory in which it is blunted to common sensation, and requires artificial and extravagant stimulants to make it feel anything. Doubtless, a woman may be a model of all the higher virtues and moralities and wear the most depraved products of a French mantua-maker's diseased fancy, but on condition only of her not being responsible for the fashion herself: the woman who is volunteering in the van of the rush after the last fashion can hardly be a good wife, mother, or citizen.

Books like this of Mr. Smith, which from its preface declares itself directed rather to æsthetical than archæological education, must wait to produce their effect until the æsthetical perception is formed, or reformed. No reform in dress, or true taste in it, is to be hoped for until people perceive that novelty, so far from being a desideratum in that province, is really an impediment to the evolution of the beautiful. Still, such works as this have their value in keeping before the eye types of dress that are really beautiful, and recognized as such by the continuous judgment of humanity; and if Mr. Smith, instead of giving us almost entirely costumes of Greek goddesses, which may be assumed to have a certain ritualistic form, had gone to the Tanagra statuettes and given us a series of actual costumes worn by Greek women in real life, he would have rendered us a service much greater than he has done. The maxim, "Beauty when unadorned is adorned the most," must be taken with large qualifications; but it is true that a certain simplicity in dress is the highest quality in dressing well and tastefully, and for this we must always go to Greek usages, especially as preserved for us in the figurines of Tanagra, Attica, and Myrina, of which a large collection might be formed of real educational value. Mr. Smith gives 149 plates to illustrate his work, of which forty-six represent what may be considered more or less lay costume—some of them repetitions without great importance, and mostly taken from Hope ('Costumes of the Ancients') and Müller ('Denkmäler'); in fact, the book is little else than an epitome of these books, as far as they treat of female costume. The engravings are always slight, and sometimes trivial, but perhaps sufficient for their purpose. The essay is full of authoritative references and explanations, and may be accepted as a fair handbook on the subject. If the author had known better the stuffs still in use for dress in remote and primitive districts, he would have treated some parts of his subject more intelligently, as when he alludes to the stuff in one of his plates (104) as "seamed by the sculptor into minute lines which resemble in effect the lines in knitted worsted-work" (p. 17), whereas it closely resembles the stuff still woven in some parts of the East, especially in the mountains of Crete, which is evidently the same as that which the ancient sculptors represented. The author's political discursion is singular. That "ancient Greece in its prime was much larger than the modern kingdom," every schoolboy knows; but that it (if a political entity is meant) ever "possessed" Crete, Cyprus, or Magna Græcia and Sicily, is a confusion of meanings which would not have been aggravated if Marseilles, Trieste, Ragusa, etc., had been included. "Greece" in this sense never was a state, and cannot be compared with modern Greece. The notion that "some of the ornaments of Mykenæ at least were part of the Trojan spoils gathered at the sacking of Ilion," makes it clear that Mr. Smith's archæology is in a very embryonic condition. No scientific authority will sustain him in this simple minded belief, and "Priam's treasure" is as effectually relegated to the category of myths as Ulysses's Hephæstean armor.

On the whole, it seems clear that Mr. Smith has no special qualification for editing such a work, and the fact, which he frankly admits, that "it was only comparatively recently that he discovered that such a book as Hope's 'Costumes of the Ancients' existed," shows that his researches must have been very superficial.

Mysteries of Time and Space. By Richard A. Proctor. R. Worthington. 1883.

HARDLY worth the name of a book, we have here another collection of Mr. Proctor's essays merely. In rare parts they are good, but, like so many of their predecessors, are conspicuous for their prolixity, and, as a whole, worth only the slenderest commendation. In what he says of the prophecies he quotes regarding "The World's End," Mr. Proctor affords the most fitting characterization of much of his own essay-writing—"mere rubbish." The most compel-

ling, and at the same time repelling, feature of the volume is its omniprevalent pugnacity. Of a world of scientific worthies—Tait, Darwin, Spencer, and others—not one escapes his vulgar carping. If not positively unbecoming, it is surely in questionable taste for a writer of popular papers—not to say one who has his knowledge chiefly at second-hand—to consider himself called to pass upon the theories and researches of very distinguished investigators; but Mr. Proctor does this, not only with a rambling unconsciousness of his own follies, but with an unblushing self-assertion which transcends boldness and approximates to downright impertinence. This infelicitous habit of composition holds, we believe, in every essay but one or two of the present collection, and these, doubtless, would have been written in the same vein except that they relate to matters so trashily speculative that nobody had ever before ventured any opinion on the subject.

The past twenty years have witnessed a constantly growing demand for popular scientific literature. For a good while Mr. Proctor met this demand, so far as astronomy was concerned, in a very commendable manner. But his later writings indicate an exhaustion of his stock of popular scientific fact; and our kindly word to him is, to retire into the privacy of further study to recuperate his energies for subsequent literary endeavors.

The Papers and Biography of Lion Gardiner, 1599–1663. With an Appendix. Edited, with Notes Critical and Illustrative, by Curtiss C. Gardiner. St. Louis. 1883.

It is with regret that we pronounce this handsome volume to be a failure, because such family records generally claim so moderate a rank. But it points out a defect which gentlemen of leisure are apt to overlook—namely, that a useless book is worse than nothing. In the present case, out of the hundred pages of the book, only two have any value—namely, those which give a list of the proprietors of Gardiner's Island, and the pedigree of the author's own line. The other contents are merely reprints of well-known documents, not sufficient to constitute a biography. Besides these, the editor has appended some whimsical notes, which only reveal his lack of special information.

It is greatly to be regretted that any descendant of the well-known engineer and soldier, Lion Gardiner, having the means and the desire to print a memorial, should have lacked the happy inspiration of getting some competent person to collect and arrange the material for him. The theme is an interesting one, and, in the hands of a local antiquary, it would doubtless have been productive. What is expected nowadays in such a book is exact details and careful arrangement. It is certain that the history of the manor of Gardiner's Island, and a sketch of its successive proprietors, their connections and offshoots, would be a welcome addition to American genealogy. It is seldom that the possessor of family papers, traditions, and memorials is also competent to give them a suitable form. But to avail of the services of a compiler is no more unnecessary or unreasonable than to secure a printer.

Historic Romance. Strange Stories, Characters, Scenes, Mysteries, Memorable Events, in the History of Old England. By William Andrews, F.R.H.S. London: Hamilton, Adams & Co. 1883.

This is the fourth volume which Mr. Andrews has compiled in the interest of such as seek amusement from facts and incidents more or less out of the beaten track; and even to gather from it that his hand has lost nothing of its cunning, is to conclude that he has once more been successful in his special line. Now that he has grappled with Gog and Magog, the two British giants who were slain by Brutus of Troy in the uncommonly dim historic twilight of B. C. 1008 or thereabouts, no one who marvels at the grotesque effigies of them which doubtfully adorn the London Guildhall need any longer allege that he must marvel in ignorance. Gretna Green and its stolen marriages, also, those who are curious about them cannot, thanks to his researches, rank henceforth among matters imperfectly understood. Incredible as it may sound, one of the sham clergymen of Gretna Green, Robert Elliot by name, is said to have transformed into man and wife no fewer than 3,872 couples between the years 1811 and 1839. The chapters entitled "English Life and Manners in the Time of Shakespeare," "Fools and Jesters of the English Sovereigns," and "Echoes of the Last Century," may perhaps be specified as particularly meritorious, though hardly perceptibly inferior to them is the account of the matrimonial and miscellaneous exploits and speculations of the famous Bess Hardwick, a woman of quite as masterful a spirit as the Bess, her contemporary, who filled a throne. But the entire volume is very good of its kind. In fact, it is just the sort of thing to lounge over agreeably under the trees in the afternoons of summer and autumn holidays.

BOOKS OF THE WEEK.

A Dictionary of Quotations from English and American Poets. Based upon Bohn's edition, revised, corrected, and enlarged. Thomas Y. Crowell.
Adams, G. B. Mediæval Civilization. D. Appleton & Co.
Autobiography of Charles Biddle, Vice-President of the Supreme Executive Council of Pennsylvania, 1745–1821. Philadelphia: E. Claxton & Co. $3.
Baker, W. M. The New Timothy. Harper's Franklin Square Library. 25 cents.
Balzani, U. Italy. [Early Chronicles of Europe.] E. & J. B. Young & Co.
Besant, W. The Life and Achievements of Edward Henry Palmer. E. P. Dutton & Co. $3.
Beyond the Sunrise. J. W. Lovell Co. 20 cents.
Blackmore, R. D. Lorna Doone. Harper & Bros.
Brehms' Thierleben. Chromo edition. Parts 95–98. B. Westermann & Co.
Bulkley, Prof. C. H. A. Plato's Best Thoughts. Compiled from Prof. Jowett's Translation of the Dialogues of Plato. New ed. Charles Scribner's Sons. $1 50.

Dr. Sauveur's Educational Works.

Sold by F. W. CHRISTERN, New York;
CARL SCHOENHOF, Boston;
JOHN WANAMAKER, Philadelphia;
ROBERT CLARKE, Cincinnati.

Just Out:

LA PAROLE FRANCAISE.

ONE DOLLAR.

It will be addressed, post-paid, to teachers who will send 50 cents to Dr. L. Sauveur, Randolph, Vt. Any of the other works of Dr. Sauveur may also be obtained for examination by sending half the retail price to the author.

Circulars will be sent to applicants.

"A paper for every rural householder."—*Nation.*

INDOORS AND OUTDOORS.

Published by the National Association for Sanitary and Rural Improvement, at 50 cents per year.

"Will be found a very useful and attractive monthly visitor to all whom it may concern"—that is, to everybody who wishes to improve rather than to let things drift until reform has become indispensable."—*Geo. Wm. Curtis, in Harper's Weekly.* Sample free. 119 Pearl Street, New York.

Second-Hand School-Books Bought, Sold, and Exchanged. Send for a catalogue. Back numbers and volumes of the *Nation* furnished. A. S. CLARK, 34 Park Row, New York.

Send for Catalogue of American Poetry from the Collection of the late C. Fisk Harris, of Providence. W. T. TIBBITTS, Providence, R. I.

CHARLES SCRIBNER'S SONS

WILL PUBLISH SEPTEMBER 15:

A NEW AND UNIFORM EDITION OF THE

Writings of Donald G. Mitchell (Ik Marvel),

INCLUDING THREE OR FOUR VOLUMES CONTAINING NEW AND UNPUBLISHED MATERIAL. In 12mo volumes, in original cloth bindings. Price, per vol., $1 25.

Now Ready: 'REVERIES OF A BACHELOR,' and 'SEVEN STORIES.' *(The remaining volumes will be published at short intervals.)*

Apart from the literary grounds on which it became important to establish a standard and uniform edition for Mr. Mitchell's works, with that final revision which an author always desires to give to the permanent form of his writings; there were strong practical reasons, in the wearing out of plates, the need of a lower price conforming to present conditions, etc., etc., which led his publishers to ask of him the coöperation necessary to such a reissue of the volumes.

The publication will be made additionally important by the appearance in it of new volumes, consisting in part of papers hitherto uncollected, and in part of a series of essays embodying results of studies in English history and literature and observations of travel.

Recollections of a Naval Officer. 1841-65.

BY CAPTAIN WILLIAM H. PARKER. 1 vol. 12mo, $1 50.

The author of this book entered the U. S. Navy in 1841, and resigned his commission in 1861, when he entered the navy of the Confederacy, and served to the close of the war. His recollections describe his cruises in the Mediterranean, off the coast of Brazil, and among the West Indies, in the Gulf of Mexico and the Pacific Ocean, and on the African Coast, together with an account of the naval operations during the Mexican war, and of his experiences in the civil war.

"The book has the breezy airs of the sea about it, and abounds with the happiest bits of humor and anecdotes told with inimitable point. It gives a picture of the 'Old Navy' as graphic as if drawn by Marryat. In his chapters on the late war he makes a contribution to history which will be recognized as of special value: but there is not a trace of asperity in what he has written, and each topic is discussed with a manly candor which will win the respect of every reader."

The Story of Rolan[illegible]

BY JAMES BALDWIN. WITH A SERI[illegible] ILLUSTRATIONS BY R. B. BIRCH. 1 vol. square 12mo, $2.

This volume is intended as a companion to 'The Story of Siegfried.' As 'Siegfried' was an adaptation of Northern myths and romances to the wants and the understanding of young readers, so is this story a similar adaptation of the middle-age romances relating to Charlemagne and his paladins. While 'The Story of Siegfried' exemplifies the sublime old-world spirit of the Gothic nature myths, its counterpart, 'The Story of Roland' is less remote, and the incidents, though equally wonderful, are of a more human character, and appeal with greater force to our sympathies. In Mr. Baldwin's hands the different legends of Roland and his companions are here fused into a straightforward story; and the history, the manners and customs of the time, as well as all that pertains to the institution of chivalry, have been faithfully and yet vividly represented.

East of the Jordan:

A RECORD OF TRAVEL AND OBSERVATION IN THE COUNTRIES OF MOAB, GILEAD, AND BASHAN, DURING THE YEARS 1875-1877. BY SELAH MERRILL, ARCHÆOLOGIST OF THE AMERICAN PALESTINE EXPLORATION SOCIETY. With illustrations and a map. 1 vol. 8vo. *A new edition.* Price reduced to $2 50.

"Dr. Merrill stands in the front rank of American archæologists. There is in America no better authority than he on all questions connected with the ancient life of the East, and his contribution to our knowledge of the Holy Land will take its place in the professional library alongside of 'Robinson's Researches.'"—*The Christian Union.*

"As a book of travels it takes high rank. Mr. Merrill's sketches of the land, the scenery, the people east of the Jordan, are fresh, vigorous, and full of life, and in this respect the book is never dull. He writes in an attractive style, and his descriptions of scenery are especially good. His book is beautifully illustrated throughout, largely from drawings made by himself."—*The Nation.*

A NEW STORY BY JULES VERNE.

Godfrey Morgan.

A CALIFORNIA MYSTERY. BY JULES VERNE. WITH NUMEROUS ILLUSTRATIONS. 1 vol. 12mo, $2.

Jules Verne's cyclopedic fancy this time finds scope for its vagaries in the Californian Eldorado, among the millionaires of absolutely limitless resources, who, the French romancer would have us believe, form a large class of the population around the Golden Gate. Nevertheless, the story is of the Crusoe order, and is concerned with the adventures of the restless young Californian, Godfrey Morgan, and his companion, the dancing-master, Tartlet, upon a strange island, where they have been wrecked. The story is one of the most amazing efforts of Verne's genius, and certainly lacks neither interest nor amusement. The illustrations are very numerous, and equal the text in force and character.

*** These books are for sale by all booksellers, or the volumes will be sent, post-paid, upon receipt of price, by*

CHARLES SCRIBNER'S SONS, Publishers, 743 and 745 Broadway, N. Y.

35 Cents a Number; $4 a Year.

HOUGHTON, MIFFLIN & CO.'S NEW BOOKS.

Twenty Poems

FROM HENRY WADSWORTH LONGFELLOW. Illustrated from Paintings by his son, Ernest W. Longfellow. 8vo, cloth, tastefully stamped, full gilt, $4; morocco, $9; tree calf extra, panel side, with polished bevel edge, $9.

These poems are illustrated with fifty designs, in which Mr. Ernest Longfellow interprets their spirit with rare grace and beauty. A fine new portrait of Mr. Longfellow is prefixed to the volume, and peculiar interest attaches to the book from the fact that the portrait and all the illustrations are from the hand of the poet's son. It is in all respects a very tasteful gift-book.

The English Bodley Family.

By Horace E. Scudder. Fully illustrated. With an ornamental cover. $1 50.

The American Bodleys and their English cousins visit interesting places in England, and talk of many persons and incidents famous in English history. The book is fully illustrated, and will gratify the hundreds of thousands who have read the previous delightful Bodley books.

How to Help the Poor.

By Mrs. James T. Fields. 60 cents.

A small book, embodying the results of many years' experience and observation in charitable work. It is not a sketch of theoretical philanthropy, but many examples are cited to illustrate the practical views which it is hoped this book may render more effective.

Longfellow's Courtship of Miles Standish.

Dramatized for Private Theatricals in Schools and Families, with full Directions for Scenery and Costumes. 15 cents.

*** For sale by all booksellers. Sent by mail, post-paid, on receipt of price, by the publishers,*

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 20, 1883.

The Week.

THE crops are now practically out of danger from any great loss. It seems tolerably certain that the cotton crop, though it may be a million bales short of the great crop of last year, will still be larger than the average of the past five or six years. The corn crop, notwithstanding the recent damage by frosts, can scarcely fail to be above the average of five years. The wheat crop, though probably 15 per cent. short of last year's, will be above the average, as will also be the yield of all other grains. In spite of all this there is still a stagnation of capital. Money continues superabundant for loans on collateral security at the abnormally low rate (for this season of the year) of 2 and 2½ per cent. per annum, and of 4½ and 5 per cent. per annum for sixty-day and four-months' loans, while the rates for discounts of mercantile paper have hardened, and are now 6 and 7 per cent. per annum for first-class single names. At the same time many of the dividend-paying stocks which have paid dividends regularly for ten or fifteen years are selling at prices upon which their dividends pay from 8 to 9 per cent. The great difference between the rate of 2 per cent. per annum on call loans—for which so much money is offered—and the 8 or 9 per cent. which the dividend-paying stocks would realize for the investor, shows that a feeling of distrust is still prevalent, and that capital is held out of investment, though the reasons for such distrust have to a large extent passed away. The first arrival of gold from Europe this season was 1,250,000 francs from Paris on Tuesday, the 18th. With a fair European demand for the large surplus of all our crops, the imports of gold this autumn are likely to be large.

Mr. Albert Fink gave the Senate Labor Committee on Monday an interesting account of the working of the railroad-pool system. He is at the head of a bureau representing the five East and West trunk lines—the New York Central, the Erie, the Pennsylvania, the Baltimore and Ohio, and the Grand Trunk, with their Western connections. The object of the pool is to arrange a uniform rate of tariff. He said that this did not interfere with competition, but it did interfere with railroad wars; in other words, with such competition in rates as threatened ruin to the weaker lines. For the purpose of avoiding this, agents of the different roads were scattered about the country, and all the intelligence that could be obtained was gathered and reported to the managers of these roads, who, with this information before them, established a schedule of tariffs. The object was to establish a rate that was not so high that business would be lost, nor so low that there would be a pecuniary loss. When the rates were placed very low on through-business it was common to put up the rates on local business, but as the railroads wanted both it could not possibly be for their interest to sacrifice one to the other. Further than this, railroad rates were to a certain extent regulated by the competition of the water lines, it being much easier, as Mr. Fink said, to put an extra steamboat or a dozen canal-boats on a route than to build a new railroad. But the main regulator of the rates we take from his testimony to be the self-interest of the companies, which must always try to make the transportation tax light enough to encourage the development of business.

In other words, this Trunk Line pool is a vast combination of the leading lines of the country, for the purpose of dividing among the roads that compose it, on a fair basis as concerns themselves, the total aggregate of all the business on which they live. The prime object of it is to prevent railroad wars, and that it does so, at least to a certain extent, seems to be conceded. Now, says Mr. Fink, this is not only a desirable thing for the railroads, but for the public at large. There can be nothing worse about a tax, whether on transportation or anything else, than that it should be fluctuating or uncertain. As it enters into the prices of all articles of commerce, violent fluctuations in it, such as are produced by railroad wars, make it impossible to tell in advance what prices are going or ought to be, and interfere with and often paralyze industrial activity. Therefore pools are to this extent a boon to the community. On the other hand, it is obvious that they concentrate enormous power over trade and commerce in the hands of a few individuals who, as they are human, may be governed not only by enlightened self-interest, but by greed, envy, jealousy, a desire for revenge, and so on. The transfer of the whole railroad business of the country to the Government would not obviate this difficulty. We should have, instead of a "pool," a bureau, and the members of a bureau are subject to other sinister influences quite as baneful as those of a pool. What the Government through its various agencies can do is to watch the operations of pools, make the rates they establish public, and prevent injustice, extortion, and discrimination, when it is proved (according to the usual rules of evidence) to exist.

The President has determined to appoint a Commission to investigate and report upon the charges made by European governments against the American hog. He has called upon the Chamber of Commerce to name one Commissioner, and it has named Professor Chandler—a very good selection. One is to be appointed by the Chicago Board of Trade, one by the President himself, and two by the Bureau of Agriculture. The matter has been already fully investigated, and there is nobody in the United States who believes that American pork is more dangerous to human life than the pork of Germany or the pork of France. Moreover, it is well known that our hog is excluded from European markets, though avowedly for sanitary reasons, really in order to protect the European animal, or rather the land-owner who raises him. The investigation will serve to strengthen the national faith in our hog, and deepen our distrust of European duplicity and hypocrisy; but even a mathematical demonstration that our pork is the best in the world will not help us, for what complaint can we make against any country for adopting a protective policy? Even should Bismarck be driven to the wall and forced to confess that he slandered the American hog, he will always maintain that if he practised deceit he did it in a good cause, and one that is recognized as good by our Government.

The Civil-Service Act provides that no Senator of the United States shall "*directly* or *indirectly* solicit or receive, or be in any manner *concerned in soliciting or receiving*, any assessment, subscription, or contribution for any political purpose whatever," from any employee in the civil service. Any violation of this section is punishable by fine and imprisonment, or both. The recent proceedings of Senator Mahone under this act are thus described by the Washington *Star:*

"General Mahone, a Senator, over his own signature, notifies men in Government service of his displeasure at their conduct. Their offence consists in the fact that they 'take no interest' in the Virginia Campaign Association, the objects of which are 'to promote, as well as it may properly, the success of the party on whose recommendation you [the Government employee addressed] have been given recognition.' Here is a direct reminder to the Government clerk that he is under political obligation for the place he holds. The association which Senator Mahone admonishes Virginia clerks to ally themselves with, supplements his circular with one of its own, warning the delinquent that unless his dues are paid up he will be 'summarily dealt with.' It is not the absence of Virginians from meetings that arouses the regret of the Senator and moves the association to action, it is the dues that are wanted."

This has not been contradicted, and unless it can be it appears to us that General Mahone has rendered himself liable to prosecution under the act. An immediate investigation of the case seems to be called for.

The resolutions adopted by the New Jersey Democrats on Thursday are far ahead of all the previous efforts of platform makers. If what they demand could be procured, the happiness of the American people would be so complete as to command the envy of the rest of the world. They wish to have the people taxed only so much as is absolutely indispensable for the frugal conduct of public affairs, with "not one cent for surplus, and no unnecessary taxation." The money not needed for the expenses of the Government "should remain in the pockets of the people." All internal taxation should be abolished; the dignity of American labor should be defended; such a tariff for revenue should be arranged as would be "limited to the necessary expenditure of the Government, and so adjusted as to give protection and encouragement to home-production, industry, and labor without producing or fostering monopolies"; there should be an "equalization of taxes," no "hindrance to legitimate enterprise," no "encouragement of monopolies," and all "government in the

interest of the whole people." When we add that a system of civil-service reform is demanded which will be so "genuine and deep-reaching" that only "honest, capable, and courageous public servants" will be put in office and will "faithfully administer their trusts," any one can see that the platform leaves little to be desired.

The framer of the New Jersey resolutions evidently proceeded on the curious idea that all the demands he was making were fiercely opposed by the Republicans, and that by putting them into the platform he would arouse the enthusiasm of the Convention. Instead of that being the case, the delegates paid no attention whatever to them when they were read, and went home in ignorance of what they had declared for. A similar indifference was manifested toward the speakers who dwelt upon the importance of "turning the rascals out." Senator McPherson's assertions that "loyalty to the Republican party means immunity from crime," and that the "people are awakening from their lethargy," were received with visible signs of weariness; and when the permanent Chairman attempted to give the delegates a second instalment of the same kind of information, they fairly howled him into silence by proposing "three cheers for the blatherer," and requesting him to "cut it short." They had gone to the Convention to nominate a candidate for Governor, and they were not in a mood to waste time upon the stereotyped accompaniments of that duty. Their conduct is instructive as showing that the party platform and party tirades of the period have lost their hold upon the politicians as well as upon the voters. The resolutions no longer mean anything to anybody, and rarely have any effect in the subsequent canvass.

The press has again been giving Mr. Wendell Phillips trouble by making the extraordinary charge that he has "changed his views" with regard to General Butler's reëlection. This statement is, he declares, a mistake. He has not changed his views; he wants Butler reëlected, mainly that he may lift from the State "the Republican incubus which weighs so heavily upon it." He declares that the Republicans are "soulless carrion masquerading in the grave clothes of their predecessors," and that he distrusts and despises them for it and hopes that they will be handsomely beaten by the gallant Ben. This letter, for some unexplained reason, attracts universal attention in Massachusetts, and is spoken of as if it were the utterance of some leading statesman "defining his position" on the issues of the day. There is certainly nothing in it to show that Mr. Phillips is changed in any way.

There was a little household murder at Trinity, Texas, on Tuesday, which afforded the town a pleasant day's excitement. Major Hurlock, a mill-owner, and a man of those strong natural affections which enlist the sympathy of the reader at once, had occasion to beat one of his employees, Roseman by name, who had accidentally hurt his child. Calling his eldest son to his assistance, the pair set upon Roseman, knocked him down, and were giving him some very effective punishment when he drew his revolver, disposed of young Hurlock by shooting him through the head, and wounded the Major. Feeling that all this might have disagreeable consequences, Roseman went up stairs and barricaded himself in; but on being asked by the "lady of the house"—presumably Mrs. Hurlock—to leave the premises, he very obligingly but imprudently did so. The mill-hands had now gathered on the spot, and as he retreated, they opened fire upon him, and after riddling him with "goose shot," easily secured him, whereupon the gallant Major, wounded as he was, again set upon and beat him, until the bystanders stopped the sport. Such incidents as these in the development of manufactures in Texas show that factory life in the new South promises to be very different from what it is in older parts of the country. There is a fine opening in Trinity for desperadoes and ruffians who desire to help in building up the State.

The only substitute for the duel that has ever been successfully introduced among civilized people has been that of arbitration by a disinterested friend, followed by a decision as to the merits of the case, and a reconciliation, if possible, of the parties. A most praiseworthy attempt has been made in Kentucky to introduce this sort of adjustment of difficulties, and apparently, too, among the very class that used to be most given to duels. The following is the history of the affair:

"Col. J. Stoddard Johnston has published a 'decision' in some of the Kentucky newspapers to the following effect: 'Certain personal differences having arisen between the Hon. J. C. S. Blackburn and the Hon. Ben S. Robbins, growing out of the Congressional canvass in the Seventh District about a year ago, and the same being submitted to me upon my solicitation, I hereby announce the following settlement of the same: Mr. Robbins having published a card animadverting upon Mr. Blackburn for words uttered by him in a speech which he regarded as reflecting upon him, suspends the same for a statement. The words at which offence was taken are declared not to have been intended as a personal reflection upon Mr. Robbins or an arraignment of his integrity, but as a discussion of his political action. Mr. Robbins therefore withdraws his card, and Mr. Blackburn withdraws any commentary he may have made upon the same, or expressions derogatory of Mr. Robbins. The cause of estrangement being declared to be removed, I decide that the difference between the gentlemen is honorably adjusted, and that they shall meet each other as friends.'"

How much better this is than if Mr. Blackburn had had to "slay" Mr. Robbins, or Mr. Robbins to fill Mr. Blackburn with "buckshot."

The first colony of immigrants from Germany to America landed at Philadelphia on October 6, 1683, and soon afterward settled at Germantown, which is now a portion of that city. Most of them were natives of the Rhine country, who left Germany to seek greater freedom of action in both religious and secular matters. The new settlement was made under the leadership of Francis Daniel Pastorius, who arrived in Philadelphia in August of the same year, and whose virtues Whittier has sung in his poem of "The Pennsylvania Pilgrim." He laid out the town in May, 1684, and obtained a charter for it in May, 1691. It is now proposed by the Germans in America to celebrate the bi-centenary of the original settlement, which occurs next month, with appropriate exercises, not only at Germantown but throughout the United States, as the beginning of the great movement of German immigration to this country. This proposal has drawn attention to the numerical strength of our German population, and many conflicting estimates are made of its dimensions. Unfortunately there are no accurate figures to base a calculation upon. The census returns afford the means for only an approximate estimate, and that which appears to be the most reasonable places the German-American element at about 9,000,000. The statistics of immigration have been kept only since 1847, and since that date, reckoning up to the 1st of August of the present year, the total number of Germans arriving at all the ports of the country has been a little over 3,000,000. Including in our American-German population all persons of German parentage, as well as all those born in Germany, the estimate of 9,000,000 is probably not too large.

The reduction in price of the New York *Times* from four cents to two cents per copy is the first decided symptom in American journalism of a movement which had its beginning in the penny press of London a dozen years ago. The abolition of the stamp duty and the cheapening of the cost of white paper made it possible for publishers in Great Britain to sell a newspaper of large size and of a high standard of ability at a price the equivalent of two cents in our money. The battle between the high-priced and the low-priced papers in London has been decided, as was inevitable if the low-priced ones should survive the perils of infancy, in favor of the latter. All the high-priced newspapers of London except the *Times* have been driven one by one to follow the example of the *Daily Telegraph* by reducing their price to one penny. The *Times* has held out so far, but at such cost in the way of circulation that it has latterly adopted the expedient of publishing a small sheet, called the *Summary*, at the price of a half-penny, in order to meet the intolerable competition of the *Telegraph*, *Standard*, and *Daily News*. The *Summary* is a condensation of the news and editorials of the *Times*, published at one-sixth of the price of the *Times* itself; and it remains to be seen whether it will have the effect intended by its inventors of driving the penny papers out of the field, or whether it will complete the work which the penny press has begun of driving the *Times* out of the field. Such contests are always slow in producing their final results. It would not be surprising if the result in this case were a reduction in the price of the *Times* to one penny, and the suppression of its subordinate, the *Summary*.

The course of English journalism has been watched with the deepest interest by all publishers of newspapers in America, and the conviction has been gaining ground that they must sooner or later follow suit. The *Sun* took up the same line of battle in New York when it began to give its readers, in condensed

but methodical and intelligible shape, all the news of the day, together with careful editorial treatment, for the price of two cents. Its success forced the *Herald* a few years ago to reduce its price from four cents to three. Since that time a new crop of cheap papers has come up — the *Morning Journal*, the *Star*, and *Truth* (one cent), and the *World* has lowered its price, first to three and latterly to two cents. The *World*, being a member of the Associated Press, was enabled to publish all the important news of the day at a price one-third less than that of the *Herald*, and at one-half the price charged by the *Times* and the *Tribune*. It was not, we presume, the competition of the *World* that decided the *Times* to reduce its price, but rather the general drift of journalism in England and America.

The sudden appearance of ten gorgeously-attired ambassadors from Corea "in our midst" appears to have caused considerable astonishment and bewilderment. The reporters who are detailed to meet distinguished visitors to our shores and describe minutely for the public edification their personal appearance, clothing, and manner of conversation, were wholly unable to cope successfully with the task imposed upon them on Monday. In the first place they were confronted with a national costume which completely paralyzed their practised powers of description. In the second place the ambassadors spoke a language which only two men outside the boundaries of Corea have ever been able to learn. Humiliating as it may be to American journalism, the confession must be made that neither of these two is employed by any of our esteemed contemporaries. As a consequence, the reception of the visitors by the reporters was much less brilliant than such affairs usually are. No "views" could be extracted from the ambassadors on any subject, and it is a positive fact that nobody in this great city knows what those distinguished observers think of our country and its institutions. This unprecedented failure in journalism has naturally bewildered the public, and there is much curiosity to know what the ambassadors are here for and why they wear such peculiar clothes. The object of the visit is mainly a friendly one. A treaty between Corea and the United States was signed about a year ago. The American ambassador who went to Corea to secure it was the second foreigner whom the King had ever beheld. The impression which a live American made upon his Majesty, who is kept so secluded that he is not even allowed to appear in public among his own people, was so favorable that a treaty was granted, and an incipient desire to have Corea thrown open to the outside world was much strengthened. A craving to behold more foreigners spread among the Corean people, and the women became so possessed with it that, although they are as jealously secluded as royalty, they could be seen by strangers peering from behind doors and stockades, trees and shrubbery. The present visit is an outcome of this popular curiosity to know more of the outside world, and especially more of American civilization. The ambassadors are high officials at the Corean Court, and other distinguished persons, who are fully capable of carrying back intelligent accounts of their observations.

It is evident that the recent victory of the French troops, under General Bouet, over the Black Flags between Hanoi and Sontai was as barren as it was dearly bought. That the French carried the enemy's works only after three days' hard fighting, at so short a distance from their own base in the delta of the Red River, shows what a task the reduction of the interior of Tonquin must prove to be, even should China be awed into the acceptance of an arrangement allaying all fears of an intervention on her part. General Bouet found it necessary to withdraw his forces to Hanoi immediately after the battle, in which no portion of the enemy (who are said to have numbered 4,000) was captured, though the works were taken by the bayonet. A despatch from Hong Kong of the 17th announces Bouet's arrival there, which is "believed to mean his removal from active command." The Black Flags again threaten the French outposts around Hanoi, and all aggressive warlike preparations on the part of the French are suspended until the arrival of reinforcements from Europe. At a recent Cabinet Council at Paris M. Challemel-Lacour is reported to have expressed his satisfaction with the course of his negotiations with the Chinese Ambassador. According to other reports, however, the Pekin Government is quite stiff in the assertion of its rights of suzerainty over Tonquin. M. Waddington, the French Ambassador to the British Court, is mainly active in the negotiations with the Marquis Tseng, and there are rumors of dissensions in the Cabinet of M. Ferry which may lead to the retirement of M. Challemel-Lacour from the Ministry of Foreign Affairs. The latter statesman has left Paris "for a few days' rest." Mediation, on the part of England or the United States, or both, is frequently talked about. Popular opinion in France is said to be strongly in favor of peace.

The latest despatches from China show that the Canton riot was the result of the hatred of the mob for the "foreign devils," and the natural sequel of the previous trouble arising from the shooting of a Chinaman by one of the foreign tide-waiters belonging to the imperial Customs. Threatening notices were, it was then stated, posted in the city with a view to intimidate foreigners, and this without doubt prepared the roughs of the place for aggressive measures, which they were not loth to adopt upon the occurrence of another personal affray—this time reported to have been caused by a Portuguese watchman killing a Chinaman. There are no wharves in Canton of any consequence, excepting the steamboat wharves, which are near the customs inspection shed, and within sight of the Custom-house; Mr. Woodruff, an American, being "Commissioner of Customs" at the port of Canton, and Mr. Holwill, also an American, his assistant in charge. From these wharves the Hong Kong steamers owned by British merchants or corporations leave twice a day, morning and evening. Their crews comprise Portuguese quartermasters, guards, deck-hands, etc. As Portugal has rarely a flag flying at Canton, it is more than likely that some of these Hong Kong steamers' crews are implicated in the last affair, in which case the contents of the buildings said to have been thrown on the wharves and burned or looted must have been foreign packages under Customs examination, with the personal effects of some of the Customs employees.

The foreign merchants reside on an island called Shamien, a concession to France and England, and occupied as such for the purposes of business. There are no wharves at Shamien—the place is stone-faced, with landing-steps, also of stone, for goods and passengers. It is connected with the main land or river front of Canton by two bridges, protected by iron gates, and no Chinese are allowed to make it a thoroughfare. The gates are only opened to foreigners or Chinese officials, and it is in no way a place which roughs could easily approach or attack, though the eastern gate is at no great distance from the Customs. There are no Englishmen attached to the Custom-house at Canton. Owing to some official squabble which a former commissioner—an Englishman—got into with a high Chinese mandarin, Inspector-General Hart, who is at the head of the department at Peking, ruled that Americans, French, and other nationalities should be represented to the exclusion of British subjects at that port.

No new outbreaks have taken place in Agram, or in any other large city of Croatia, since the restoration of the Hungarian escutcheons. The wealthier classes of the Croatian population seem to appreciate the danger to order, industry, and the general welfare of the country which lurked in the tumultuous movements begun in the name of patriotism, and soon after directed against Jews and landowners. The Hungarian Premier, Tisza, a week ago personally repaired to the Croatian capital, where he summoned a number of notables to an interview. The discussions were stormy, but, after lively recriminations on the part of the Croats, ended with their making loyal promises. In the rural districts, however, the disorders continue. In some parts, especially in the districts south of the Kulpa, formerly included in the Military Frontier, they show a violent agrarian character, and sanguinary conflicts have taken place between the rebellious peasantry and the military near Petrinia, on that river, and at Kostainica, on the Bosnian border. In the Zagorie district, between Agram and Styria, which was the scene of the first armed resistance to the troops, order has been restored. A disturbance in the eastern portion of Slavonia was easily quelled. The Hungarian Government evidently regards the repeated outbreaks with lively anxiety, and is bending all its energies toward suppressing them. It was, perhaps, very fortunate for it that the originally anti-Magyar agitation so speedily degenerated into a disorder threatening to the leading Slavic nationalists themselves, and proving the political immaturity of the rural populations of the Croato-Slavonian kingdom.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, September 12, to TUESDAY, September 18, 1883, inclusive.]

DOMESTIC.

THE second attempt to relieve the expedition sent out in 1881, under Lieutenant Greely, to establish a station at Lady Franklin Bay, has resulted in failure. The relief steamer *Yantic* returned to St. John's, Newfoundland, last Thursday, bringing word that her associate steamer, the *Proteus*, had been crushed in the ice, at the entrance of Smith's Sound, on July 23. When it was found that the *Proteus* must sink, all hands set to work throwing on the ice clothing, provisions, and other stores. The greater part of this property was lost, but enough was saved to insure the comfort of the officers and crew during their retreat south. They first directed their course to Cape York, with the thought that either the *Yantic* or the Swedish steamer *Sophia* might be there. On reaching the Cape there was no sign of either vessel. Proceeding further south, Lieutenant Caldwell, with one boat and six men, set out across Melville Bay, hoping to find the *Yantic*. Lieutenant Garlington, with the other boat and the rest of the crew of the *Proteus*, took a more circuitous route along the shore. Both boats reached Upernavik, and were there picked up by the *Yantic* and brought to St. John's. Great fear is now expressed that it will be impossible to get provisions to Lieutenant Greely and his men in time to save them from starvation. It is hoped that Lieutenant Greely will make his way south to some of the points at which provisions were left. Commander Wildes of the *Yantic* telegraphs to the Secretary of the Navy that it is useless to charter another foreign ship to go north, as the crew of the *Proteus* behaved shamefully at the time of the wreck, adding: "My plan is to buy a suitable sealer, take the crew from volunteers from the crews of the *Yantic* and *Powhatan*, now in this harbor, paying them extra compensation, Lieutenant J. H. Caldwell to command the ship; two ensigns and one engineer to be taken from those who may volunteer. From same ship also employ competent ice pilot here. The ship must be under United States laws and subject to military discipline." The Government has decided not to send out another relief expedition this year.

The Corean Embassy to this country arrived in this city from Washington on Monday evening, and were formally received by President Arthur at the Fifth Avenue Hotel on Tuesday forenoon.

The President has decided to name a commission of experts to make a searching examination of all the conditions of hog-raising and packing industries in the United States, and to follow out in their inquiry the course of this food staple from the fields and farms to the wharf where it is shipped, or the shop where it is offered for domestic sale.

Secretary Folger has issued a call for $15,000,000 3 per cent. bonds.

The total amount of money in circulation in this country on September 12 was $1,575,104,647. A per capita distribution would give each person $30 39.

The commission appointed by the Secretary of the Treasury to investigate charges that, under the treaty of 1875 between the United States and the Sandwich Islands, sugars not entitled to exemption from duties thereunder had been imported from those islands into the United States, has made its report. It does not find the charges sustained. It does find that the sugar output of the Island cannot exceed 100,000 tons per annum; that the industry is in the hands of German and English citizens or Hawaiians, and that the treaty has not created a sugar monopoly on the Pacific coast and increased the price to the consumer.

Postmaster-General Gresham says that he is studying carefully the whole question of a postal telegraph, and he confesses that thus far he has not reached any decision on the subject.

Naval Officer Nevin, of Philadelphia, has been informed by the Treasury Department that he cannot promote employees receiving less than $900 a year to clerkships which fall under the provisions of the new civil-service rules.

A letter by the New York Civil-Service Commission, explaining their classification of the civil service of the State, says: "The Commission decided to reorganize in the classification the great special departments of the public service by bringing into a single class the clerks wherever employed, into another the experts not attached to any great administrative institutions, and into another the non-experts not in such institutions. The last four classes represent all those other than the deputies and clerks employed on the public works and in the corrective and charitable institutions."

The Republican primary meetings in this city, held last Friday night under the new rule, which allows all Republicans to vote, brought out a few voters who do not usually attend such meetings. The vote, however, was light, and the delegates were mostly of the Stalwart class.

The New York County Democrats in this city have rejected the invitation to confer with Tammany and Irving Halls about arrangements for sending a united delegation to the State Convention. They insist that all the Democratic electors of the city shall attend the primary meetings held under the resolutions of the State Committee.

The New Jersey Democratic Convention last Thursday nominated Leon Abbett for Governor. The nomination is very distasteful to many Democrats in the State. The platform declares that the people shall only be taxed so much as is absolutely indispensable for the frugal conduct of their public affairs; favors the entire abolition of the system of internal taxation, and "a tariff for revenue limited to the necessary expenditure of the Government, and so adjusted as to give protection and encouragement to home productive industry, without producing or fostering monopolies"; and denounces "the sham methods of the Civil-Service Commission in its pretended examination of candidates for places."

The New Jersey Republican Convention on Tuesday nominated Judge Jonathan Dixon, of the State Supreme Court, for Governor. The platform congratulates the country upon the successful application of the principles of genuine civil-service reform in the national Administration, and favors the adoption of the system in all branches of the State Government; favors a protective tariff, and says: "We hold it to be one of the most imperative demands of the time that our system of State taxation should be so exactly equitable as to reach all corporations as well as all individuals."

Mr. Henry L. Pierce has written a letter declining positively to be the Republican candidate for Governor in Massachusetts. He thinks that some of his past political acts, and his known views on pending subjects, may prevent that united support of him which another candidate would receive. Representative Robinson will now doubtless receive the nomination.

Wendell Phillips has written a letter, denying the report that he is now opposed to Butler's reëlection. He says: "I distrust and despise the Republicans as hypocrites and time-servers, as double-dealers, as soulless carrion masquerading in the clothes of their honored predecessors." He adds: "I think Butler certainly ought to be reëlected; probably he will be reëlected."

Ex-Governor Hendricks addressed a large political meeting in Iowa on September 11. He denounced prohibition, said Mr. Tilden was not a candidate for President, and that in the adjustment of the tariff it becomes a question of infinite detail what shall be the charge upon each article taxed, and that "inequalities of burdens and monopolies should be prevented, and care taken that the industries of the country and the interests of labor suffer no harm."

The people of southern Dakota have been holding a Constitutional Convention in preparation for their admission as a State. This has caused much jealousy among the people of the northern part of the Territory, and they have passed resolutions denouncing the independent course of their neighbors. The District Court of the Territory has decided that the capital must remain at Yankton.

One of the principal witnesses before the Senate Committee on Education and Labor during the past week has been John C. Calhoun, a grandson of the famous South Carolinian, now a resident of Arkansas. He gave his opinion on the condition of the negro in the South, and told how colored laborers are employed and paid. He said that the relations between the small farmers and the larger landowners who employ them are friendly, and that there is little danger of strikes. He finds that the tariff bears very heavily upon the small landowners in that region, and that the race feeling is dying out.

The New York Railroad Commissioners have passed a resolution requiring all the railroad companies in the State to make quarterly financial reports.

The railroads between Chicago and Louisville are engaged in a war of passenger rates.

There has been a serious fight between ten prospectors and a band of Bannock Indians in Idaho. One Indian was killed and three were wounded, and of the miners three were wounded so badly that they were not expected to live.

Eight hostile Apaches attacked two men at a ranche at Antelope Springs, Arizona, last Sunday, and killed one of the ranchmen. The Indians are supposed to be some of those whom General Crook did not bring in from the mountains of Mexico. Their act has called out severe local criticisms of General Crook's peace policy.

There was a severe hurricane along the Atlantic coast last week. The Signal Bureau sent out timely warning, and no serious disasters occurred. The steamer *City of Atlanta*, from Charleston to this port, encountered the gale and sprung a leak, the water putting out her fires. She drifted for eighteen hours, when she was picked up and towed into Smithville, N. C.

The Italian steamship *Indipendente*, from Palermo, went ashore on the Long Island coast, near Freeport, last Thursday morning. She had a cargo of sulphur, lemons, and oranges, and there were on board 160 persons. The passengers were all landed safely, and the vessel was pulled off on Saturday.

H. Warner made a balloon ascension at Pittsburgh, Pa., last Thursday, going up hanging to a trapeze bar. When at a great elevation the gas began to escape. He climbed up into the basket, when suddenly the balloon partly collapsed, the envelope forming a parachute. This checked the descent, and in falling to the ground he was only stunned. His escape is considered a very remarkable one.

Hugh J. Hastings, editor and proprietor of the *Commercial Advertiser*, of this city, died on September 13.

Mr. Junius Brutus Booth, a well-known actor, brother of Edwin Booth, died at Manchester, Mass., on Monday evening.

FOREIGN.

The exciting event of the week in connection with the Tonquin difficulty has been the

news of a battle between the French forces and the Black Flags, between Hanoi and Sontai. French accounts say that on September 1 the French forces from Hanoi advanced to within twelve miles of Sontai, where the enemy was found in casemate forts, upon which the fire of the French had no effect. After three days' hard fighting the French troops, aided by a heavy fire from the fleet under Admiral Bouet, carried the enemy's works at the point of the bayonet, capturing two towns and two Black Flag standards. The French loss was two officers and fourteen men killed, and three officers and forty men wounded. The Chinese claim a victory. The French took thirty prisoners, who were beheaded forthwith. The result shows that very large reinforcements will be needed to clear Tonquin of the Black Flags, as an earthwork of no great strength kept the French, supported by gunboats, three days at bay. Warlike operations have been suspended until the arrival of reinforcements from France. The Black Flags are threatening the French outposts. Two transports now loading with troops for Tonquin at Marseilles have been ordered to hasten their departure, as General Bouet makes urgent demands for aid. The severity of the blockade of Tonquin has been so far relaxed as to allow vessels to proceed to their destination after being searched for articles contraband of war.

The Paris *Soir* gives the following as the heads of the proposals by the Marquis Tseng, the Chinese Ambassador, to M. Challemel-Lacour: That France shall cease sending reinforcements to Tonquin; that China will recognize the treaty of Hué, but will retain the right of investiture of the Anamese sovereigns; that the French protectorate shall be under Chinese control and under the direction of military mandarins; that China shall be reimbursed for all expenses incurred in the repression of the Black Flags. Tseng has expressed disappointment at the absence of any official proposals on the part of the French Government for the settlement of the question. He has said that China is determined to concede nothing concerning the suzerainty over Anam, as she does not wish France to possess territory adjoining the Chinese frontier. There is said to be a lack of harmony in the French Cabinet.

Much anxiety continues to be felt at Canton. It is considered probable that in case of another attack on the foreign Concession the Chinese troops on the gunboats there will make common cause with their countrymen. A hundred British soldiers are kept in Hong Kong ready for action in case of an emergency. The Chinese at Foo-Choo are restless and hostile to the Europeans. A British gunboat has been ordered to anchor opposite the Concession. The Chinese have posted placards on the walls of Canton, applauding the action of the populace and calling upon them to kill the Europeans at the next opportunity.

Germany, it is announced, will in no circumstances act as arbitrator between France and China. The report about a submission of the matter to England and America is positively denied.

The Paris *Union*, the organ of the French Legitimists, has ceased publication. Its farewell address says that the paper's mission ended with the death of the Comte de Chambord. It salutes the Comte de Paris as the head of the house of France, and hopes that he will restore to Christians the traditional monarchy. The cessation implies that the Legitimists will not support the Comte de Paris unless he claims the throne on the most absolute clerical principles, which is known to be impossible.

Captain Delaunay, a French infantry officer, who predicted four years ago that there would be an earthquake in Java, giving the date two days within its actual occurrence, predicts a worse disaster in 1886. The French Academy of Science has decided that this prophecy and its sequence were merely an extraordinary coincidence.

Baron von Manteuffel, military commander of Alsace-Lorraine, has issued a decree proclaiming that the use of the German language by the judicial and municipal authorities of Metz and Thionville shall be compulsory after January 1, 1884, as the use of the French language had been made to further an agitation for the restoration of Alsace-Lorraine to France.

A Paris correspondent telegraphs that there is reason to believe that the recent accessions to the Austro-German alliance will soon result in Germany issuing a proposal for a general congress of all the European Powers, with a view of determining upon a general disarmament.

The *North German Gazette* (Prince Bismarck's organ) denies that the Powers are irritated against Russia because of the recent events in Bulgaria. It says: "It is the dominant wish at Berlin, Vienna, and Rome to live at peace with Russia. None of the Powers desires war or anything else from Russia. No complaint is heard from any quarter, even from the Porte. The alleged irritation is purely imaginary, and due to the stories of sensation-mongers."

The *Journal de St. Pétersbourg* declares that should Prince Alexander, of Bulgaria, fail in the task appointed him, the peace of the East, and perhaps of Europe, will be imperilled.

It is said that the Czarina lately detected one of the imperial chamberlains in the act of placing Nihilistic documents in her apartments, and that he, fearing the consequences, committed suicide. New arrests have been made of officers of the Guards and officers of the Russian navy suspected of being engaged in Nihilist operations.

The Berlin *Germania*, an Ultramontane organ, says: "The Pope, acting in harmony with the Prussian bishops, has, without assenting in principle to the legislative enactments in regard to the education of the clergy, consented to grant dispensation for the past, and for this once only. If the May laws continue in force, a like spirit of toleration cannot be further exercised. Political sagacity should counsel the Government not to disappoint the confidence of the Pope, of which he has now given proof."

The disturbances in Croatia have not been settled. Herr Tisza, the Hungarian Prime Minister, has had a stormy interview at Agram with several Croatian notables whom he had summoned to an audience. The notables, after excitedly detailing the wrongs under which, they claimed, Croatia had suffered, promised to fulfil certain conditions proposed on behalf of the Hungarian Government, the details of which have not been announced. The *Pesther Lloyd* says that all indications point to the belief that the authors of the disorders are only the pioneers of a projected South Slavic agitation, which is to be directed, not against Hungary alone, but against the Austrian Empire generally. The military have again been compelled to fire into a mob with fatal effect.

The celebration at Wittenberg last Thursday of the quatercentenary of Martin Luther's birth was a great success. The doorway of the Augustine Monastery was flanked by Venetian masts. Colossal busts of Luther and Melancthon had been placed on the balcony of the Town Hall and on stands throughout the city. The Emperor's bust in front of the Town Hall was decorated with flowers. Portraits of Luther and mottoes from his sayings and writings were displayed in many windows. The number of visitors was estimated at 50,000. On arriving at Wittenberg the Crown Prince Frederick William, with Prince Albrecht and Herr von Gossler, Minister of Ecclesiastical Affairs, drove direct to the Stadtkirche and attended divine service. Over 1,000 clergymen filled the church. After the reading of the liturgy Superintendent-General Schultz delivered the festival sermon, taking his text from St. Matthew xxi. 42, 43. The royal party then proceeded to the Schlosskirche, where the Crown Prince placed a splendid laurel wreath upon Luther's grave. A general Catholic convention was held at Düsseldorf on the same day. The Ultramontane Herr Windthorst has proposed that an association of Catholics of all nations be formed, and that religious meetings to pray for Catholic unification be held on November 10 next, the anniversary of Luther's birthday.

A panic was caused in the theatre at Carlsbad on September 11 by a false alarm of fire. The doors were found locked. Many of the audience made their escape from the windows. Several persons were injured.

The International Literary Conference, which represents the principal countries of Europe, in session at Berne, has adopted a copyright convention to be submitted to the International Congress, which will be convened at Amsterdam on September 25.

The Congress of Commerce and Industry, holding its annual session at Amsterdam, has adopted a resolution declaring that the principal cause of the depreciation of silver is the decrease of its coinage in Europe, and expressing a wish for the adoption of a common double standard throughout Europe and America.

At a trades-unions congress in Birmingham, England, a resolution of Joseph Arch was adopted, declaring that, considering the large amount of waste land in the kingdom which is capable of cultivation, radical changes in the land system of the country are required in order that the land may be put under productive cultivation for the benefit of the community, thereby offering a check to excessive emigration. An amendment calling upon the Government to declare such lands Government property was rejected.

Mr. Parnell has paid off a mortgage on his estate amounting to £13,000 from the proceeds of the Parnell testimonial fund.

Mr. Davitt's recent speech in Ireland has provoked a chorus of disapproval in England. The Tory papers demand the revocation of his ticket-of-leave on the ground that his speeches contain rank sedition. Two more immense Home Rule meetings have been held in Ireland.

James McDermott, recently of Brooklyn, who was arrested on his arrival in England, has been discharged for lack of evidence.

O'Donnell, the murderer of Carey, the Irish informer, was landed at Southampton on Tuesday morning, and taken at once to Millbank Jail. He will be arraigned next Tuesday. Extraordinary precautions were used to prevent any attempt at rescue. It is said that Mrs. Carey has given important letters to the authorities.

A meeting of the supporters of Mr. Bradlaugh has resolved that at the next session of Parliament the House of Commons shall be given no rest until Mr. Bradlaugh is admitted to his seat or his legal disqualification finally determined.

The British Admiral, Sir Richard Collinson, who spent three winters in the Arctic region in search for Sir John Franklin, is dead. Also Dutton Cook, a well-known English writer on dramatic and art subjects, and Victor Alexander Puiseux, a famous French mathematician.

The directors of the Suez Canal Company have decided that after January 1, 1884, all vessels passing through the canal in ballast shall be entitled to a reduction of 2½ francs per ton. The company will also in future pay the cost of floating and restarting vessels that may run aground in the canal.

The Exchange Bank of Montreal has suspended, but is redeeming its notes, and its depositors will probably be paid in full.

STALWART EXULTATION.

THERE is something very extraordinary, and in fact almost inexplicable, about the exultation which the Stalwarts feel, and take no pains to conceal, over the fact that very few Republicans who were not Stalwarts came to the New York primaries last week—not more than a sixth according to the lowest estimate; not more than a fourth according to the highest. A full explanation of the general lack of interest in the primaries this year would involve a pretty complete review of the history of the city for the last fifty years, and of the causes which have led to the general abandonment of the primaries by the masses of both parties, and their conversion into clubs and even oath-bound close corporations of men who make a living out of politics. These causes have been at work in both parties, and have produced the same effects among the Democrats as among the Republicans. A year or two since, the more intelligent and public-spirited Democrats went to work to reorganize the Democratic primaries, by means of a very shrewd and elaborate plan. They did not content themselves with insisting that the Tammanyites should let them come to the primaries, but they invented a quasi-military reënrolment of all faithful and upright Democrats, which was designed to produce that feeling of public or, at any rate, party spirit, the absence of which is always complained of as the cause of the degeneration of the primaries. At first this scheme promised well; but it has not restored harmony to the party, nor has it made the Democratic primaries genuine representative institutions, nor has it done away with halls, or bosses, or the Machine.

Now, however different the two parties are in other respects, so far as regards the condition of the nominating machinery they closely resemble each other—that is to say, this machinery is in both in the hands of those who are "inside," and to it the great masses of the party are total strangers. Therefore it was only fair to expect that the work of reforming the primaries in both would be attended with much the same difficulties. The Republican primaries would to this day have remained in the curious condition to which Stalwart management brought them, had not the crushing defeat of the Machine ticket last year convinced the managers that the independent vote must be conciliated, or else they must face the alternative of remaining in control of nominations only to lose elections. The result of this desire to conciliate their opponents, and to make the nominations reflect the feeling of the whole party, rather than that of a mere faction, has led to the primaries being thrown open, and now they have been held, and yet the general control of them has remained in the hands of the Stalwarts as before.

Upon this the Stalwarts have begun to set up a great outcry at the demonstration they think it affords of the hollowness of the pretensions of the reformers, and are almost ready to dance for joy at the thought that they have not succeeded in getting the masses of the party to come to the primaries. When we reflect upon the work in which the Stalwarts are engaged, this is very singular behavior. What the Stalwarts want to do, as sensible, practical American politicians, is not to demonstrate the insincerity of those who insist that primaries ought to be open, and then stay at home when they are held; but to get some one to help them carry the load of responsibility under which they have lately been staggering. The Stalwarts are now simply a set of politicians who have been endeavoring to retain their hold upon the management of the party by a careful manipulation of patronage. They do not represent any ideas or opinions—except that Grant ought to have had a third term, and that Conkling is a great statesman, which are not now questions of any practical interest—and do not want to. What they want are the offices, and they are quite willing that the ideas and opinions over which elections are to be fought should be provided for them by the idealists and doctrinaires and reformers and other devotees of what they believe to be political humbug and cant. Provided they can keep control of the Machine, and nominate the next candidate for President, they are willing to profess to believe almost anything, even to throw up their hats for civil-service reform, and to let the party platform be drawn up by Mr. G. W. Curtis.

But the offices they must have, and they know from a very bitter experience that they will not get them unless they can make nominations which will not drive the independent Republican vote over to the Democrats. It was in the hope that they could entice the Independents into the fold, and get them to share in the work of keeping them in control, that they so liberally threw open the doors of the primaries; and if the Independents had gone to them in great numbers, and the result had been a State delegation representing the whole party, it would have been a great triumph. But they secured nothing of this sort. The class which it was for their interest to draw in refused to come, and therefore they find themselves left, just where they were before, in control of the Machine, but with the character of the Machine wholly unchanged. Singular as it may seem, this result appears to give them great pleasure, and they exult with the simplicity of savages over the refusal of the Independents to come to the primaries, as if it were in their own interest. The result furnishes really a very good reason for their feeling profound regret. In their delight they seem entirely to forget that the Independents retain precisely the same power at the polls that they have always had. They are not committed to anything; but hold in reserve the same power to defeat the Stalwart slate at the polls that they have had all along, and the exercise of which is surely though slowly disintegrating the Stalwart forces. As a collection of "leaders" their behavior is very funny, for, if there is one thing certain with regard to the next Presidential election, it is that the chance of any Stalwart's keeping his place at the public crib lies in his and his fellows being able to induce the party at large to work under them. Their delight, therefore, in the continued dissatisfaction with their management, manifested in the general distrust of their primaries, is as a matter of practical politics rather grotesque.

ROYAL SUCCESSION IN FRANCE.

THE Comte de Chambord had scarcely breathed his last at Frohsdorf when the various organs of monarchical opinion in Paris began to discuss the question of succession in a very serious tone. Almost all agreed that the Comte de Paris was to be in a certain sense his successor. The open questions were: Has he inherited a crown or a claim—a crown which belonged to the "Roy" by inalienable right, or a claim to be recognized and sanctioned by the French nation? Is Philippe Comte de Paris to be hailed as Philip VII. or as a future Louis Philippe II.? The organ of the Orleans Princes, the *Soleil*, remarked in an oracular way: "The Comte de Chambord was the last representative of the direct issue of Louis XIV.; but the race of Henry IV., the House of France, does not disappear with him. The elder line is extinct, the younger survives." The *Gazette de France*, *Clairon*, and *Gaulois* exclaimed in unison, "Le Roi est mort, vive le Roi!"—which meant direct legitimate succession. The ultra-Legitimist *Union* waited in silence for declarations of the Comte de Paris and of the spokesmen of the strictest shades of its party, and the *Univers*, the organ of extreme ultramontanism, declared its exclusive allegiance to the Church and France—that is to say, its opposition to any pretender who would not follow the lead of the Clericals. This declaration was violently assailed by the Duc de Broglie's *Français*, and the *Univers* was read out of the Royalist camp. The *Gaulois* christened Chambord's heir Philip VII.; *Figaro* objected to this name as an emblem of reaction.

Not many days after the death of the last French Bourbon, placards, signed by Deputy Pieyre and two others, were found posted in Paris and elsewhere, calling upon the nation to rally round "the new sovereign," Louis Philippe II., "the direct heir of Henry V." They were torn down by passers-by and the police. At the same time the *Soleil* published a declaration signed by M. Édouard Hervé, which had all the appearance of emanating from the Comte de Paris's most intimate circle. The latter's visit to Frohsdorf in August, 1873, it asserted, had restored the unity of the royal families; his second visit, in July, 1883, had restored the unity of the monarchical party. This restored unity was a great gain, but more was needed. It was not enough to have one royal family, one monarchical party. This family and this party must go before the country, and ask to be accepted by it. No government could be founded apart from the national will. The country must be appealed to, the cause of monarchy pleaded before it, and thus won. Monarchy was not yet restored: it was only restorable. This declaration was followed by another from the same pen referring to the placards, which stated: "On that day only will there be a king when the nation shall have accepted monarchy. The Comte de Paris is the representative of the right of inheritance, but he must also be the representative

of the right of the people. Thus his legitimacy will be twofold. In a country like Great Britain, where monarchy exists, the tacit consent of the nation is sufficient. In a country in which monarchy has been overthrown, a manifestation of the people's will is needed to reëstablish it. As long as this manifestation is wanting there is an heir to the throne, but there is no king."

This double exposition of liberal Orleanist views was received as a manifesto by the Comte de Paris, who had gone to Frohsdorf to participate in the "Royal" funeral. He was obviously to be a pretender, but a legal pretender. His supporters were to pave his way to the throne by victories won at the polls; and a legal revision of the Constitution, such as the Radicals also demanded, was to crown their triumph. A general plébiscite might follow, giving a final sanction. The allusion to an appeal to the people, the favorite ultimate resort of the Bonapartists, frightened and almost dismayed Paul de Cassagnac, who made haste to warn his party, through the *Pays*, that Imperialism was in more imminent peril now than ever before. For a moment, however, he seemed to counsel submission to the strongest enemy of the Republic, whether Bonapartist or Orleanist, urging Prince Napoleon to give the Clericals guarantees of his return to religious sentiments and of true allegiance to the Concordat, and the Comte de Paris to cast off with contempt the liberalism of his family and declare war on all pernicious liberties. This veering around of the Bonapartist bully appeared to some like a trap set for the Comte de Paris, whose abjuring of liberalism would undoubtedly become as fatal to his pretendership as was, ten years before, the declaration in favor of the white flag to the claims of Chambord. But the Orleanists were not to be caught in this way. Prince Jerome Napoleon, too, was vainly conjured by Cassagnac to come forward with a saving act; neither the *Pays*'s return to himself and ignoring of his son, Prince Victor, nor its shrieks of despair in view of the threatened Orleanist plébiscite, could induce him to exchange his attitude of silent observer of the doings of the Royalists and their princely chiefs. The *Soleil* reiterated its opinions, and the *Français* and *Gazette de France* made them their own.

A sudden ray of hope for despondent Imperialism came from Frohsdorf. There the Orleans Princes had been received with cordial distinction, and their chief, the Comte de Paris, with royal honors. They, too, did their duty as behooved pious Christian cousins of "Henry V.," kneeling and praying at the side of his catafalque. In spite of all this, however, the devout widow of the last "son of St. Louis," who probably never shared the charitable feeling of the deceased in regard to his cousins' standing within the Catholic fold, and was now led by the advice of her spiritual guides, at once announced her resolution to assign the posts of honor at the funeral according to the degrees of relationship—that is to say, the Comte de Paris, the recognized head of the House of France, was to follow the Royal bier at Görz after Don Carlos, the ex-Grand Duke of Tuscany, the ex-Duke of Parma, and the latter's brother, the Comte de Bardi. The slighted grandson of Louis Philippe immediately left Frohsdorf. Thus there was a feud in the Royalist camp. Confusion rapidly followed fusion, as Rochefort expressed it in the *Intransigeant*. But the exultation of the Imperialists did not last long. The action of the pretender's widow was condemned by all the leaders of Legitimists and Orleanists assembled at Frohsdorf; and at Görz, on the day of the funeral, several groups of French Legitimists, including such names as Larochefoucauld-Bisaccia and Charette, held meetings and adopted resolutions in favor of the Comte de Paris as successor of the Comte de Chambord. Thus the confusion again gave way to complete fusion. Another mark of acknowledgment of the legitimacy of the Orleanist aspirations was found by the *Soleil* in the Emperor Francis Joseph's visit to the Comte de Paris during the latter's stay at Vienna, even before the Comte had made his appearance at the Burg.

THE ART REMAINS OF ATHENS.—II.

In front of the Central Museum is a bit of open field, with grass and mallows and asphodels growing and blossoming freely, and herein are ranged in rows many marbles of secondary or tertiary importance—parts of sarcophagi, broken slabs bearing inscriptions, and many gravestones of different forms. Besides these, half-a-dozen large and fine-sculptured slabs lie about in the sunshine or are propped against the guardian's little house, awaiting promotion. Clearly it is meant that they shall be taken into the Museum building, but things move slowly. Meantime it is not thought that the weather will hurt them, for the finest of these tombs are definitively set up out of doors, two miles away, at a point where outside the gate of Athens began the sacred way leading to Eleusis. Here excavations, made by the Archæological Society of Greece twenty years ago, and some more recent, have resulted in the discovery of many sculptured tombstones of all sizes and degrees of importance. Those that are set up as nearly as possible in their old places (and, of course, generally near where they were found) form a gathering of extraordinary interest. They are better here than inside a museum, just as the sculptures of a great building are better in their places in its walls, than elsewhere. To protect the larger and more showy of them against the missiles of the idle, they are boxed around with woodwork and wire gratings, but an old woman, expectant of a few lepta, unlocks these.

Immediately in front of the spectator, as he enters the enclosure, is the largest tomb-relief yet found (Sybel, 3312), with an inscription on its base, in fair, large, unusually neat capitals, setting forth that Dexileos of the Thoric province and son of Lysanias, was one of the five Athenians of knightly rank who fell at Corinth. The war and the Athenian expedition of 394–3 were the scene of Dexileos's last exploits. In the Museum we have already seen the crowning member of the huge state monument commemorating these slain soldiers: here we have his family's tribute to one of them. This magnificent monument is worked out of a thick slab of marble about ten feet high and five wide. At top a very simple pediment-shaped coronal and at bottom a plain square base are left projecting, while the whole width of the slab between is sunk, without pilasters or frame of any sort, leaving the figures in high relief on a panel five feet by six. A scene in the battle is represented, a mounted warrior trampling down a fallen foe. As the figures fill the panel completely, touching top as well as bottom, they are nearly of life-size; for the horse, besides being of the same breed as those of the Parthenon frieze, is slightly emergent from the field, offering his breast to the spectator, and is therefore foreshortened. Holes in the marble show where the lance and helm (or wreath) of the cavalier, the sword of the fallen man, and the reins and head-stall of the horse were all supplied in bronze; and, as the hair of the cavalier is very simply massed, it must have been hidden by the missing head-dress. The fallen man is nude except for a little drapery gathered around his left arm, within the shield which, thrown behind him, partly surrounds his figure with its disk. But the mounted man is dressed in his girded chiton, perhaps over-elaborately draped, while his mantle floats behind him and fills that part of the background with carefully-arranged decorative folds. It is evident that we cannot form a clear conception of the effect of the work when the many metal objects were added. Were they all gilded? and was the whole relief painted? As we have it now, in spite of its great and unintended simplicity, the elaborate and refined modelling satisfies the eye and fills the marble full of interest and artistic value. Another splendid monument is here (Sybel, 3343), a great alto-relief of two ladies, Demetria and Pamphile. Usually these memorial reliefs represent other persons in company with the dead, servants who attend them—children, parents, spouses—and very puzzling their presence and actions are; but in the example before us no one is present but the two ladies, one of whom sits in a rich chair with (as usual) a foot-stool, the other standing by her. The special charm in this fine design is the realistic drapery—a beauty common to many of them, to be sure, but in this case the dress is more elaborate than usual, with full mantles and veils for the head, and is most skilfully disposed, the art, one thinks, having concealed the art more than in the last instance.

It should be well understood how different are these sepulchral monuments, with their life-size figures, high relief, and naturalistic treatment, from the Greek sculpture of which the treatises have more to say and which are better known to students. It is because even recent books on the subject of Greek sculpture allow too little space to their consideration, that it seems important to call the attention of art-students to their peculiarity and value. The archæologists, and especially the German monograph-makers, are not open to any such reproach: the sepulchral monuments of all sorts are in the way of receiving their due from those patient students.

In the depositories upon the Acropolis the sculptured slabs are of a different character. There are no memorials of the dead there, but votive tablets, commemorative records, and architectural reliefs proper. As one goes up the winding way and passes the gateway in the Turkish fortification (soon to be entirely removed, if promises are kept), a small and low-roofed house of rough stone is found in a corner. The old soldier at the gate unlocks it, and one finds a bare interior, with floor of shifting sand and two little traps for windows, through which, however, is had that unequalled view of sea and mountains identified with the memory of Athens for all those who have once seen it. On shelves about the room are the smaller fragments—the smallest behind wire doors; the larger pieces rest upon the floor and are propped against the walls, while two low screens support the less-injured and more valuable reliefs. There are about thirty of them, all but three or four votive tablets to the god of medicine and the

goddess of health. The largest are, or were when intact, three feet six inches in width and rather less in height. The subject of most is uniform: Asklepios is seated as a bearded man, Hygieia, standing with hand and arm raised, leans slightly upon a pillar of the roof, and the human worshippers, made smaller as befits their inferiority, bring animals for the sacrifice and offerings for the shrine. The variety of grouping and composition is, of course, endless. Against one end of the screen leans the stone (Sybel, 3999) erected in testimony of the treaty of the year 375 between Athens and Corcyra—an upright slab once some four feet high, now broken off below. The terms of the treaty are sculptured on one face in crowded lines of inscription, and above this is a rough but interesting bas-relief about sixteen inches high by twenty wide. A draped woman stands for Corcyra; a bearded man seated on a stone must be for Athens (the *Demos* perhaps, as Sybel suggests), and Pallas Athene, fully armed, presides over the alliance. Another memorial is of the treaty between the Athenians and Arcadians (Sybel, 3989, treaty of 362 B. C.), and this is even more interesting than the last, as the inscription is beautiful in itself, and the sculpture, in flat relief in a sunk panel, very delicately designed: Zeus enthroned, and Pallas standing with spear and shield but without the ægis, are accompanied by a goddess who evidently appears for Arcadia; but it is not easy to name her. Another small bas-relief represents our *Demos* again as a bearded man clasping the hand of Athene (or, putting something into her hand ?). The long inscription that follows, partly broken away, has to do with the treasury of the goddess, and was, perhaps, a schedule or inventory.

There are 800 different pieces in this hut, of which 100 or more are still of value as works of art. Out-of doors, piled against the rock that rises above this court, and against the Turkish walls, are larger fragments, but few of them of importance. Some sculptures of the Byzantine epoch take the eye more than anything else here. Upon the table-land above, on top of the rock, and to the east and south of the Parthenon, is a one-story house which was built in the time of King Otto and Queen Amalia, especially to contain the objects discovered upon the Acropolis itself. It is still used for that purpose. It is of considerable size, perhaps 150 feet long, and contains ten halls and chambers, all as bare and plain as possible, and floored only with sand or loose pebbles, but sufficiently lighted (except one room), dry, and a safe enough place of storage. Here, however, the lack of guardianship is even more marked than at the Central Museum. As this collection is opened to the public only three times a week and for short hours, an especial guard is thought less necessary, and one sees instances of reckless mischief on the part of idle visitors. But, as for the contents of this unpretending repository, they are so varied and so precious that but a feeble attempt can be made to describe them.

The largest room contains casts of the Elgin sculptures in London, but mingled with them are marbles from the Parthenon; and especially noticeable are the panels or slabs of the cella-frieze, of which Athens preserves a number. Lord Elgin took to London nearly all that was not wholly ruined of the sculpture of the pediments and of the metopes, but of the frieze he left as much as he took, partly in the temple itself, partly hidden under Turkish buildings long since removed, and rubbish now cleared away. The explosion of the Turkish powder-magazine blew to pieces the centre of the temple, leaving the two ends less completely ruined: the west end, especially, still carries its capitals and architraves in place, and there the whole frieze remains, except a bit at the northwest corner, namely, twelve large slabs, and one small one in the west end itself, and parts of three others adjoining, on the south side. In the Museum, besides very many fragments, there are a dozen or more large slabs, and of these seven from the north side and one from the east end are in sufficiently good order to delight us still as most exquisite works of art.

The slab from the east end has sculptured upon it a group of the gods, seated, receiving the procession of their worshippers that comes flowing up the north side and southward along the eastern end: fortunately this slab is in peculiarly fine condition. Of the slabs from the north frieze, two have oxen and sheep for the sacrifice with their attendants, and these come near the head of the procession; then an exquisite group of youths bearing amphoræ; then a number of the elders of the people, though here some wantonness or bigotry has shattered the heads; then a magnificent scene of chariots and men in vigorous action; and finally two sets of the gallantly prancing, high-actioned horses, ridden bare-backed by stately, unarmed, slightly-draped youths—the procession of horsemen, in short, which is the most familiar part of the famous frieze. The west end frieze, which still remains in its place, is entirely occupied with horses and men who are preparing to join the procession of the north face.

To speak of the value of these sculptures would be like recommending a copy of Shakspere and one of Dante to a person forming a library. And yet, so many persons form their conceptions of Greek sculpture from casts, often inaccurate, generally soiled and injured, and always cold and hard in the surface and color, which but poorly represent the living marble, that it is right to call attention to the wonderful beauty of the originals. I wish that our people could see more of fine sculpture; or, more accurately, that they could see *some little* fine sculpture, without leaving home. The art is more simple than painting; to care for it and to get intense pleasure from it requires less technical training; many minds and eyes are so constituted as to enjoy pure form even more than the combination of qualities which great paintings contain; and yet it cannot be denied that sculpture is generally assumed to be a comparatively uninteresting art. Still, I can imagine no path to the wonderful pleasure that is to be found in loving art for its own sake so direct as the loving study of shattered antique sculpture.

Room V., at the end of the building, contains many different things. On the shelves and on the floor are slabs from the famous parapet of the Temple of the Wingless Victory. The temple itself, having been thrown down hastily by the Turks to make room for fortifications, was set up again during King Otto's reign, and of the sculptured frieze about half is in its place, though much shattered. The other half is in London, and terracotta copies replace it in the rebuilt temple. But no attempt was made to restore the parapet, made of large slabs of marble forty inches high, which prevented falling from the dizzy point where the temple is perched. This is most richly sculptured in a style curiously different from that of the Parthenon frieze, although later by only a quarter of a century. It is sad to find how little of it remains. No idea of the complete frieze nor of the sequence of its subjects can now be formed—even Herr Kekulé's careful analysis falling short of that. A few figures of winged Victories, posed in attitudes of active motion, and exquisitely draped, remain for our study. This Room V. contains also a few reliefs from the Erechtheion, and fragments of large and fine votive sculptures, and, in a glass case, small objects of clay and bronze, as well as recently discovered *colored* sculptures, of which a few words below. The next room (VI.) has several sculptured bases for statues, sculptured with designs of unusual character, as where (Sybel, 6154) five athletes are found scraping themselves with strigils, with various contortions; and (Sybel, 6149) another with six figures of dancing women of great variety of attitude and gesture. Here, too, is a valuable archæological document (Sybel, 6148), a flat relief of a trireme, from which study may suffice to evolve further explanation of a troublesome subject. In Rooms VII., VIII., IX., and X. are inscriptions, and in Room I. some most important pieces of archaic sculpture, large statues as well as reliefs, among which is the remarkable statue (Sybel, 5005) of a manly figure bearing a calf (or bullock ?—it has rather the form of the full-grown creature, and we may well assume the bearer to be divinely gigantic), called Hermes Moschophoros, and also Theseus, and by various other names.

Even as we study this museum, or choose among its fourteen hundred objects those which it is most important to study, digging is going on outside, and new discoveries are being added to the contents of the building. Since first the Turkish houses were swept off the Acropolis, exploration has gone on intermittently, but now it is proposed to go down to the living rock everywhere, and to bring to light whatever of value successive ages have deposited among the earth and rubbish of successive fillings-up and gradings.* Rejected drums for columns and rough boulders seem to have been thrown in together to bring up the ground to the desired level of the pavement eastward of the Parthenon, but among these have been found a number of pieces of painted sculpture of altogether exceptional importance.

The discussion of the practice of the Greeks in painting their buildings and sculptures, though always going on, is always very languid, from lack of material with which to build theories. The total number of pieces of worked stone partly colored is small; usually the traces of color are faint and slight; usually, too, the color passes away rapidly, leaving almost invisible permanent markings, if any. It is therefore to be regretted if, as seems to be the case, no means have been taken to record the discoveries of painted marbles under the surface-soil upon the Acropolis. The bright red lips and darker red hair of a discovered bust fade and pass into a feeble orange during the few weeks following its discovery; the blue falls in powder; the green, of which there is much on the dress, may perhaps prove somewhat more permanent; but the rapid and complete disappearance of most of the colors is shown by this, that there are so many pieces here upon which there are patterns traced, apparently in *white*, and many more where the design is partly in faded red and partly in white. Now this white, showing vivid and opaque like chalk, in contrast with the mellow color of the remaining surface of the marble, is merely the white marble which has been protected during centuries by the coating of paint which has fallen off since it has been brought to light.

In a very archaic relief in coarse Pirræus stone, the flesh of the charioteer has been colored red, the beard and hair black, the reins red. In another archaic relief the whole background is red, but no trace of color can be seen on the seated figure. A fragment of a relief bears the head and neck of a most vigorous serpent, vivid green; but in the inequalities of the stone are seen crumbling touches of cobalt blue, which cause the question to be asked, Can it be that

* The work was stopped again in April, 1883, owing to some disagreement among authorities, but it will hardly be abandoned altogether.

this was all blue, but turned green? On one marble fragment the head and bust of a female statue of archaic character, but of great beauty, are irregular blotches of red which have been interpreted to be remains of a general covering color—to mean that at least the whole garment on which they occur was red. I think this belief to be erroneous. The patches of red seem to be rather accidentally gathered, as if by contact with another fragment, perhaps the charioteer mentioned above. But at least one case occurs in which the whole surface of a garment has been colored *green*. This is a most curious and valuable statuette of rather less than half the scale of life, discovered not long ago among rubbish and earth of the filling east of the Parthenon. The eyes and hair are colored; also the ear-rings and a fillet around the head. The outer garment, very elaborately disposed in folds, is decorated with a diaper pattern, of which the unit is a simple rosette in black and red, and this garment has most elaborate borders, which follow all its edges, and are painted skilfully enough in and out of the numerous folds worked in the marble; but the ground is the uncolored marble itself. The chiton, or undergarment, is exposed at the upper part of the breast and the whole left shoulder and arm. This has a curious, stiff-looking collar, decorated with a fret in red, and from the collar a broad band is carried along the shoulder and down the outside of the left arm, and decorated in red and black. All the rest of the chiton has been colored emerald green over its whole surface, the color still showing in all the crevices and recesses, for the surface had been left by the sculptor in little zigzag ridges, to imitate the crapy, crinkly stuff. This is a wonderful find, and it and two others here give us more that is new about Greek coloring of sculpture than any recent discoveries of which I have heard. Unhappily, before these words can be read in print the colors will have faded, and, when another winter brings the students to Athens, little trace of them will be left.

RUSSELL STURGIS.

CHAMBORD AND MONARCHY IN FRANCE.

PARIS, September 1.

THE universal emotion caused by the illness and death of the Comte de Chambord shows that he had a greater place in the heart of the French people than could be imagined. He was to some, though unseen and personally unknown, an object of affection, to some an object of aversion. His importance can only be felt now that he is no more. He acted as a hidden yet powerful spring on all the political forces of the country, and his withdrawal creates a general perturbation. His figure has to some extent become legendary; he was a type, and a type which has become almost a miracle in our age. All the actual sovereigns of Europe believe in their rights, but they look upon these rights as historical rights. There is one thing which time only can create—viz., a dynasty; but where is the sovereign who has not been obliged to reconcile dynastic with popular rights? In England, it is impossible to forget Charles I. and the Revolution of 1688; King Alfonso of Spain has seen his royal title contested by Don Carlos; the King of the Belgians is the creature of a popular revolution. Conspiracies and assassinations have had a strange part in the history of Russia. The Emperor of Germany likes to speak of Providence, but he has singularly aided Providence: he is covered with the spoils of war, and his Empire is only of recent date. The King of Italy was, not long ago, the King of Piedmont; he has not respected the divine right of the other sovereigns who ruled in Italy—in Naples, in Parma, in Modena. The Emperor of Austria, who, more than any other ruler in Europe, may presently be tempted to confound his traditional rights with divine right, has received terrible lessons from war and from revolution, and he has finally assumed the position of a constitutional ruler. Wherever we look, we see sovereigns who, while they assert some rights founded on tradition or history, accept the modern principles of constitutional government. Their function seems to consist merely in giving continuity to the executive power, and to taking it out of the strife of vulgar every-day politics. In this sense, they play a national part, as a nation has a continuous life which is independent of the accidents of party.

The Comte de Chambord alone took another view of the royal office. He had completely inspired himself with the doctrine of divine right; his ideal was a sacerdotal monarchy, in which the king was, so to speak, the priest of God. You will find this theory set forth in a great work of Bossuet's: 'La Politique tirée de l'Écriture sainte.' In the eyes of Bossuet, the sovereign was the man chosen by God to guard the people against all errors. The only order now on the breast of the Comte de Chambord in the chapel where he lies exposed is the order of the Holy Spirit. The Count sincerely believed in the doctrine of the holy mission of kings; the doctrine of popular sovereignty seemed to him as great an error as the doctrine of the unlimited perfectibility of man would appear to a strong Calvinist, to a believer in the total depravity of human nature. Constitutionalism is a sort of compromise between traditional right and popular government; it is a very necessary compromise, as the work of the past ought never to be suppressed with violence. But constitutionalism seemed to the Comte de Chambord a mere hypocrisy; he was not willing to accept a constitution imposed on him by any popular assembly. It was for him, he thought, to frame the articles of the constitution, and he never disguised his belief that the last word in any dangerous crisis must always remain with the king. This was in reality the cause of the failure of the monarchical attempts of 1871; the apparent cause was a letter written by the Comte de Chambord on the question of the flag, when he said that he would never come back to France if not under the white flag. But flags are only symbols; the white flag was in his eyes the emblem of an unpolluted royal power, of the principles which were the contradiction of all the principles of 1789. What was the tricolor flag to him? It had made the "tour du monde," as Lafayette prophesied that it would, but it was a flag of rebellion and sedition; it did not speak to him of the hundred victories won by the French armies at the end of the last century and in the 19th century; it reminded him of the fate of Louis XVI. and of Charles X. The divorce between the Comte de Chambord and modern France was complete, and he preferred not to reign rather than to belie his conscience.

After the war of 1870, when France was prostrated at the feet of Germany, there was an instinctive return toward the old monarchy. The Legitimists, who had been almost forgotten during the Second Empire, took an honorable part in the defence of the country, and, in the first moment of her distress, France turned to them. The monarchical movement was so intense that the Comte de Paris felt obliged to go to Frohsdorf. His patriotism was superior to his pride; he told the Comte de Chambord that if France wished to return to the monarchical form of government, he would not stand in his way; he would not accept a crown if it was offered to him. This conduct was very much blamed by the old Orleanists, who, during the reign of Louis Philippe, had found themselves in constant opposition to the Legitimists; they felt as if the Comte de Paris abandoned the traditions of 1830, as if he were a traitor to the principles which Louis Philippe had represented on the throne. It is certain, nevertheless, that the Legitimist party was so strong in the Constituant Assembly that the Orleanists alone could never have carried a separate policy against the combined efforts of the Legitimists and of the Republicans. The only chance of the monarchy at that time seemed to be in what was called the fusion; this chance was destroyed on one side by the Comte de Chambord, when he rejected the tricolor flag, and on the other side by M. Thiers, when he joined more and more openly the Republican side. The Constituant Assembly had given him almost unlimited power; he was its trustee. He promised, in a famous speech, to be completely impartial between the various parties; his part, he said at Bordeaux, was not to give a Constitution to France, but to heal its wounds, to make peace with the conqueror, to reorganize the army and the administration. He did not long remain impartial; when he saw that the chances of the monarchical solution were becoming stronger, he lent all his force to the Republicans. He had found them in an abyss of despair and defeat; he gave them the benefit of his immense popularity, of his prestige, of the services which he had rendered to the country. One of the great mistakes of the monarchical party lay in the fact that they would not proclaim a monarchy at once, because they dreaded for the new monarchy the unpopularity of the treaty of Frankfort; they hesitated, again, when the Commune was in arms, and when Paris had to be taken by siege: was it for a Bourbon King to fire on his "bonne ville de Paris"? was it for him to give away to the enemy French provinces which his ancestors had given to France? Certainly it was. France was grateful to Thiers because, in her hour of agony, he did not hesitate, and pause, and wait till the unpleasant things to be done had to be done. The function of a government, its highest function, is precisely in these services rendered to a nation; in politics, he who puts on the napkin eats the dinner. The poor monarchists wished their king to be as pure as a dove; there was not to be a spot of blood on the ermine of his mantle. History is not a sentimental novel; it requires determined people, who are willing to work when the work is necessary.

I have always been convinced that the instinctive movement which drew the people toward the monarchy cooled from the moment when they perceived that there was no ardent, no immediate, no instinctive response. The restoration was treated as a bargain when it ceased to be a sentiment. Many years have passed since; new generations have sprung up on the political field, and it is very difficult to say how they will now be affected by the death of the Comte de Chambord. When the Constituant Assembly, feeling in the end that the restoration of the Comte de Chambord had become an absolute impossibility, drew up a sort of Constitution, it made laws which are called Constitutional Laws, in virtue of which a total revision of the existing machinery of government can be made. M. Dufaure was Minister of the Interior at the time; and he distinctly asserted that the revision had no limits; if there is a majority in favor of a revision in both Chambers (and the majority need not be more than one), the two Chambers meet in Congress, and this Congress assumes de facto constituant rights; it can even alter the form of government and substitute the Monarchy for

the Republic. The monarchists of the Constituant Assembly would not have voted for the Constitutional Laws without this clause of total revision: they established the Republic as a sort of cover under which they could wait for the Monarchy. But such calculations often prove incorrect. The Republic has committed many mistakes: it has, without provocation, assumed a hostile attitude toward the Church; it has laid an indiscreet hand on time-honored institutions; it has created an uneasy feeling in Europe by its colonial policy; it has been more the government of a party than a national government. But it has, on the other hand, the almost overpowering force which belongs in France to all established governments: it has enlisted many interests, many ambitions, it has magnificent prizes for any man who merely proclaims himself the enemy of what it fears or hates; it has an acquired velocity which cannot be checked, except by unforeseen and tremendous forces. Since the death of the Comte de Chambord, monarchy is again becoming a possibility; but who can tell if this possibility is a probability, or can ever become one? The future of France is dark, and so is the future of Europe. The Third French Republic, which has thus far made *bon ménage* with kings and emperors, may be drawn into a policy of propagandism and of revolution; and there are symptoms already which tend to show that the calculations of those who have favored the establishment of a republic in France have not been quite sound. You can give a rope to a man in the hope that he will hang himself; but if he does not hang himself? The Republic needs to be cautious, and moderate, and, in many senses, conservative; it also needs statesmen and not politicians. It has the advantage of possession; it can only lose it by great faults and by unpardonable mistakes.

THE MIRACLE OF LORETO.

ALASSIO, August 15.

THE Italian Government has put a good deal of money into the effort to make Ancona an important seaport. The town, too, has brushed itself up for business, and with its new harbor—a station for the main steamer lines to the Levant and the further East—it stands ready and waiting for its great commercial future. But commerce is coy, and during a great part of the year Ancona lies broiling under the sun on its semicircle of hills, reflected in a sea like molten glass, whereon the rare steamer spends its few hours

> "As idle as a painted ship
> Upon a painted ocean."

For all that, Ancona is not a dull place; it has a cheerful air, and the streets have the swarming activity of the south. It has also plenty of objects of interest. On the highest point in the city stands the cathedral—an attempt, as at Pisa, to fuse the Italian art of the twelfth century with that of Byzantium. In the streets that scramble up and down the hillsides are two or three rich church façades of good architecture. The Loggia de' Mercanti, at present the least noisy of exchanges, has one of the finest fronts produced by the Middle Ages in Italy. Enter here: the frescoes of Tibaldi and the view of the bay from the balcony are things to be seen. There is, moreover, at one end of the town an arch of the time of Trajan, and a rococo papal arch at the other end. The list could be made longer, but the great sight of all—one, it is said, that yearly draws more than half a million visitors—takes us away from the city.

Some sixteen miles of the richest corn and vine land, adorned everywhere with the fine old trees that are commoner on the Adriatic coast than in most parts of Italy, stretch away southward from Ancona to where Loreto crowns the brow of a steep hill. The domes and the prominence of the huge episcopal palace give the city the air of an enormous fortified convent. Its aspect seen from below is as imposing as its fame. The road winds slowly up the hill, makes a few turns through an ordinary enough Italian town, and brings you face to face with what may fairly be counted as one of the wonders of Europe. You come out upon a broad piazza, two sides of which are taken up by the noble arcades of the Palazzo Apostolico, while the third is filled by the front of the church built over the *Santa Casa*—the house in which the Blessed Virgin was born and wherein the youth of our Saviour was passed. There is nothing remarkable about the outside architecture of the church, but a fine bronze statue of Sixtus V. sits at the head of the flight of steps before it, and three doors of bronze of great beauty (showing of what even second-rate men were capable in the noble days of Italian art), open to the aisles within.

I may as well say at once that Loreto makes such extraordinary claims upon belief, presents contrasts so astounding, aspects so dissimilar and irreconcilable, tends so strongly either to revolt or to subjugate the reason, that there is no question here of a sufficient account of the place: I merely borrow a few scraps of so-called history from the 'Relazione Storica delle Prodigiose Traslazioni della Santa Casa di Nazarette ora venerata in Loreto,' and supplement these with my own notes made on the spot.

It was the Empress Helena, mother of Constantine the Great, who discovered the *Santa Casa*, as well as the true cross, in her famous pilgrimage to the sacred places of Palestine. She identified the house at Nazareth partly by its narrowness and meagre appointments, but chiefly by a certain holy dread that it inspired. She caused a basilica to be built over it, and inscribed upon the façade: "Hæc est ara, in qua primo jactum est humanæ salutis fundamentum." The basilica was visited and revered by uncounted thousands, until its destruction in the final conquest of Palestine by the Saracens. The sacred house, however, was not allowed to perish with its enclosing shrine. In the night of the 10th of May, 1291, it was borne by angels to a spot in Dalmatia between Tersatto and Fiume, where its divine origin was immediately recognized (1) by a statue of the Virgin and child and a painted crucifix, both done by St. Luke; (2) by an altar at which St. Peter had said Mass; (3) by various relics of the Holy Family and of more recent piety; (4) by the same nameless dread that had convinced the Empress Helena; and (5) by the fact that, unsupported by any foundation, it still stood firm and level on uneven ground. The identity of the house was finally established by a commission, which went to Palestine and found by careful measurements that the original foundations tallied exactly with the dimensions of the structure in Dalmatia.

It is said that Tersatto attracted large numbers of pilgrims, and that the value of their pious offerings was great; yet after about three years it was concluded, we are not told by whom, that the house might be even better placed. On the night of the 10th of December, 1294, the angels again took up their sacred burden and deposited it in a wood not far from the present Loreto. The wonders and verifications of Tersatto were repeated, but the site was even worse chosen than before. The riches of the pilgrims attracted robbers, who murdered and pillaged with impunity under the protecting boughs of the wood. A third miraculous translation to the top of a neighboring hill resulted in a deadly feud between two brothers, joint owners of the land, and was followed by a fourth translation, which, till now, has proved final. The angels must have been sadly tempted to make a fifth removal when the French soldiery in 1797 stripped the sacred house of the plates of gold with which it had been lined, and despoiled the treasury of inestimable riches. But the wisdom of their reserve has been well proved, as the generosity of the faithful in this century has already made up in great measure for the losses of the past.

The fact that this extraordinary demand upon faith has been increasingly met during six hundred years, sufficiently shows the superiority of belief to reason in human nature. The knees of pilgrims have hollowed the marble base that surrounds the holy shrine, their kisses have polished the bricks of the walls that witnessed the denunciation. Nor are they alone the obscure and ignorant who come here to worship. The greatest saints of the Church—popes, sovereigns, the noble and the good—have knelt and wept upon the stones that modern unbelief regards, perhaps, with a cheap sneer. Fine ladies left here their diamonds, the rich made offerings of gold and precious stones, until a treasury of immense value was accumulated, which, dissipated in 1797, has in our century grown again to wonderful proportions. Upon the room and the cases which contain these gifts the Cardinal Anton Maria Gallo spent more than a quarter of a million dollars. The superb church, with its beautiful bronzes, its altar-pieces of mosaic, its rare marbles—indeed, the growth of the entire city of Loreto—must also be accounted as tributes to the shrine.

But richest of all the gifts is the setting of the Holy House itself, which stands immediately under the great dome of the church. Within, where behind ever-burning lamps the statue of the Virgin stands covered from head to foot with a blaze of diamonds and precious stones, the sacred walls are exposed in all their primitive rudeness. But outside, the whole is sheathed in finest marble, every available inch of which is sculptured by the most cunning hands of the *cinquecento* period. The design was Bramante's, the execution by Sansovino, Tribolo, Rafaelle da Montelupo, and others enumerated in the 'Lives' of Giorgio Vasari. The reliefs are among the finest achievements of the Renaissance in the way of story-telling in marble. I know of nothing to be compared to them except the similar works, in part by the same men, in the Chapel of St. Anthony at Padua. Granting the objection that some of the motives, even some compositions, are borrowed from the paintings of Raphael and Michael Angelo, the execution, the feeling for beauty, characteristic of the times, mark these as masterpieces. This from the artistic point of view; but there is another point of view which here especially must be taken. Sacred history and tradition supply the subjects of the reliefs, the statues are of the prophets and sibyls, but the spirit that shaped the whole was that neo-paganism to which Olympus was much nearer and more real than Calvary. The names of Jeremiah, David, Isaiah, Amos, are given to beautiful statues which suggest, however, no thought answering to the names. Disbelief, or rather belief in alien ideals, informs every graceful line, and gives an air of unreality to each character, each sacred scene represented. And such is the force of art that the ideal which shaped the false prophets becomes here the real thing, and the story of Nazareth retires gradually back into the regions of myth and fable.

The art of the Renaissance has been so often characterized as pagan that the sentence has become one of the commonplaces of art criticism; but at Loreto, as I believe in no other place in Europe or the world, is the opposition of its spirit to that of Christianity forced into a vividness of relief that is appalling. Within the

shrine the rude walls, the narrowness of poverty suggest the sublime ideal of self-renunciation that is the essence of Christian life. In such a house the Saviour might have dwelt, and the claim of the Church, that this is the most sacred spot in Europe, does not shock the devout soul. Even the diamonds that glitter on the statue of the Virgin do not offend; they witness to the power of faith in a way that may be mistaken, but is at least understandable. Three steps, however, bring one out under the dome, and there the fair casket of the shrine rises before you, embodying in every relief and statue the joy of human life, and mocking the self-abasement and ecstasy awakened within.

The revulsion is complete, and it is unhappily strengthened by other circumstances. The prominence of the boxes marked *Elemosina* forces the conclusion that the faith that comes there is expected to show itself at once in works. In justice, I may say that no more direct appeal to your pocket is made, except by the dwellers in Loreto. Nowhere have I seen beggars more ferociously determined. They follow you into the church, they frantically rush between you and the picture, the bronze or marble you would look at, with a manner that strongly suggests "Your money or your life." So, too, the dealers in rosaries, scapularies, sacred images, who importune you at every step till you recall in wrath the proverb, "The nearer the church the further from God." The baleful influence of piety extends for miles over the country. The children leave their play and run shrieking, wailing, chanting after your carriage, always with the name of the Virgin on their lips, and the promise of a prayer if the soldo be extorted. This is the more noticeable as beggary is rare elsewhere on the Adriatic coast (except at Ravenna), and it gradually dies away as you lose sight of the towers of Loreto.

After the church, the palace is the only thing to be seen. The façade consists of two stories of open, arched galleries, the upper rather squat in effect, the lower (by Bramante) of simple and noble proportions. Within, there is only to be remarked—aside from the wonderful views that open from every window over the country between Loreto and the sea—the collection of pharmacy majolicas, one of the most important in Italy (a gift of the last Duke of Urbino), and the tapestries after the Hampton Court cartoons of Raphael. These the local guide said were by Rubens, "Celebre pittor francese," as he explained.

There were no American names on the hotel register that we turned over while waiting for dinner, except two or three with the title *sacerdos* appended, and one Italianized enough to sign himself *prete*. For good or for ill, Loreto seems unknown to our country-people; that fact is the excuse for the fulness of detail in which I have indulged in this letter.

Correspondence.

THE DEGREE OF PH.D. AT THE BONN UNIVERSITY.

To the Editor of The Nation:

Sir: The Note in to-day's *Nation* (p. 229) concerning the frequency with which the degree of Ph.D. *honoris causa* had been granted by the University at Bonn, seemed so completely at variance with my observation during a long residence at that University that I immediately turned to Dreyfus-Brisac's 'Étude.' The table given by him (p. 122) fully confirms the statements made by the Philological Association as to the infrequency of honorary degrees in philosophy at the best German universities. During the sixteen years covered by this table (1861-77, *not* "the last sixteen years") this degree had been conferred 316 times upon examination and only 32 times as an honor. Of these latter, 18 belong to the academic year 1867-68, when, as Dreyfus-Brisac is careful to note, the semi-centennial celebration of the foundation of the University took place. On that occasion the University granted 55 of the 105 honorary degrees quoted by the Board of Regents of the University of Michigan as degrees in philosophy, but being in fact the entire number of honorary degrees during the sixteen years in question. The other large number, 760, is a similar mistake, it being the number of degrees in all the faculties for the same period. If a table could be made giving the names of those to whom these honorary degrees were granted, I have no doubt a still better showing would result. J. W. W.

Boston, Sept. 13, 1883.

THE GREEK QUESTION ONCE MORE.

To the Editor of The Nation:

Sir: In the late discussions upon the compulsory study of Greek in our universities, and consequently in many of our schools, is not the treatment of the subject too special? The question is not whether Greek or any other study shall be given up (we cannot afford to curtail knowledge in any direction), but whether education shall be placed on the broadest basis; whether, in short, any one study, be it literary or scientific, shall exclude or dictate terms to any other.

The present system of admission to college, based upon a prescribed examination in which the greatest prominence is given to the ancient languages, certainly reacts most unfavorably upon the preparatory schools. In conformity with this system, any boy who is intended to enter college is obliged to spend the best six years of his school-life in acquiring an intimate familiarity with the Latin and Greek grammars—a process certainly more stimulating to the memory than to the other faculties. Any one who doubts this statement need only refer to the printed programmes of some of our best schools, where boys are fitted for college. History, except as connected with the study of antiquity, physical geography, all information concerning the world about us, all development of the powers of observation, are omitted, while exercises in Latin and Greek, with mathematics, make up the bulk of the instruction, to which is added some slight modicum of English studies and a smattering of modern languages. This monotonous and restricted course of study is forced upon the schools by the universities. The doors of the latter are practically closed to the sons of all parents who do not accept their exclusive system. The consequence is a half-hearted adhesion to the universities, because, on the whole, one clings to the idea of an Alma Mater, or else, as an alternative, the boy is sent to get his general education in one or other of the technical schools.

It is vain to say, in answer to all this, that mental training is only to be acquired in the study of Latin and Greek. The common sense of any man who is in contact with the increased knowledge of the age and the problems it is called upon to solve, rejects the narrowness of this definition of education. Education and classical learning are no longer strict equivalents—the one overruns the other in countless directions; and nothing less than absolute equality in the choice of the requisites for admission to college, and freedom in the subsequent instruction, will satisfy the present demand for an intelligent development of all the faculties with reference to their greatest proficiency.

Two practical pleas are often urged by the advocates of the older and more exclusive system of education. The first is, that without the prescribed classical training a boy is not ready, when he comes to the university, to decide for himself between a purely literary career and any other, it being then too late for him to begin his Latin and Greek. But surely some idea of the literature and such familiarity with the languages themselves as will enable a young man of eighteen to decide whether he will pursue them further, may be given without a six-years' technical drill to the exclusion of other subjects. The second plea is, that the nomenclature of science demands, even in that field of knowledge, a careful training in the ancient languages. This latter statement is certainly misleading. A tenth of the time now devoted to Latin and Greek in our schools would give any student of nature a sufficient command over the nomenclature of his subject. The other nine tenths would perhaps be better employed in a study of the things themselves rather than of their names.

Shall we, therefore, give up the study of Latin and Greek? Surely not. Let them only bear a fair proportion in our systems of education. Let them yield the predominance which custom and tradition have given them, and which, in the present state of knowledge, threatens to make them an obstruction to progress. A. A.

THE BRITISH PARCELS POST.

To the Editor of The Nation:

Sir: In your amusing article on "British Enterprise," in the issue of August 16, it seems to me you are under a little misconception as to the nature of the progress made in the institution of the Parcels Post and as to the existing status.

At the time the new post went into operation, the railways carried on a parcels express almost identical with our express business, only a good deal cheaper, the rates for small articles for short distances being very similar to, or even less, than the Parcels Post's, so that it is still cheaper to send parcels for short distances by railway. The railways do not collect from houses, but they send parcels by passenger train, and deliver to within a mile of the railway stations (and further, I believe, in the larger towns), and they are responsible for the value of parcels up to £30, and insure on larger amounts for a small consideration.

The step in advance made by the Parcels Post consists in reducing the rates on long-distance despatch of parcels under seven pounds, and in extending the delivery to all points covered by the house delivery of letters, which is carried into much more rural districts than with us. You are probably aware that the closed-letter postage approximated our merchandise post by means of the sliding scale of increasing weights. Thus, while one ounce costs one penny, twelve ounces could be sent for fourpence, and larger amounts *pro rata*.

Apropos of railways, there is one consideration which should be taken into account in comparing English freight tariffs with our own, especially for short distances, and that is, that the railways deliver to the consignee at his residence or shop.

In your mention of Continental parcel posts, you ought not to have neglected little Switzerland, whose extraordinary facilities in that way were of the greatest convenience to me on foot tours, when I used to send my trunk to any desired point by post.

Too much cannot be said about the extraordinary backwardness of the Briton to reform his baggage arrangements. He has adopted or tried

most other American notions in railway management, and you occasionally see an admiring item in the papers about the amount of luggage despatched over American railways without loss; and yet his railway manager cannot seem to bring his mind to the use of "brasses," as the British tourist in America calls them.

Yours respectfully, W. HOWARD WHITE.

COMMERCIAL HOTEL, HARROGATE, ENGLAND, September 2, 1883.

THE STRAW AS A SIGN OF CONTRACT.

TO THE EDITOR OF THE NATION:

SIR: You were good enough, some time ago, to notice with commendation my little essay on the straw as a sign of contract, in which, among other matters, I mentioned that men formerly stood with straws in their shoes as a sign that they were ready to be engaged as witnesses, and to testify whatever was required of them. Some doubt was cast upon this by a subsequent correspondent, who thought that the men of straw confined their operations to offering worthless bail, and did not make a profession of perjury. I am sorry that I cannot give the exact reference to this letter, but I think the above fairly represents the writer's argument. I therefore ask you to find space for the following quotation from the *Quarterly Review* of 1825:

"We have all heard of a race of men who used in former days to ply about our own courts of law, and who, from their manner of making known their occupation, were recognized by the name of Straw-shoes. An advocate or lawyer who wanted a convenient witness, knew by these signs where to meet with one, and the colloquy between the parties was brief. 'Don't you remember . . . ?' said the advocate. 'I'o be sure I do,' was the instantaneous reply. 'Then come into the court and swear it.' And Straw-shoes went into the court and swore it" (vol. xxxiii., p. 344).

This, I think, justifies the statement in my paper, which, with some additions and corrections supplied by writers in the *Nation* and elsewhere, will appear in a volume of 'Cheshire Gleanings' which I have now in the press.

WILLIAM E. A. AXON.

FERN BANK, HIGHER BROUGHTON, MANCHESTER, ENGLAND.

MR. JARVES AND MR. STILLMAN.

TO THE EDITOR OF THE NATION:

SIR: That Mr. Jarves should retort on my letter with personal abuse neither surprises nor concerns me. We have both been long enough before the public to have our comparative positions well understood. In any question of veracity, those who know us both will have no difficulty in deciding which of us is to be believed, and I declare with all the solemnity the matter is worth, that Mr. Jarves's version of the Michael Angelo incident is utterly false. He brought the bust to my studio carefully wrapped up that no one should see it, and told me in so many words that he had found a bronze repoussé bust of Michael Angelo, which he believed to be original and unknown. I saw it to be an electrotype at once, and said so to him, at which he appeared a little stupefied, and said, "Do you really think it is electrotype?" I showed him the granulation of the interior surface, which he had never noticed or understood. If my affidavit will strengthen this statement, I am willing to make it. I afterward introduced the bust in a sketch I was making of him, because I knew that it pleased him to be associated with Michael Angelo, and for my purpose the electrotype was as good as an original. He had a Michael Angelo "craze" at the time, and had bought a poor brown-stone statue from some villa-garden near here, under the full persuasion that it was a Michael Angelo and was destined to make a noise in the world. All Florence knows this, and laughed at it, and later he dropped the subject. He has twice brought me bronzes he had purchased as antique which were gross counterfeits, and at his request I carried one to Marchese Strozzi, who is (what I am not) an expert in that branch of archæology, who confirmed my bad opinion. In fact, there is a term in use by some of the dealers in bric-à-brac—"roba di Jarves"—which means a particular kind of rubbish which they can pass off on nobody but Jarves. All these things are of common knowledge in Florence. His terracottas I believe to be "roba di Jarves," but I am not an expert, and Florentine counterfeits are too much even for the experts sometimes.

I have had no personal quarrel with Mr. Jarves, and will accept none. I believed him honest and well meaning, and stood by him in Florence mainly because I believed him maligned; but from the time when as editor of the *Crayon* I noticed his "art-hints," I never concealed my opinion that he was utterly incapable of forming a valid opinion on any work of art. I may be no better, but at least I have studied art diligently more than thirty years theoretically and practically, in order to qualify myself as an art critic, and I hold this to be my vocation, if I have one—hold it conscientiously and as a moral obligation, and never wittingly allow personal feelings to bias my judgments, and have always the courage of my opinions.

Those who know the art literature of America during the past twenty-five years, know the nature of my opinions and the extent of my qualifications, and as a believer in the *Nation* as by far the weightiest agent in art-culture we possess, as a contributor who values the privilege of being such beyond any other literary connection, I considered it a duty to protest against such careless criticism in its pages as that which talks of Mr. Jarves as an art critic; and this I did, not with any pleasure to myself, but with reluctance, and because, in the state of æsthetic cultivation we are in, long persistence in keeping one's self before the public as a writer on art matters makes even incompetent people authoritative. I shall protest at every opportunity against such abuses of the facility of printing. It is impossible for public taste to grow on such pabulum as Mr. Jarves offers it, and I consider it the duty of every man who reverences art to expose its worthlessness. One thing I wish Mr. Jarves to understand: that I do not class him with General di Cesnola or with Doctor Schliemann. The Doctor is a man who spends his fortune in the gratification of an archæological enthusiasm, and for this deserves respect; he has no qualities that I know of in common with the General and Mr. Jarves, nor do I see anything in common between the latter two. Will Mr. Jarves, by the way, quote what I have told the world as to Doctor Schliemann's being an "egregious charlatan"? As to General di Cesnola, I have heard Jarves express opinions of him as bad as any I ever have published. It seems not to be always true that *cœlum non animum mutant qui trans mare currunt*.

Yours truly, W. J. STILLMAN.

FLORENCE, August 30, 1883.

Notes.

FORDS, HOWARD & HULBERT will issue shortly 'A Sylvan City: Quaint and Picturesque Corners of Philadelphia, Old and New'; 'Judith: A Chronicle of Old Virginia,' by Marion Harland; the 'Housekeeper's Year-book for 1884,' by Helen Campbell; and five volumes of 'Historical Lectures,' by Dr. John Lord.

Mr. Matthew Arnold's approaching visit to this country is to be commemorated by Macmillan & Co. in a very pleasing manner, viz., by a new and uniform edition of his prose writings in seven volumes. These will embrace Essays in Criticism; Study of Celtic Literature, On Translating Homer; Culture and Anarchy, Friendship's Garland; Mixed Essays, Irish Essays; Literature and Dogma; God and the Bible; St. Paul and Protestantism, Last Essays. The style will be elegant and companionable with the "Eversley Kingsley." It should be added that this edition is manufactured expressly for the American market, and is the first and only uniform edition. We hope that the success of it will warrant its completion with a volume (or volumes) of Mr. Arnold's poems, which have a steady appreciation in this country. The same publishers have in preparation a new edition of Mr. Henry James's 'French Poets and Novelists,' which has been for some time out of print.

Further announcements by Charles Scribner's Sons are: 'The Merry Adventures of Robin Hood, of Great Renown in Nottinghamshire,' done into prose and illustrated by Howard Pyle; 'Quotations in the New Testament'—from the O. T. and from other sources—by Prof. C. H. Toy, of Harvard College; a translation of Paul Janet's 'Theory of Morals'; 'The Agnosticism of Hume and Huxley'; a new volume in Doctor McCosh's "Philosophic Series," and 'The Cottage Kitchen,' by Marion Harland.

The following are among the fall announcements of Funk & Wagnalls: 'Wall Street in History,' by Mrs. Martha J. Lamb; Oehler's 'Theology of the Old Testament,' edited by Prof. Geo. E. Day, of Yale; 'The Thoughts of John Foster,' collated and arranged by the Rev. W. W. Everts; 'By-Ways of Literature,' by President Wheeler, of Allegheny College; and 'A Manual of Revivals,' by G. W. Hervey, M. A.

The new paper of the week is the (monthly) *American Journalist*, of St. Louis, intended as a means of professional intercourse, and "to aid the unknown, unseen stars of the press, who scintillate through the editorial and miscellaneous pages of the great newspapers, and whose sparklings give greater luminosity to the central light that controls the editorial pages." Portraits of some of these central lights adorn the first number.

Swinton's Story-Teller is the title of a new weekly periodical about to be edited by Mr. William Swinton. It will consist exclusively "of choicest *complete* tales—from four to six in each issue."

A valuable "Synopsis of Copyright Decisions," by Mr. W. M. Griswold, of the Copyright Office, appears in the *Publishers' Weekly* for September 8. The arrangement is alphabetical by topics, as abridgments, advertisements, announcement of copyright, etc. The Synopsis may also be had separately (New York: J. W. Christopher).

Mr. Charles E. Pratt gives a very readable sketch of Pierre Lallement, the inventor of the bicycle, in the October number of the *Wheelman*—the first of its third volume, by the way. A portrait of this still young Frenchman and numerous other excellent illustrations accompany the article, including a curious representation of the Draisine velocipede, which became a passing fashion in Boston fifty years ago.

The contents of the illustrated Catalogue of the Art Exhibition of the New England Manufacturers' and Mechanics' Institute (Boston: Cupples, Upham & Co.) do not warrant the great expectations excited by its luxurious get-up. The collection of autograph drawings, etchings, and photogravures fails, in other

words, to meet the aim of the managers "to show by it the status of the culture and intelligence of American Art in some of its most important phases as it exists to-day." It is by no means fairly representative, as a list of names omitted would show. Sometimes, we are told, the drawings submitted have been dropped "because the good of the artists was considered"; and even "the drawing of others known to be excellent was something deplorable from an art-catalogue standpoint." Short papers on various phases of American art follow the mostly uninteresting and mediocre series of designs.

The "Mound-builders" have acquired such a hold on the popular belief in their existence as a prehistoric people quite distinct from the red men known to us for the past four centuries, that no one can find fault with the length of Mr. Lucien Carr's essay on "The Mounds of the Mississippi Valley, historically considered," in vol. ii. of the Memoirs of the Kentucky Geological Survey. Entire candor, studious fairness, and a wish to leave no objection unanswered determine the form of this discussion to be principally negative. It proves untrue the assumptions that the red Indian was not an agriculturist; that he did not worship the sun; that he did not build mounds, or if he did, that these were different in kind and object from those of which the largest examples occur in the Mississippi Valley. The contrary is demonstrated with a particularity and a wealth of historical citation and reference which make this essay, as far as it goes, a very valuable and readable conspectus of Indian usages. The conclusion is irresistible, "that the mounds and enclosures of Ohio, like those in New York and the Gulf States, were the work of the red Indians of historic times, or of their immediate ancestors." There is much suggestiveness in the remark, incidental to the inquiry how far the male Indians "labored," that among Continental nations having large standing armies "it is no exaggeration to say that labor, using that word in its broadest sense, is left to the women far more completely than it ever was among the Indians."

The fall season opens with the usual number of new editions. That of Emerson's works (Boston: Houghton, Mifflin & Co.) may justly first claim attention. Two volumes have thus far appeared; 'Nature, Addresses, and Lectures'; and 'Essays —First Series.' The first contains the epoch-making address before the Cambridge Divinity School in 1838, with sundry orations and addresses delivered between the years 1837 and 1844, and a very interesting early portrait engraved after a daguerreotype by S. A. Schott. The second volume contains the twelve essays beginning with History and ending with Art—which last, by the way, closes with a sentence that recalls the latest novelty on the Thames: "The boat at St. Petersburg which plies along the Lena by magnetism needs little to make it sublime." The workmanship of this elegantly simple edition is what we expect from the taste that presides over the publications of the Riverside Press.

Charles Scribner's Sons have likewise issued the first two volumes of their promised new edition of the works of Donald G. Mitchell—'Reveries of a Bachelor' and 'Seven Stories, with Basement and Attic.' Five more of the reprint will follow ('The Lorgnette' not among them), and then three or four will be made of fresh material, embracing a series of essays embodying results of studies in English history and literature, and observations of travel; in other words, the experience to be drawn upon is still largely foreign, as in the earlier writings, even if no longer in that consular vein worked also by Hawthorne and by Howells. In comparison with the Emerson volumes just noticed, these, in heavy drab-colored cloth covers, with rustic gilt letter-stamp, are neither so fair without nor so excellent of print within. The typography is nevertheless open and pleasing to the eye, especially in the 'Reveries.'

The same firm send us a new edition of Dr. Selah Merrill's 'East of the Jordan,' which is apparently unchanged in any particular, and remains an attractive and very readable book.

Henry Holt & Co. have become the publishers of Mrs. E. S. Miller's 'In the Kitchen,' which has now been for nearly a decade held in high household estimation. The author has added some receipts and, what is better, an index.

So long as the plates of the juvenile works of the late Jacob Abbott afford a passably legible impression, we shall doubtless see reprint after reprint from them. Their new proprietors, Thomas Y. Crowell & Co., put forth the six volumes of the Jonas Library, the same number of the Lucy Library, the fourteen volumes of the Rollo Books, and the eight volumes of American History—the latest and the most certain to be superseded. Those addressed particularly to the nursery age are in no danger of losing their hold on the young; the others are better adapted for reading aloud, whether to explain the long and hard words which the author was not careful to avoid, to enlarge upon his moralizing, or to point the contrast between old times and the present. For adults, indeed, the interest of these writings is largely historical and archæological, even to the woodcuts, which range from Bewick to Hammatt Billings and Darley. Very antiquated, too, seems the first volume of the American History (1860), which begins with disputing the Darwinian view of the origin of species, and ends with the dictum (ostensibly apropos of the Indians, but with a secret application to the blacks), that "the feeling of repulsion that exists between the different races of men is not necessarily a prejudice," but is in fact a Divine appointment. The story-books we should be sorry to see disappear from circulation, but some of the plates call loudly for repair.

Mr. Lowis D'A. Jackson, the author of several works designed to aid engineers and surveyors, has published (London: W. H. Allen & Co.) a volume of tables of five-figure logarithms of numbers from 1 to 99,999 and of the trigonometrical functions, sines, cosines, etc. The latter tables are constructed according to the French metrical system, the quadrant being divided into 100° instead of 90°. The peculiarity of these tables consists in the fact that the last figure of the logarithm is marked with an accent in such a manner as to give an indication of the value of the rejected part of the logarithm. It is well known that with ordinary logarithmic tables, in order to obtain results true to any given number of figures, we must use tables containing one more figure than the result desired. Thus, to be sure of the correctness of our calculations to five figures we must use six-place logarithms. Mr. Jackson maintains that his accented five-place logarithms, while avoiding all use of differences and proportional parts, will give results to five places with as much accuracy as six-place tables. His plan, for an explanation of which we must refer to the book itself, is very simple, and it appears to be practical. The only way to decide this point is by using the tables. The system is, however, so simple and so easily learned, that we should think it well worth the while of those who have to make much use of logarithms to give it a trial. The tables are very neatly printed, the mantissa of every logarithm being given in full to five places.

The series of 'Célébrités Contemporaines' (Paris: Quantin; New York: J. W. Bouton) continues, and a new brief biography appears every week. M. Jules Claretie contributes most of the more literary portraits, the latest being that of M. Ludovic Halévy, the inventor of *La Grande Duchesse de Gérolstein*, *Froufrou*, and *Criquette*. M. Claretie's own biography has been prepared by M. de Cherville. M. Ernest Daudet is now writing the sketches of MacMahon, Broglie, d'Aumale, and the Comte de Paris.

It is proposed that the Paris Société Historique et Cercle Saint-Simon shall publish from time to time inedited documents of French history in a uniform manner. Each issue will constitute a *feuillet mobile*, capable of being inserted in its proper place in any historical series, or given to the printer without inconvenience. Thus, the sheet will be about 10x6, sized to allow of writing upon it, printed only on one side, and in two columns, with the necessary information as to the origin of the document. Each *feuillet* will fetch two centimes, and each volume (of 250) five francs—a calculated profit for the Society of two francs.

M. Louis Cattreux, a Belgian lawyer, has just published a treatise on stage-right. In this 'Étude sur le droit de propriété des œuvres dramatiques et musicales' (Brussels: Larcher; New York: F. W. Christern) the writer discusses not merely the copyright of dramatic and musical works, but especially the right of performance and of execution—in short, the stage-right, which is wholly different from the merely literary copyright, and which indeed is capable of being altogether separated from it. Although M. Cattreux devotes himself more particularly to the legislation of France and of Belgium and to the agreements between these countries, his arguments are of interest and his list of cases is of importance to students of the question as it exists here, where the matter is far more complicated.

Polyglot fiction is on the increase. It is not so many years since it was thought a remarkable thing that Mrs. Stowe's 'Uncle Tom's Cabin' had been translated into a score of European and one or two Oriental languages. But now every year sees some novel attain several versions. The latest is Ernst Eckstein's 'Prusias,' a story of the last century of the Roman Republic, which will be published simultaneously in German, Dutch, English, Spanish, and Polish, in as many cities. His 'Die Claudier' also appeared in five different languages.

A new field for female industry is suggested by the achievement of Fräulein Camilla Ruzika Ostoić, a Viennese, who has presented to the Royal Academy of Austria a "Türkisch-deutsches Wörterbuch," with a transcription of the Turkish words. With it she sent also a transcription of the Turkish translation of the Gospel of Matthew and of the Turkish play "Ajjar-i-Hamza." Translation, which is already very extensively practised by women, certainly has every mark of a feminine trade: it is muscularly easy and it is ill paid.

As a number of the *Osservatore Cattolico* has been seized by the Italian Government for an article entitled "Il dito di Dio," on the Ischian earthquakes, we may assume that it has been following the good old theological practice of attributing to the misdeeds of the enemies of the Church a natural convulsion by which its opponents and its friends alike have suffered. The calamity at Ischia is a modern fall of the tower in Siloam. Every one knows the lesson which the founder of the Church draws from that fall; but the temptation to overwhelm one's opponents with the easy argument drawn from their misfortunes is too strong to be resisted.

—The *Atlantic* for October contains some interesting "Historic Notes of Life and Letters in Massachusetts," by the late R. W. Emerson. They were apparently written late in life, when expe-

rience, and the gentle humor which mellowed all his observations of life, enabled him to look back on Brook Farm, and Transcendentalism, and even on the orthodox materialism against which Transcendentalism was a protest, with the eye of a philosopher rather than a reformer. His account of Brook Farm will be read with interest by a good many well-known people, whose names no one would now associate with Socialism much more readily than they would with Communism, and yet who, some fifty years ago, burned with the generous flame kindled by Fourier and Owen, and longed to make mankind happy by reconducting it to what we now see would have been a sort of primitive barbarism. Hawthorne's view of Brook Farm Mr. Emerson rather resents, and yet there is very little essential difference between the picture of it presented in these pages and in those of the 'Blithedale Romance.' Hawthorne never looked at the movement with much interest beyond that of curiosity, while Emerson sympathized with it, and felt that the great events that filled the national scene toward the close of his life vindicated the impulses, if not the ideas, to which the Brook Farm experiment had been due. In an article on "Heredity" Mr. H. W. Holland attempts to trace some of the moral and social consequences which he thinks will flow from Mr. Galton's discoveries. He does not altogether distinctly state what he considers the "law" to be which is to revolutionize ethics; but, as we understand him, he sympathizes with the view of Mallock, that if the fundamental basis of development is the survival of the fittest in the struggle for existence, and consequently the extermination of the unfit, the weak, the lame, the halt, the blind, then altruism, which leads the strong to sacrifice themselves to the preservation of the weak, whether we call it Christian or philanthropic, is opposed to the eternal veracities, and consequently bosh. But Mr. Holland seems to overlook the fact that all progress hitherto made in civilization has been by the amelioration of this great law of nature in the interest of justice, mercy, charity, peace, and good-will, all of which are species of altruism. A law of nature may account for the prevalence of might, and show how it is that the weaker type goes to the wall and the stronger replaces it; but a system of ethics founded upon the right of the individual to point to this law as a justification for whatever wrong, violence, rapacity, or inhumanity he might commit, would be a very strange one. We do not say that Mr. Holland proposes to deduce such a consequence from it; but the drift of his argument is in this direction.

—The October *Harper's* contains as one of its leading illustrated articles an account of the "Blue Grass Trotters," by Mr. W. H. Bishop. The development of the trotter and his "record" is one of the extraordinary features of American life during the last thirty years; especially when we remember that the trotting horse comes from precisely the same source that the English thoroughbred does. What is the secret of our devotion to this gait? Mr. Bishop tries to account for it, but only, it seems to us, with partial success. He says that it "may be somewhat connected with the improvement of the roads of the country"; and that driving as a diversion is more easily learned and carried on than riding; and "while a thoroughbred must be almost necessarily devoted to racing, so that if he is not a good one he is good for little or nothing at all, a trotter, though he may not be among those who win laurels on the track, can still be both serviceable and ornamental on the road." In other words, one might expect to find racing highly developed in a country possessed of a large and wealthy leisure class, much given to riding; while trotting, on the other hand, would be a natural sport in a driving country, in which the breeding of running horses would not meet any popular "want." There is hardly a town in the northern part of the United States, with a population of 10,000 people, which has not its local "track"; and according to Mr. Bishop, the amount of capital which the trotting interest represents altogether is $200,000,000, exclusive, if we understand him, of the horses, the aggregate value of which must be very great. The moment we reflect upon what a track in a Northern town is, and especially upon what a Northern town itself is, we perceive how impossible any development of racing would have been. Of late years, with the growth of a rich leisure class, which is able to devote its money to the cultivation of exotic pursuits, the race-horse has come up, and so at the same time has hunting. But the trot is still, notwithstanding the victories of American horses in English races, the American gait.

—Dr. John S. Billings, in a recent pleasant discourse on "Medical Bibliography" before the Medical and Chirurgical Faculty of Maryland, gave "a few specimens of the inquiries made at the Library of the Surgeon-General's Office in Washington." These were—

"'for the literature of hydrophobia'; 'for all cases of epilepsy reported as cured by burns'; 'for a complete list of all books and papers written by Dr. John Jones'; 'for materials for the life of Dr. John Morgan'; 'for a list of the printed medical theses of the graduates of the University of Pennsylvania'; 'for materials for a history of the medical schools of Baltimore, including all catalogues, announcements, etc.'; 'for all accounts of epidemics occurring in Memphis'; 'for data relative to the diseases of Georgia'; 'How many editions have been published of the treatise of the school of Salernum?' 'Which is the best edition of Galen?' 'Who was the author of "Sechs Bücher auserlesene Arzenei," etc., published at Torgau in 1600?' 'Where can I find a paper "On the Voice" by Dr. H. H. Hayden, published in some journal or transactions forty or fifty years ago?' 'Where can I find a paper "On the Differences between Dead and Living Protoplasm," recently published, author's name not remembered?' 'What is a copy of Bagellardus's "De Egritudinibus infantium" worth?' 'What will you give for a perfect manuscript in good condition, written in 1429, being extracts from and commentaries on Almansor and Isaac, and making 160 leaves folio?'"

Dr. Billings did not use the fact of such inquiries, rational and irrational, as an argument for the preservation apart of the Surgeon-General's Library, as he might have done later on in his discourse when speaking to this point. But it is clear that if the collection were once merged in the National Library, the medical profession not only would lose their present interest in keeping it up by voluntary contributions, but would speedily cease to feel that it existed for them in the sense manifested by the above drafts upon the good-nature and patience of the librarian.

—The membership of the Dante Society (of Cambridge, Mass.) has increased but little during the past year. Its second annual report shows fifty adherents, three-fifths of whom are New Englanders by residence, and one-half live in Boston or Cambridge. Further West than Hannibal, Missouri, or further South than Washington, the Dante cult, apparently, does not thrive. The general neglect of the study of Italian in this country readily accounts for such a limited interest, though we must not overlook the consideration that our territorial vastness is a standing obstacle to literary and scholarly co-operation. However, the Dante Society has a "balance on hand," and a Dante library for the use of members (whether by loans at a distance does not appear), which the present owner means to deposit ultimately with the library of Harvard College, and which the Society is keeping up by additions. It has within a twelvemonth purchased a fifteenth-century MS. of the 'Divine Comedy,' with Latin annotations, and placed it beside the copy of the Laurentian MS. of Benvenuto da Imola's Comment on the 'Inferno' made for the Society at Mr. Longfellow's expense. To lend a permanent value to the present report, the Society has reprinted the well-known lives of Dante and Petrarch from the pen of Leonardo Aretino. It is a pity that this writer's simple and lucid style should have been marred here by following an archaic punctuation. The intrusion of the comma is particularly exasperating, as in "divisioni assai tra Guelfi, e Ghibellini"; "appellandoli, scelerati, e cattivi"; "l'ingegno grande, e alto non ha bisogno," etc. Nor is there any good reason for not paragraphing these lives.

—The eminent Danish critic, Georg Brandes, who recently returned to his native country to accept a professorship in the University of Copenhagen, continues to enrich the periodical literature of Germany with his brilliant essays. He contributes to late numbers of the Vienna *Neue Freie Presse* an article on the Russian novelist Dostoyevsky, who, at the time of his death, in January, 1881, was perhaps the most popular writer in Russia, though his name is scarcely known outside of his native country. Dostoyevsky's influence was as far-reaching as Turgeneff's; like him he remorselessly exposed the social diseases of Russia; but Dostoyevsky was essentially a philanthropist: he was "the poet of the helpless pariah." "What Wilberforce did for the negro in the English Parliament Dostoyevsky did in literature for the Russian proletariat." And, in contrast with Turgeneff's hopeless pessimism, Dostoyevsky possessed an almost fanatic belief in the power and future of Russia. Like so many of the best minds of his country, Dostoyevsky early suffered for his patriotism. Soon after the publication, in 1845, of his first novel, 'Poor Folks,' Dostoyevsky, then twenty-four years old, was accused, with twenty other students, of treasonable plottings, and, although their only crime consisted in sharing the prevailing dreams of Saint-Simon, Fourier, and Louis Blanc, he and all his companions were sentenced to death. They were being led to the place of execution when their sentence was commuted to deportation to Siberia. Dostoyevsky remained there until 1858, when he returned, permanently broken in health, but resolved to plead henceforth the cause of the oppressed. He wrote 'The Lowly and Humbled' and 'Notes from the House of the Dead,' but neither of these works achieved the success of his 'Crime and Punishment,' which, in the opinion of Brandes, is surpassed by no contemporary Russian work of fiction. It is the story of a young Russian student, ambitious, melancholy, and burning with desire to right the wrongs of society, yet bowed down by his own poverty and the distress of his old mother and noble sister. Slowly he matures the plan of murdering and robbing an old hag, a pawnbroker and vampire, whom he persuades himself it is a duty to society to kill. He coolly commits the deed, and never regrets it, although he was also compelled to kill the victim's innocent sister; but, unable to practise life-long deception, he surrenders himself finally to justice. The reasoning by which he justifies his crime throws a vivid light on the working of the Nihilistic mind of to-day; and the entire work, which throughout shows the hand of an "unrivalled master of pathological psychology," is "of the greatest importance as explaining the origin of modern Russia."

—Mr. Shapira, the Christian Hebrew of Jerusalem, has been cruelly dealt with in England. In Berlin, whither he first carried his Deuteronomy in Moabitish characters, the committee convened by Professor Lepsius to examine into the merits of its stained leather and archaic writing told the famous dealer in Moabitish pottery and sacred antiquities, after a few hours' waiting, that the manuscript which he offered for sale was a forgery—Professors Dillmann, Sachau, Schrader, and other famous Semitic scholars being responsible for the verdict. The British Museum kept him waiting for weeks, while Dr. Ginsburg, charged with the task of deciphering the strange text, transliterating it into square Hebrew characters, and translating it into English, was performing his labor with conscientious slowness. Meanwhile, before the decision was rendered, M. Clermont-Ganneau, of Moabite Stone fame, sent expressly by the French Ministry of Public Instruction to London to find out the value of the documents, did not hesitate to declare in the *Times*, after the brief and partial inspection allowed him, that the Deuteronomy in King Mesha's style of writing, alleged to be, like that monarch's monument, almost 3,000 years old, was written on the cut-off broad bottom margins of a modern synagogue roll. On what was this terrible declaration founded? On this: Mr. Clermont-Ganneau had discovered perpendicular creases, and fine lines drawn with a hard point on each side of them, crossing the horizontal lines of the Moabitish writing, without any relation to it, and corresponding respectively with the creases in the modern leather rolls of the Pentateuch, and with the projecting ends of the guiding lines drawn by writers of such rolls to keep the margins of the columns true. Next came Dr. Neubauer, pointing out false spellings, misapprehensions of the context, and misapplied Hebrew words—not many, for even the severest opponents of Mr. Shapira speak of the cleverness of "the forger," but just enough to make the anxious expectant of riches and immortality tremble. Worse followed. Unmistakable proofs were discovered that some of the blunders were owing to a confounding of Hebrew sounds; which could be explained only by the fact of the writer having learned his Hebrew in the pronunciation now common in Poland and Germany, and widely different from that of the ancient dwellers on the Jordan. The agony is now over. Dr. Ginsburg has reported, agreeing with Clermont-Ganneau, Neubauer, and the critics of Germany, and not a voice is raised in defence of the authenticity of the find. Both orthodox and rationalistic Biblical scholars are gainers by this definitive exposure of the forgery. The many deviations from the canonical text presented by the forged document will not discredit the authenticity of the Hebrew Scriptures as we have them, and the archaic Moabitish style of writing will not invalidate the view universally taken by liberal criticism, that the so-called Fifth Book of Moses was composed as late as the time of Jeremiah.

—M. Weber, the musical critic of the Paris *Temps*, discusses in a recent feuilleton the influence of music on animals and insane human beings. He agrees that serpents are charmed by music, that elephants receive pleasure from it, and dogs annoyance. He also believes that spiders like music, although the better opinion is that what attracts them is simply the vibration communicated to their web, which is mistaken for a fly's buzzing. Birds, he says, may be taught the sweetest melodies of Mozart, yet in their courtship make no use of their acquisition. This, however, is a side issue. The real question is: do the male birds make use of their natural song in order to charm the females? Darwin thinks they do, and bases on this his theory of sexual selection, which seems to be confirmed by the fact that it is only during the season of courtship that the birds sing. But it is quite possible that these songs have been developed simply as a means of discrimination of species, to enable the females to find their mates. We are inclined to take this view, and to doubt the existence of any specialized æsthetic emotion not dependent on association of ideas. As regards the influence of music on man in health and disease the most ridiculous theories have been advanced. A small library could be made of the books and articles in which music is regarded as a remedy for various diseases and infirmities. M. Weber is disposed to assign the "grand prix d'absurdité" to Porta, a physicist of the sixteenth century, who believed that various diseases might be cured if musical instruments were made of the wood of special medicinal plants which would communicate their healing qualities to the music produced by these instruments. The Parisian habit of attending the opera immediately after dinner might seem to argue the possession by music of digestive virtues. This may be the case with the light and frivolous music preferred by the Parisians, which has just enough merit to arrest the attention and prevent the mind from brooding over serious thoughts liable to interfere with digestion. The polyphonic music of Germany requires a greater effort and stimulates the brain in every fibre; hence, perhaps, the German habit of deferring supper till the opera is over. It is on the nervous system of man that music exercises an undoubted influence. Soldiers bear the fatigues of a march much more easily while listening to the strains of a brass band; and to any one suffering intense grief music acts as a marvellous tonic. Frequent experiments have been made to determine the curative value of music in lunatic asylums, and it seems to be agreed that although it may not effect an absolute cure, it is yet of the greatest value in many cases as a hygienic agent. It engrosses the attention and distracts it from the phantoms and fixed ideas which harass the patients in certain stages of their disease. M. Weber once, in a lunatic asylum, formed one of a quartette, the bassoon part of which was played by a patient whose malady did not prevent his remaining a good instrumentalist. It is said that in a hospital near Naples all the inmates are musical: every new-comer chooses his instrument and joins the band. In another hospital near Milan a visitor heard an orchestra of five flutes, six cornets, and five trombones—a combination that would have suited Berlioz in one of his most fantastic moods.

—In England and America the operetta is more successfully cultivated than the opera, and the two most gifted and popular composers in this *genre* at the present time are Strauss and Sullivan. Their biographies will be found close together in the new issue of Grove's 'Dictionary of Music and Musicians,' Parts 17, 18 (Macmillan & Co.), which cover no less than 240 pages, but only extend from Sketches to "Sumer Is Icumen In." Dr. Grove has not, it seems, been uniformly successful in keeping loquacious contributors within reasonable limits. The worst example of this excess was the long, ponderous, and perfectly gratuitous article on Schools of Composition in the last issue. The present contains a fifty-page article on Song, which might also have been condensed to half its dimensions. It was quite proper to consider such nations as Russia, Spain, Scandinavia, and Hungary besides the three great musical nations, Germany, France, and Italy; but too much space is devoted to the early periods. Nor can it be said that the characterization of the best modern masters is very incisive or pregnant. Another long article is by Dr. Parry, on Sonata, which, however, cannot be called too long, as it not only gives a clear and detailed history of this venerable and important form, but includes a dozen columns of admirable criticism of the different styles of the great masters who have made use of it, from Bach and Haydn to Chopin and Liszt. It is pointed out that the sonata now occupies a smaller and decreasing space in the domain of music, and that the solo sonata form is less esteemed by modern composers than the duo form. The neglect of the sonata by these composers is of course not due to a want of technical ability—which any hack-musician may acquire—but to the fact that their ideas are too poetic, concentrated, and intense to be forced into the prescribed artificial forms of a former generation. The allied but less organic form of the Suite is also considered at sufficient length. Of the biographic articles the most important are those on Spontini, by Spitta, the learned biographer of Bach, and on Spohr, by Paul David. The latter notes the curious fact "that Spohr, who, in the case of Beethoven and Weber, exhibited such inability to appreciate novelty—and who at bottom was a conservative of conservatives in music—should have been the very first musician of eminence to interest himself in Wagner's talent" by producing the "Flying Dutchman" in Cassel. The only apparent bond of sympathy between these two composers is their common fondness for unusual modulations and keys; but Spohr could not help admiring the dramatic vigor of Wagner's opera. The article on Stradella adduces strong evidence to prove that the well-known story of the assassins who were hired to kill him, but were so overcome by the charm of his music that they spared him, is a myth like many of its kind.

—Woodcuts are not very numerous in Grove's 'Dictionary,' but a few are added to the articles on Stradivari, Spinet, and Soundholes, the evolution of which and gradual adaptation to acoustic principles furnish an interesting illustration of the doctrines of Darwin. The writer on that insignificant but important little peg, the Sounding-Post, makes clear the reason why the French call it the "soul" and the Germans the "voice," for on its proper adjustment depend both the voice and the soul of the instrument. Under Sordini some curious information is given regarding the various devices made use of by composers—especially the two greatest instrumental writers, Wagner and Berlioz—to produce weird and unusual effects, as for instance by putting a rolled up handkerchief or a pear-shaped piece of wood into the bell of a brass instrument, by making singers hold their music before their mouths, singing with their backs to the audience or retiring to a room behind the orchestra, etc. The writer makes the important observation that the mutes used for 'cello and double-bass are rarely heavy enough. The double-bass mute used by him weighs more than a pound. At Bayreuth the tone of the whole invisible orchestra is veiled and ethereal-ized by its covered position. Finally we must mention the conclusion of Mr. Rockstro's interesting article (Sketches) on the different ways in which composers work. Three diverse modes of workmanship are well typified by Beethoven, Mozart, and Schubert. Mozart prepared a full mental copy of his work before he sat down to put it on paper. Beethoven began with a primordial germ, a sketch which he committed to paper and gradually enlarged and modified, occasionally a dozen times before he was satisfied. Schuber differed from both. He com-

mitted his ideas to paper under the influence of uncontrollable inspiration, as other people write a letter; and seldom did he make an erasure or correction. This is perhaps he highest form of genius, as we read of something similar in Goethe's case. But the result often shows a lack of concentration and too much "linked sweetness long drawn out."

LODGE'S WEBSTER.

Daniel Webster. By Henry Cabot Lodge. [American Statesmen.] Boston: Houghton, Mifflin & Co. 1883.

THIS latest product of Mr. Lodge's historical studies is doubtless to be regarded as one of the most important contributions to the valuable series of which it forms a part. The subject, though well worn, continues to be one of absorbing interest. It is evident that public opinion for some years past has been steadily crystallizing into definite form concerning Webster; and yet his genius was so great, and his part in affairs so conspicuous, that any word fitly spoken in regard to him is sure to receive a hearty welcome. It is not the claim of Mr. Lodge that any considerable amount of new evidence bearing on Webster's life is brought to the public in this volume. The purpose of the book is, on the one hand, simply to present an outline of Webster's career, and, on the other, to show the significance of that career in the constitutional development of the country.

In so far as it may be possible to separate from each other the two parts of this double purpose, it may be said that the first has been performed with eminent success. The great features of Webster's life are so well drawn as to leave little to be desired. The perspective is excellent. While the connecting narrative is not neglected, the author has very properly thrown into conspicuous relief the great events with which he has to deal. The reader has no difficulty in seeing that the real historical significance of Webster's career is to be sought in the argument on "The Dartmouth College Case," in the "Reply to Hayne," and in the "Seventh of March Speech." Mr. Lodge also presents very clearly the striking continuity of Webster's political theories. Attention is called to the fact that in his effusive oration on the green at Hanover, when he was a college student of eighteen, Webster sounded the key-note of all his subsequent career. "The grandeur of American nationality; fidelity to the Constitution as the bulwark of nationality; and the necessity and the nobility of the union of the States"—such were the leading thoughts of his discussion. Mr. Lodge goes so far as to say: "The enduring work which Mr. Webster did in the world, and his meaning and influence in American history, are all summed up in the principles enunciated in that boyish speech at Hanover." In this statement the author has probably indulged in no exaggeration.

In what is to be called the second part of his general purpose, Mr. Lodge has not, in our opinion, by any means been so successful. We may as well give out our whole thought at once, and say that he seems to us signally to have failed to grasp the true meaning of Webster's work. We cannot help thinking that his judgment has been warped, and his vision blinded, by his strong bias in the direction of State rights. In his presentation of the "Dartmouth College Case" he has, indeed, stated the facts and indicated the principles involved with commendable clearness; but when he comes to an analysis of Webster's argument, he virtually accuses the advocate of appealing to what were practically personal considerations, and, in attributing to those considerations the weight he does, he virtually, also, accuses Marshall of founding the decision of the Court on other than strictly constitutional grounds. Though Mr. Lodge does not say as much in express terms, he leaves the reader to infer that he regards the decision of the Court as constitutionally unsound. This may be a matter of opinion, in regard to which Mr. Lodge is fairly entitled to be exempt from historical criticism; but in this connection it is of historical importance as indicating an attitude of mind which, a little later in the volume, leads him into palpable error.

The leading thought of the discussion, indeed of the whole volume, is that Webster practically created a new doctrine of nationality. This thought crops out in the discussion of the "Dartmouth College Case," but it does not appear in full relief until the author comes to his analysis of the "Reply to Hayne." Here he takes the bold ground that up to the time of that discussion the doctrine of State sovereignty and the constitutional right of nullification and secession had generally been accepted. The peculiar merit of Webster's work, therefore, was to sweep those old historical doctrines away and to establish a new doctrine in their place. That we may do Mr. Lodge no injustice, we give his words. Of the "Reply to Hayne" he says:

"The weak places in his armor were historical in their nature. It was probably necessary, at all events, Mr. Webster felt it to be so, to urge that the Constitution at the outset was not a compact between the States, but a national instrument, and to distinguish the cases of Virginia and Kentucky in 1799 and of New England in 1814 from that of South Carolina in 1830. The former point he touched upon lightly, the latter he discussed eloquently, ingeniously, and at length. Unfortunately, the facts were against him in both instances. When the Constitution was adopted by the votes of States at Philadelphia, and accepted by the votes of States in popular conventions, it is safe to say that there was not a man in the country, from Washington and Hamilton on the one side to George Clinton and George Mason on the other, who regarded the new system as anything but an experiment entered upon by the States, and from which each and every State had the right peaceably to withdraw, a right which was very likely to be exercised" (pp. 176–77).

How Mr. Lodge can have fallen into such depths of forgetfulness as to write this passage it is difficult to conceive; but he goes on from bad to worse, and fairly takes one's breath away as he pens the following:

"When the Virginia and Kentucky resolutions appeared, they were not opposed on constitutional grounds, but on those of expediency and of hostility to the revolution which they were supposed to embody. . . . No one troubled himself about the constitutional aspect: it was a question of expediency, of moral and political right and wrong" (p. 177).

It must be admitted that if the sweeping statements of these two passages are historically correct, two conclusions will inevitably follow. In the first place, Mr. Webster will have to be regarded as the founder of a new theory of our national existence, and, secondly, the arguments on the general subject of secession, so far as they are to be drawn from the first forty years of our national history, are exclusively in favor of the South. But Mr. Lodge's declaration is not correct either in the letter or in the spirit. The simple fact is, that the stupendous importance of the "Reply to Hayne" was not in the novelty of its doctrines, but in the consummate art and the irresistible logical skill with which it embodied into compact and popular form the doctrines which from the first had been held by the most authoritative interpreters of the Constitution. Its merits were analogous to those of the Great Charter in English history. It contained little in the way of constitutional doctrine that could be called new, but it performed the priceless service of expounding the true doctrines to the nation and of carrying those doctrines with convincing power into the hearts of the people. Indeed, to one accustomed to observe the laws governing the evolution of public opinion, it must seem preposterous to suppose that Webster's "Reply" could have had any approach to the power and popularity it enjoyed if it had been made up simply of political and constitutional novelties. It is not new doctrines that have power to move a nation, unless it be in the way of resistance.

But what are the facts of our early history, so far as they have a bearing upon Mr. Lodge's position? A few words will be enough to show the nature of his error. Of all the framers of the Constitution, no one was better qualified by ability, by learning, and by position to speak authoritatively of the meaning of that instrument than Judge Wilson, of Pennsylvania. He had been a member of one of the most important committees in the Convention at Philadelphia; his opinions were so highly respected by Washington that he was appointed one of the earliest justices of the Supreme Court; and when the State of Pennsylvania held its convention to consider the Constitution, it was regarded as especially fortunate that Wilson was present to give the necessary exposition. The report of his speeches covers more than a hundred pages of Elliott's 'Debates.' In the course of his remarks he touched upon almost every important subject, not omitting that of "compact." He declared distinctly that a "contract" or "compact" could only be formed between two or more parties, that in the Convention there had been but one party, and that that party consisted simply of representatives of the people. The whole tenor of his argument went to show that the new government was, to use his words, "founded on the power of the people." He said of the introductory clause: "'We, the people, do ordain and establish,' etc., is not an unmeaning flourish. The expressions declare in a practical manner the principle of this Constitution. It is ordained and established by the people themselves; and we who give our votes for it are merely the proxies of our constituents." This was regarded as an authoritative exposition; for a copy of it was sent by Washington, with his approval, to the Convention in Virginia, and Marshall made use of it in his famous decision of McCulloch *v.* Maryland. In its argument it is especially suggestive of Webster, while its phrase, "made *for* the people as well as by them," reminds one of the most famous passage in Lincoln's Gettysburg speech.

A similar spirit was predominant in the convention in New York. At the moment when the opposition was most stubborn, and when it was well known that failure of the Constitution in New York meant general disaster to the Federal cause, Mr. Lansing offered his famous resolution to adopt the Constitution provisionally, "reserving to the State of New York the right to withdraw herself from the Union." Hamilton, apparently in despair of getting further concession, asked the opinion of Madison as to the practicability of such a ratification. The reply was that the Constitution "required an adoption *in toto* and for ever." As is well known, this also was the opinion of Hamilton.

Mr. Lodge's assertion, that the Virginia and Kentucky resolutions "were not opposed on constitutional grounds," appears in its true light when we look at the "answers" to those resolutions offered by the Legislatures of the several States. Such an inspection will show that they were condemned for constitutional reasons no less than for reasons of policy. The Legislature of Rhode Island passed a resolution that "for any State Legislature to assume that authority [the authority contemplated by the Virginia resolutions] would be an infraction of the Con-

stitution of the United States expressed in plain terms." Massachusetts said: "Should the respectable State of Virginia persist in the assumption of the right to declare the acts of the national Government unconstitutional; and should she oppose successfully her force and will to those of the nation, the Constitution would be reduced to a mere cipher." New York said that the resolutions contained "sentiments and doctrines no less repugnant to the Constitution of the United States and the principles of their union than destructive to the Federal Government." Vermont declared the doctrines of the resolutions "unconstitutional in their nature and dangerous in their tendency."

We have neither time nor space to carry this subject further. We had intended to make some observations on the author's judgment of the Seventh of March Speech, but we must forbear. We can only say that he shows clearly enough that Webster, from his previous declarations, had given his friends reason to hope for a positive and powerful utterance in behalf of the anti-slavery cause. But no one can judge Webster aright without keeping firmly in remembrance the fact that there had never been a time when his love of the Union was not far stronger than his hatred of slavery. We are not sure that Mr. Lodge holds that fact at its true value.

RECENT NOVELS.

The Invisible Lodge. From the German of Jean Paul Frederic Richter, by Charles T. Brooks. [Leisure-Hour Series.] Henry Holt & Co.

The Miseries of Fo Hi, a Celestial Functionary. Translated from the French of Francisque Sarcey, by H. R. H. Chicago: Jansen, McClurg & Co.

Times of Battle and Rest. By Z. Topelius. Chicago: Jansen, McClurg & Co.

A Washington Winter. By Madeleine Vinton Dahlgren. Boston: James R. Osgood & Co.

A Newport Aquarelle. Boston: Roberts Bros.

THERE is very little that is original or new in 'Altiora Peto,' which is rather an extravaganza than a novel, in the proper sense of the word. The name of the English heroine is a pun; the two American heroines change names for the sake of deceiving the English heiress-hunters; the plot, or part of it, is aptly described by one of these young ladies as being like "The House that Jack Built"—*e. g.*, "This is the man that Stella hates. This is Stella, who makes love to the man that she hates. This is the man in love with Stella, who makes love to the man that she hates. This is the woman in love with the man in love with Stella, who makes love to the man that she hates. This is the girl who despises the woman in love with the man in love with Stella, who makes love to the man that she hates. This is the man in love with the girl who despises the woman in love with the man in love with Stella, who makes love to the man that she hates. This is the fool who is jealous of the man in love with the girl who despises the woman in love with the man in love with Stella, who makes love to the man that she hates." The tangled skein of the story is very skilfully unwound by Mr. Oliphant; and if the characters were more interesting, the book would be decidedly entertaining. But the characters are almost all a little worse for wear. Altiora is the freshest. She is the conscientious, thinking, reading girl of the day, who is puzzled by learning too early that the world is full of questions which nobody has been able to answer, and which stagger even her acute young mind, and numb her sensitive heart. She falls in love with a priggish young æsthete, a tolerably familiar type, but gets speedily cured by a second prig, who is not an æsthete. Then there are the two American girls, Stella Walton and Mattie Terrill, one of whom is a great heiress, and both of whom represent our glorious country by great freedom of manner and language, combined with that purity of heart which, in Mr. Oliphant's view of the world, the absence of conventionality tends to produce. They have with them a terrible old companion, or chaperon, named Hannah, who talks like something between a Maine Yankee and Buffalo Bill. Her conversation, masculine as it is, does not interfere with her having an excellent heart; and we suppose there is nothing in American etiquette, as at present established, to prevent the two girls going about Europe with old Hannah, calling men by their first names whom they have only just met, and so on. Nor is there anything intrinsically impossible in these impossible people getting into English society, at least when we understand that it is the society in which Lord Sark and his *chère amie*, Mrs. Clymer, the professional beauty, move; their *liaison* being a matter of general notoriety as well as an ordinary subject of conversation. Americans who feel sore over the way English writers misrepresent American girls, may derive a good deal of consolation from the way in which Mr. Oliphant treats English society. As depicted by him, it is a combination of Bohemia and Botany Bay. It is, of course, closely connected with the world of finance, Altiora herself being the victim of a stupendous fraud perpetrated by her financial guardians. We say the book is an extravaganza, partly because of the burlesque character of the situations; but the author calls it a novel, and perhaps it is as an international novel that it will have to be judged.

Mr. Hardy's milkmaid is a young person who has adventures not unlike those of a fairy story; but the termination of them is not very romantic. The mysterious nobleman whom she saves from suicide, and who afterward involves her in very unnecessary difficulties through his kindness, ought by rights to carry her off in the end; and the reader's sympathies are outraged by having him disappear into space, leaving the milkmaid to subject herself to the yoke of a prosaic and perfectly suitable marriage. We thought better things of the author of 'A Pair of Blue Eyes' and 'Two on a Tower.' It is almost uncivil to give *blasé* grown-up readers a glimpse of fairy-land, with all its characters and properties—the Prince, the poor but pretty maiden, the nocturnal rendezvous, the metamorphosis from Cinderella into the brilliant *débutante*—and then to put us off in the end with a humdrum daylight termination.

The 'Sea Queen' is, in certain features, the 'Wreck of the *Grosvenor*' over again. It is a tale of mutiny, disaster, wreck, and final rescue, in all of which a woman takes a leading and heroic part. A good deal of it is decidedly interesting, and the suspense in which the reader is kept over the mutiny is very well managed; and the vacillation of the men, the courage and anxiety of the captain, all have an air of reality which makes us suspect that Mr. Russell is drawing less upon his imagination than his memory. The later adventures of the captain and his wife, the discovery of the fever-stricken ship, and the reappearance of the mutineers, and their sudden conversion, have a little too much of the melodrama in them to be thoroughly good.

Mr. William Black, to judge by one or two of his last novels, has reached a very dangerous point in his career. He has begun to write stupid novels, and to foist them upon the public on the strength of the reputation acquired through his bright ones. 'Yolande' is insufferably dull—duller even than 'Sbandon Bells.' We frankly confess that we have not read every word of it by any means, but it is in the interest of Mr. Black that the reader should "skip" in reading it, or perhaps, to be more accurate, that he should not read it at all. Yolande herself is not a badly-drawn character, and the motive of all the complications of the story is well conceived. Much might have been done with an opium-eating mother of whose existence her daughter had been kept in ignorance; from her appearance in the early part of the story and her indefensible stone-throwing at her husband's windows, we were led to expect adventures of an exciting nature. But nothing follows; there are, for seventy pages, no consequences of importance. A gentle dulness pervades the tale throughout this vast expanse, unenlivened by anything but a tame love-affair. In other words, most of the story is occupied in reaching the crisis. It is this to which we strongly object. Authors who should write stories in Mr. Black's present manner, even if they gave a hint in the preface or through a table of contents as to where the story really began, would not succeed. Had he done this with 'Yolande,' however, the world would probably have spared itself a great deal of searching without any adequate results in the way of discovery. Mr. Black seems to have been run away with of late years by his passion for description and detail, and perhaps he may reply to the suggestion that what we want is a story, in the well-known words of the needy knife-grinder. But Mr. Black once had stories to tell. The market for his fiction, we are strongly inclined to suspect, will soon begin to suffer from "over-production."

Mr. Murray's last novel will hardly add to his fame. It shows close observation, a good deal of humor, and a certain knowledge of the world—all excellent qualities. Its principal defect is the very common one, that the characters are rather puppets of the author's than human beings with minds, hearts, and wills of their own. So rarely, however, does a novel-writer appear who is not open to this criticism, that Mr. Murray is hardly to be found fault with for the defect. The construction of the story is not very clear; much more might have been made out of the materials of the plot. There is promise in the beginning of a better novel. The history of young Tregarthen's army difficulty is very good.

Mr. Bret Harte's latest story recalls many of his earlier sketches of Western life. It is, to our minds, quite as good as some of the best of these; and if it has not been received by the public with the same enthusiasm, it is probably because the public taste has changed, and the market for such fiction is no longer what it was. Mr. Harte is undeniably a Californian product of the same tone of feeling which gave Dickens his opportunity in England. It is impossible to read any of his stories without being continually reminded of the English novelist. Mr. Harte has done for the Western desperado of either sex much what Dickens did for the bad characters of London. That is, he has idealized them,

made us like them, think well of them, and feel our common humanity in them. This both writers do by the same means—by making their fate turn upon the redeeming feature of their character: courage, truthfulness, womanly devotion, as the case may be. The fundamental objection to this, as a matter of literary art, is that, if it is done habitually, we cannot help reflecting that in real life the fate of such characters is determined, as a general rule, by their vicious or criminal rather than their virtuous tendencies, simply because these preponderate so heavily. The crisis in a burglar's life is more apt to be a commonplace sentence to the penitentiary than some act of heroism; and a career devoted to burglary or other crime tends in the long run to extinguish unselfish impulses. Dickens really reversed this law, and made us feel as if it was very doubtful whether a disreputable life was not most calculated to lead to true goodness. In the same way, Mr. Harte's characters are developed. The heroine of the 'Carquinez Woods' is a variety actress, of the lowest stamp, who, under the influence of love, displays all the qualities that most endear woman to us. We do not say that this is impossible, for even in a variety actress a deep affection may produce wonderful results; but the thing has been done too often. As a literary device it is understood and seen through, and will no longer serve for any writer's capital. If Mr. Harte will persist in relying upon it, he will find it in the end a poor support. We do not mean to say that the 'Carquinez Woods' is an uninteresting story. Far from it. It is in its way a powerful story, and its tragical finale shows true literary feeling; but we can but feel that the author is wasting his forces in the service of an outworn literary fashion, which was sadly overdone even by its great inventor.

Mr. James Payn's last story demonstrates, of course, that it is blood which is thicker than water, but the demonstration itself is not particularly interesting. The plot is very poorly constructed, and, unfortunately, the interest is concentrated at the beginning of the story instead of the end—a plan which no good novelist has ever adopted or recommended to others. Considered as a novel, 'Thicker than Water' is almost ridiculous. Its value consists in isolated chapters and sketches, and in the running comment of the author, which is always bright, and sometimes witty. Even his dialogue is sometimes very good. Society was agog, not so very long ago, over the marriage of an old and rich lady with a man young enough to be her son. 'Thicker than Water' seems to have been in part suggested by this affair, inasmuch as it opens with a proposal of marriage to such a young man by such an old lady. Those who are curious in matters of this kind, and have a strong stomach, may find a good deal of amusement in Mrs. Beckett's courtship of and final discomfiture by the skittish and faithless Dornay.

Henry Holt & Co. have now added to their edition of Mr. Brooks's admirable translations of Jean Paul's romances 'The Invisible Lodge,' which was the earliest in point of time, and which, in fact, decided for himself, if not for the world, the future of his reputation. It was written in his dark time, in that one room which he shared with his mother; he writing by the window in the corner, and she brewing, baking, scouring, or spinning. The hero is a fanciful conception of Jean Paul himself, a poetic rendering of his own spiritual life. Crowded with thought and sparkling with epigram, this romance, now ninety years old, seems out of place among modern novels. Not that it is old-fashioned—it is not of the sort that has fashions; but it is so rich and full. "In the moral desert with its sandy wastes, it is like a cluster of date-trees, with its greensward and well of water." There is no need to commend it to the real student of imaginative literature, and any reader who seeks more than mere amusement will find his account in the treasures of phantasy, of pathos, of humor it contains. A chance cut between the leaves gives us such philosophy as this:

"I would give ten metaphysical optimists for one moral one, who knows how to enjoy, not a single plant as the caterpillar does, but, like man, a whole flora of pleasures; who has not five senses only, but a thousand for everything. . . . There is a certain higher tolerance which is not the fruit of the Peace of Westphalia, nor of the Concord of 1705, but of a life filtered through many years and improvements. . . . Not merely with the best must we be pleased, but with the good and everything."

Or again:

"If a *maître de plaisirs* should draw up for a Prince a plan of decoration for an opera-house, to consist of a rising sun, a thousand Leipsic larks, twenty ringing bells, whole meadows and floras of silken flowers, the Prince would say it cost too much. But the master of pleasures should reply: It costs a walk—or a crown, say I, because such an entertainment requires not the Prince, but the man."

One conceit we must find room for. The translator adds to it this note: "An odd forerunner of our modern local quiz, that good Bostonians hope, when they die, to go to Paris (short for Paradise)." Observe that the date is 1792:

"It is singular that one should make higher stars, or indeed planets, and their daughterlands to be the flower-pots into which Death is to plant us, somewhat as the American hopes after death to go to Europe."

M. Sarcey gravely produces his story as straight from China, a manuscript found by a brave French officer in the sack of an imperial palace. That no two, learned in Chinese, could make it read alike matters little. It was only necessary to choose the most diverting version. But no one at all familiar with the actual life of France could miss the double point of the clever satire, and thoughtful Frenchmen themselves recognize the ills it deprecates. The desire of the *petite bourgeoisie* to better the condition of their sons by placing them in the official class, the *bureaucratie*, is so intense that it blinds them not only to the fact that not one in a thousand reaches the top, but to the deterioration of mind and character which too often follows inadequate employment in purely mechanical work. On the other hand, M. Sarcey exposes the evils that exist in official life in a "much-administered" country like France, where the multiplication of detail and the worship of routine become almost a passion—evils for which the exacting rigor of red-tape is as much responsible as the carelessness of indifferent officials.

Fo Hi, the grocer, is happy when he has seen his son through college and appointed "Supernumerary-Expectant Master-Surveyor of Stone Heaps," while he mourns that he must marry his daughters, one to his chief clerk, the other to a farmer. In the end, the life of Fo Hi, jr., about to be sacrificed to some imaginary affront to his chief, is saved by the intercession of the farmer, now high in the confidence of the Emperor, and soon to become the Minister of Agriculture. The tale of the woes of Fo Hi is long and sorrowful. Thus discourses Li-jou-lin, an old philosopher, upon the effect of the fine enthusiasm with which Fo Hi discharges his first duties:

"His superiors don't like his performances any better than his comrades. He is a young upstart, breaking the peace of the City of God. Is there anything finer or more marvellously ordered than a Government in which each one gives up a part of his work to his neighbor in a spirit of broad public charity? The Surveyor does not survey accurately out of regard for the feelings of the Controller, who in his turn is a little lax in his duties out of respect for the Auditor, who again permits himself a little carelessness in his work out of politeness to the Inspector, who takes good care not to supervise anything lest he should take the wind out of the Director-in-Chief's sails. And this dignitary, for his part, is both blind and deaf to everything out of thoughtfulness for the Minister."

Later, when Fo Hi, growing dull in the monotony of petty routine, insists, "I have a profession which does not leave me a single spare moment," Li-jou-lin replies:

"You are busy, but you do not work. To work is not merely to fill a few hours of life with some kind of occupation. . . . That only is work, in the true sense of the term, which has an end in view, and that end the highest which could be presented to human activity—the great end of making free both him who works and those who are born to him. To emancipate one's self and one's posterity from the miseries of servitude, that is the true and only work."

Too late Fo Hi himself wakens to the need of some personal and genuine interest. "It is absolutely necessary to have a passion and an object in life. . . . But the mischief of it is, that you can't take a passion as you can take a cold." But he could think of nothing which was to his taste, and at last said to himself: "Ah! the best thing undoubtedly would be a passion for one's profession." Yet so ingrain becomes the infatuation that, after all his failures and sorrows, his best wish for the little son of his prosperous sister is, "We will make an official of this little fellow," and thereupon produces for his guidance the Decalogue which his experience has taught him. The reader will find the story worth his study, and will gain from it new light as to the public functionary in China or in France—or in some other countries.

'Times of Battle and Rest' forms the "second cycle" of the "Surgeon's Stories." To call the book dry or dull would be unjust, but the Sweden of the seventeenth century is so remote, not only from ourselves, but from historical events that are of vivid interest to us, that the reader will need some personal motive to make it seem worth while. We have a doubt how far fiction can help in the genuine study of history, but nevertheless the book may be found of value as a description of the state of society in the north just before the days of the brilliant though disastrous career of Charles XII.

'A Washington Winter' and 'A Newport Aquarelle' are professedly society novels. They are really excellent examples of the work of the reporter in fiction. Page after page reads, even in its tameness, like the newspaper column in which Jenkins or his successor sets forth the doings of fashionable life. The stories might be left to the obscurity which is sure to overtake them, had there not been books no better in spirit than these, though a little less coarse and clumsy in execution, which have been taken in all seriousness. For this reason an emphatic word of protest is a duty. It is not to the purpose to say that Mrs. Dahlgren's figures are not like Americans: there are no such human beings under the sun. The story is a climax of supreme silliness. Within polite circles, anything more coarse without positive immorality could hardly be written.

'A Newport Aquarelle' has a veneer of refinement, like the reporter who wishes to commend himself to the givers of balls and dinners. Characters and incidents could no doubt be paralleled in the curiously mixed crowd which makes up Newport, but a picture, to be true, must give the best as well as the worst. The subject is no less hackneyed a one than the career of an English adventurer. He may be left to his deserved fate; nor need we trouble ourselves with the Bostonians, who are

described with an intimacy of knowledge and a pleasantness of spite which suggest that the writer may be to that manner born; but of the heroine something ought to be said.

Gladys Carleton at twenty puts an end to a three years' "understanding" with her cousin, during which time she has been growing "colder and harder and more thoroughly a woman of the world." With perfect beauty but slender fortune, she is taken abroad by her mother, where she is engaged first to a young English earl, then to a German millionaire. From the latter she runs away without a word of explanation. Returning to America, she has, at the date of the story, had twenty-five offers of marriage without counting the accepted one of the rascally Englishman. The reader is to receive her as the typical New York belle, and she is described by the men who see her in terms which are best forgotten. To have fallen a prey to the Englishman who mistakes her for her rich cousin, would have been, in the nature of things, a suitable catastrophe, but she is rescued by the still faithful cousin, who marries her out of hand. Through all this demoralizing career the author describes her as keeping a sweet, tender soul under the mask of worldliness, and making glad at last a man of the noblest character with a pure, unsullied love. This is as false as it is impossible; and such ignorance of the effect of life upon character, such want of moral logic, makes the evil of the book quite as much as its flattering presentation of the most degrading elements in society. As to literary merit, we have already said that the reporter furnishes both the pattern and the standard.

LENORMANT'S BEGINNINGS OF HISTORY.

The Beginnings of History, according to the Bible and the Traditions of Oriental Peoples. From the Creation of Man to the Deluge. By François Lenormant, Professor of Archæology at the National Library of France, etc., etc. Translated from the second French edition. With an Introduction by Francis Brown, Associate Professor in Biblical Theology, Union Theological Seminary. Charles Scribner's Sons.

THIS title is not short, indeed; but it ought, we think, to be longer by a line or two stating the name of the translator, Miss Mary Lockwood, of Washington, D. C., who, as the introduction tells us and as we find ourselves, "has discharged the laborious work of translation with fidelity and skill." The extraordinary care with which the transliteration of the multitudinous Semitic words—so as "to represent the sounds correctly to the English, as the author aimed to represent them to the French, ear"—the verification of the countless references, and occasional rectification, have been carried out (probably with the aid of Professor Brown), is quite refreshing amid the shocking exhibitions of editorial or translatorial levity and ignorance which we daily meet with in English reproductions. The introduction is brief and to the point, and its general estimate of M. Lenormant is, in our view, correct. "His versatility, energy, rapidity in work," are justly praised, while it is admitted that even "his warmest admirers will not claim . . . that he is always judicious. It is natural that so ardent and original [a] scholar should sometimes be incautious and hasty in his conclusions, and that so facile a worker should not always observe the greatest care in minute particulars." This agrees quite well with what we said ourselves some years ago in the columns of this journal (No. 678)—an opinion unaltered by impressions derived from the more recent products of M. Lenormant's untiring pen:

"He is a very diligent but easy-going critic. He is inclined to accept as true what great authorities announce with sufficient positiveness as a new discovery. He examines the latest results with serious but good natured inquisitiveness, applies the test of a criticism entirely free from captiousness, modifies his own former conclusions with the readiness of a disciple, and communicates the latest acquisitions with an obvious fondness for both learning and book making. . . . He enters perhaps too easily upon insecure paths through the mazes of antiquity, but he follows sound guides; and if at the end of his search he finds not truth, but conjectures, the results are still interesting."

In the work before us M. Lenormant moves on paths more insecure than any he has ever trodden, through mazes not of antiquity, but of hoarier tradition, and without sound guides—for there is no trustworthy guidance in this field of conjecture. Everything before him is shadowy, intricate, intangible, vapor-like; yet he moves on with breathless earnestness, as if the traces could all be followed, the similarities and identities all established, and highly important results obtained. His efforts are stupendous. No ancient worshippers of the Cabiri, for instance, could ever have evinced more zeal and enthusiasm in searching for the history and connections of those strange, mythical beings than he evinces in treating, in chapter iv., of Cain—the slayer of his brother and builder of the first city—as a Cabirus; of the fratricide of the Cabiri compared with the fratricide of the Corybantes; of the Cabiric Adam of Samothrace; of Prometheus and Ætnæus as Cabiri in Bœotia; of the Dioscuri as Cabiri in the zodiacal sign of the Twins; of the month of the Twins, or of Brick-making, in the Babylonian calendar; of the consecration of this month to the god Shin; of Shin and Adar, Agamedes and Trophonius, Romulus and Remus, brick-making and city-building, twins and fratricide. And equal erudition and ingenuity are displayed, in the other seven chapters, on "The Creation of Man," "The First Sin," "The Kerûbîm and the Revolving Sword," "The Shêthites and the Qaînites," "The Ten Antediluvian Patriarchs," "The Children of God and the Daughters of Men," and "The Deluge." The very first pages of our author's comparative study of "the Bible and the traditions of Oriental peoples" acquaint us not only with the Protogonos, Æon, and Genos of the Phœnician Sanchoniathon—who are identified with Adam, Eve, and Cain—and the Egyptian deities Râ-Har-em-akhuti, Sekhet, and Khnûm, but also with the "*Alpa camasca*, Animated earth" of the non-Oriental Peruvians, with cosmogonic notions, kindred to those of Genesis, preserved by the Dayaks of Borneo, the Tahiti islanders, and the North American Mandans.

M. Lenormant's seemingly pedantic eagerness to multiply references is well displayed in a note (pp. 109–10) attached to a purely incidental mention of the brazen serpent of Moses. On this subject, in no way coming within the scope of the work before us, no fewer than the following authorities are *obiter* referred to, with full indications of book, edition, volume, and page: Ewald, Köhler, Oehler, De Wette, Kuenen, Tiele, Baudissin, Kern, Funk, E. Meier, and Menken. And yet it is not the sanctity of the Biblical topics that induces this indefatigableness in search and presentation, for he treats Biblical and heathen legends *nullo discrimine*. The Adam of the Pentateuch and Sanchoniathon's Protogonos, Eden and Tin-tir ki, are to him of equal authenticity. More than that, he unhesitatingly joins hands with the critics who have proved that the two parallel genealogies of Genesis iv. and v.—one of which enumerates in succession Adam (man), Cain, Enoch, Irad, Mehujael, Methusael, and Lamech, and the other Enos (man), Cainan, Mahalaleel, Jared, Enoch, Methuselah, and Lamech—"were constructed artificially and contemporaneously, in order to establish an exact and constant parallelism between the two lines of descent from the criminal and accursed son and from the just and blessed son," etc. (p. 186), and were so "formed by a systematic duplicating of a single primitive list" (p. 203), "a mode of procedure" agreeing with the Semite fondness for "the invention of names for allegorical personages," etc. (p. 196). All his illustrations, in fact, tend to prove that the antediluvian legends of Genesis are derived from Babylonian sources, and, though he believes them to have been carried into Palestine, from Ur of the Chaldees, "by the family of Abrâhâm," he is not at all averse to admitting "the fact that the Pentateuch, under the definite form that we possess"—as he cautiously states in the Preface—"does not date back further than the return from the Captivity." He has an excellent excuse for apparently so awful a heterodoxy in these words of St. Jerome: "Sive Mosen dicere voluerit auctorem Pentateuchi, sive Esdram ejusdem instauratorem operis, non recuso."

Protected by this shield, M. Lenormant gives us in the Preface—with what special object we do not know—a long, and almost naïve, profession of orthodoxy, coupled with a vindication of free criticism. "I am a Christian," he says, "and just now, when my belief may be a cause for reprobation, I am more than ever desirous to proclaim it emphatically." He "firmly" believes "in the inspiration of the Sacred Books," and subscribes "with absolute submission to the doctrinal decisions of the Church in this respect." But this submission extends only to that which concerns "faith and practice," and "does not at all interfere with the entire liberty of the scholar, when the question comes up of deciding the character of . . . narratives," their originality, or the date and mode of their composition. This liberty he has used within the limits of "strict fidelity to Catholic orthodoxy," even when he may have appeared "most daring." And daring he surely must appear to many, after these protestations, when, for instance, speaking of Chaldaic divination, of phyllomancy among the Assyrians, and of the prophetic tree Samurah of the Arabs before the days of Islam, he adds (pp. 95–6) that the manifestation of the angel of Jehovah to Moses, in a burning bush in the desert of Horeb, "belongs to the same class of conceptions." Frightened by this temerity, he hastens to assure his readers, in a note, that "this implies no doubt cast upon the reality or miraculous character of the occurrence." And he explains this surprising assurance in a way which, we must say, will satisfy neither the orthodox nor rationalists. The former, he tells us in the Preface, it would give him "much pain to scandalize"; "as to the pure rationalists," it will disturb him but little "should they smile at these scruples, which do not affect them." All this is very curious reading in a book in which Bible stories and the fables of idolatrous nations are compared, dissected, analyzed, identified, and shown to be equally childish and worthless.

Methods of Social Reform, and Other Papers. By W. Stanley Jevons, M.A., LL.D., F.R.S. London and New York: Macmillan & Co. 1883.

THE appearance of this book will revive the regret so keenly felt at the untimely death of the author. Whatever else might be said of his writings, they were always bold, vigorous, and stirring. The thing that his hand found to do he did with his might. The animated style showed an alert and enthusiastic mind, and in his very latest productions there was a youthful

optimism suggestive of years of experience in the future rather than in the past. Even to those who knew him only through his published utterances there was something pathetic in the sudden quenching of such a life, and it is easy to imagine that the loss to his family and friends must have been of more than ordinary severity.

Mrs. Jevons has collected in this memorial volume seventeen of her husband's papers and addresses, most of which, as the title indicates, were devoted to those questions which seem nowadays to be of the greatest interest to the more thoughtful class of English readers. Many of the subjects chosen, however, are so closely connected with the daily business of modern communities that they are of equal interest to Americans. We too are coming to be concerned in the "Amusements of the People," "The Rationale of Free Public Libraries," and "The Use and Abuse of Museums." We can no longer feel that "Trades Societies: their Objects and Policy" are exclusively English matters, from concern with which our free institutions have happily delivered us. The regulation of labor in factories, the regulation of the trade in liquor, and competitive examinations, are all subjects upon which it is necessary for intelligent people to have some information, or at least opinion; and, whatever may be thought of the conclusions laid down in these essays, or of the reasoning by which they are reached, it is a refreshing stimulus to every one to be conducted through these fields of discussion. Professor Jevons delighted in nothing so much as in facts and statistics, and we find in these pages much information that it would be impossible to obtain except from the daily conversation of men like himself. Of course, the specialist will not look here for an exhaustive treatment of his theme, but the general reader will find a convenient résumé of the best current thought upon a variety of subjects concerning which he does not like to confess himself ignorant. Even those whose pursuits necessarily require them to be familiar with the matters here treated may derive an advantage from this general review of the field of social reform. Professor Jevons's style is always easy, and we may safely recommend this book as not heavier for vacation reading than most of the summer novels.

It is a severe test of any one's consistency to bring together his utterances upon a great variety of topics during some fifteen years of active life, especially if that life has been such as to call for frequent public utterance of opinion. But, making every allowance for the lack of opportunity for revision and for the circumstances under which the essays originally appeared, it still seems undeniable that Jevons had never succeeded in developing in his own mind any consistent theory of politics, or even of social reform. He urges in one essay the acquisition of the telegraphs by the state; in the next essay, written some years later, he shows that the experiment had been an ignominious financial failure; while, in a third, after an interval of four years, he comes forward with unshaken confidence to recommend the Government to undertake the business of distributing parcels, or what in this country is called the express business. In the somewhat noted article on "Experimental Legislation," it is very clearly pointed out that, as laws are now passed, it is impossible to determine with scientific accuracy what their results really are. The community which they affect is so large, and exposed to so many influences, that we cannot assign a particular result to any definite cause. It would seem natural to conclude that local self-government would relieve this difficulty, for one community would be continually trying its own experiments, on a scale and under circumstances that would enable others to profit by their results. Instead of this, we have the proposition that Parliament should undertake to conduct these experiments, selecting certain boroughs as subjects for experimental laws. We know that Parliament is omnipotent, but we are inclined to consider that the conduct of a scientific experiment is beyond its capacity. As Sir James Stephen says, we should as soon think of getting a committee of the whole House to paint a picture. Still, it is a mistake to condemn this essay on the ground that we have no right to experiment on human beings. Every new law is an experiment, and, as it is about as likely to be disastrous as beneficial, it is certainly merciful to confine its operation to a small portion of the community until it appears that the whole will be the better for it.

But when Professor Jevons comes to treat of the disputes between masters and workmen, this confidence in the power of Government disappears. He even disapproves of arbitration, upon the ground that it tends to interfere with free competition. We notice in his discussion of this subject that he has unconsciously assumed, like many of the orthodox school, that the laws of political economy are laws in the same sense as the Ten Commandments. The moral sense of mankind, however, is not shocked by a violation either of the law of gravitation or the law of rent, and it is hard to repress a smile at the following remark concerning boards of conciliation: "The tendency of all such arrangements would surely be to destroy the freedom of individual action; and any such tendency is directly contrary to the undoubted truths of economical science, which we must unflinchingly uphold at the peril of unmeasured evils."

The recent telegraph strike will naturally give the essays on the Government and the telegraph a peculiar interest. We apprehend that their effect will be to dampen the ardor of those who are eager to have our Government engage in mercantile ventures of this nature. *Omne ignotum pro magnifico* is the major premise of most people's reasoning about the institutions of other countries, and it is not impossible that even those who ought to know have allowed themselves to assume that the business management of the departments of the English Government is good. It is truly consoling to a patriotic American to learn that that Government not long since sold ten or twelve tons of soldiers' buttons, which had never been taken from their wrappers, as old metal; and that the shrewd individual who purchased a condemned vessel for $10,000, sold back to the Government $20,000 worth of stores which he found in his purchase. We have not followed the later history of the English experiment, but it appears from Mr. Jevons's paper, which was published in 1875, that the Government had then laid out about fifty million dollars instead of the fifteen that they proposed, and that they were not then earning a half of one per cent. We might fairly expect that if our Government should manage no worse than that of England, we should get off with an expenditure of a hundred million dollars, and an annual loss of three or four million. It is well not to forget, too, that the Government pays no losses or damages arising from its negligence, and that it forbids all private competition.

Professor Jevons's fame is well established. It rests upon his admirable scientific treatises, and could not be increased by this publication. Yet we trust that this volume may further the pious intentions of his widow by arousing the interest of those who are unacquainted with his other works, and leading them to extend their knowledge. Those who have profited by his labors, and whose sympathies were excited by his death, will be glad to pay his memory the tribute of adding this book to their libraries.

A Bird's-eye View of Our Civil War. By Theo. A. Dodge, U. S. A. Boston: James R. Osgood & Co.

COLONEL DODGE'S history of the campaign of Chancellorsville was so admirable that we took up this later product of his pen with eagerness. It is impossible, however, to repress a feeling of disappointment upon reading it. It has many excellent characteristics: the style is simple and clear, the tone elevated and fair, the conception of military operations comprehensive, and the criticisms upon them judicious. The book is evidently as much the work of an experienced soldier as of a well-informed author. The diagrams that illustrate the text are good for their purpose, and, together with the maps, add greatly to the value of the book.

One of the defects grows, perhaps, out of the nature of the undertaking. The attempt to give in a moderate volume a sketch of the civil war which shall enter as much into particulars as this one does, is apt to result in a *syllabus* which, if accurate, may be of great use to the historical student, but will hardly serve to give the youthful or uninformed reader a clear and impressive picture. The young reader is apt to rise from the perusal of such a book with so great a load of names, dates, numbers, and localities, that his conception of the whole is quickly confused and soon fades entirely away.

More serious defects, however, are the many evidences of haste and inaccuracy. The undertaking, it is true, is a large one; but the data for the history of the war are very full, and of late years have been accessible. These data seem, in a number of instances, to have been very imperfectly used by Colonel Dodge. For instance, on page 54, Franklin is said to have gone up York River to make a demonstration from the White House (May 7, 1862), but made none because there was no enemy in that vicinity. Franklin was really within a mile or two of the Confederate line of retreat when he was driven back to Eltham's Landing. Again, on page 67, of the battle of Glendale or Frazier's Farm (June 30), it is said: "Our line stoutly resisted the attack of the enemy, which fell particularly upon McCall. But once during the day was a break effected by the Confederates, and Kearney promptly filled the gap." One would hardly infer from this that McCall was captured and his division largely scattered, and that on this day McClellan more narrowly escaped overthrow than on any other of the famous "seven days." Many persons will be surprised to learn from page 78 that Pope "had the advantage of the fighting" on August 29, 1862; and, from page 104, that on September 13 "an immediate march through the then undefended South Mountain passes would have enabled him [McClellan] to crush Longstreet." On this day D. H. Hill held the South Mountain (as he did next day, when the battle took place), and Longstreet was at Hagerstown. On page 106, McClellan's slow pursuit after Antietam is excused because of the disheartening effect on his troops of "Fredericksburg, Chancellorsville, and Manassas"—two of which reverses were yet in the future. Lee's strategy just before Gettysburg is misapprehended. His concentration at Gettysburg was to checkmate a movement of the Federal army toward Hagerstown, which Hooker had threatened. The battle was unexpected to both commanders. Colonel Dodge gives erroneously the numbers and losses at Gettysburg, of which the official reports are now all in print.

There are many such instances as the above. Halleck is blamed for Pope's defeat, Lincoln for

Hooker's feeble operations in the summer of 1863; Sherman's severities are all justified, while the burning of Chambersburg is unhesitatingly condemned, and no allusion made to the acts which led to it. Sheridan's laying waste of the Shenandoah Valley is, however, criticised. But Colonel Dodge's book is in no sense partisan. He pays high tribute to Confederate valor and leadership, and with deliberate judgment places Lee and Jackson at the head of the great soldiers developed by our war. The Chancellorsville and Vicksburg campaigns, and that of 1864 in Virginia, are the best done parts of the book.

Gatherings from an Artist's Portfolio in Rome. By James E. Freeman. Boston: Roberts Bros.

An old man's recollections of Rome in the forties must be pleasant reading. Why are there not more of them? is the involuntary question. The man who heard the announcement of Pio Nono's election, who soared in his first papal benediction, or who saw "the last of the gallants"—the old Polish and Hungarian nobles—dance the mazurka at the Princess (Colonna) Torlonia's balls, ought to have more to tell than we find in these pages. The bits from the studios and the stories of the models have a freshness that proves their truth. We shall not see the like again. Such an adventure as a pair of artists *painting* their way from Rome to Naples through the Abruzzi belongs only to a world where railroads and telegraphs are not. A glimpse of Thackeray is worth quoting:

"'By the by,' he added, 'is that extraordinary creature N——, about whom Macpherson used to tell me such odd stories, still living?'

"'Yes,' I answered, 'he is still alive, and as extraordinary as ever—'

"'Confound the fellow!' he interrupted. 'I was in hopes he was dead. I want to use him.'"

Here is the meeting between Sir Walter Scott and Thorwaldsen, described by Kesner, the Hanoverian minister:

"We make de appointment for de next day, and I accompany him, and present de two great genius one to de udder. Thorwaldsen not understand de English, and Sir Scott not understand de German or Danish language. Well, dey shake hand and look at each udder, wid much emotion and respect in dere eyes, for a little time widout a word. Dey could say notin, but de one know dat de udder was a great man, and dey were satisfy. . . . When de visit was finish dese two wonderful genius embrace one anudder wid great affection, and widout a word part. Dis was dere first and dere last meeting in dis world."

BOOKS OF THE WEEK.

Approved Text-Books

FOR

Schools, Academies, Seminaries, and Colleges.

Messrs. IVISON, BLAKEMAN, TAYLOR & Co. invite the attention of teachers and educationists to their list of publications as comprising many new and carefully prepared works, together with their well-known standard series in the several branches of study.

The above are embraced, in part, as follows:

SPELLING AND READING.

SWINTON'S WORD-BOOKS—Spelling and Analysis.
SANDERS'S SPELLERS.
SWINTON'S READERS.—A new and highly popular series, containing many original features.
THE NEW GRADED READERS.
SANDERS'S UNION READERS.
SHELDON'S READERS.
STANDARD SUPPLEMENTARY READERS.
CATHCART'S LITERARY READER.

DICTIONARIES.

WEBSTER'S DICTIONARIES.

MATHEMATICS.

ROBINSON'S PROGRESSIVE COURSE.
ROBINSON'S SHORTER COURSE.
FISH'S GRADED COURSE.—An entirely new series in two books. Meritorious, attractive, and cheap.
FELTER'S ARITHMETICS.

ENGLISH GRAMMAR.

KERL'S COMPLETE COURSE.
WELLS'S SHORTER COURSE.

GEOGRAPHY.

SWINTON'S TWO-BOOK SERIES.
GUYOT'S STANDARD SERIES.
GUYOT'S WALL MAPS.

*** The only two American authors of school-books who received gold medals at the Paris Exposition.

HISTORY.

SWINTON'S CONDENSED HISTORY OF THE U... STATES.
SWINTON'S OUTLINES OF UNIVERSAL HISTORY.
WILLSON'S HISTORY OF THE UNITED STATES.
WILLSON'S OUTLINES OF HISTORY.

PENMANSHIP.

THE SPENCERIAN SYSTEM OF WRITING.—Copy-books and charts.

DRAWING.

WHITE'S COMPLETE COURSE OF INDUSTRIAL DRAWING.

MUSIC.

LOOMIS'S PROGRESSIVE COURSE.

SCIENCE.

GRAY'S BOTANY.
DANA'S GEOLOGY.
GUYOT'S PHYSICAL GEOGRAPHY.
ELIOT AND STORER'S CHEMISTRY.
WELLS'S PHILOSOPHY AND CHEMISTRY.
COOLEY'S PHILOSOPHY AND CHEMISTRY.
TENNEY'S ZOOLOGY.
TENNEY'S NATURAL HISTORY OF ANIMALS.

THE MODERN LANGUAGES.

LANGUELLIER AND MONSANTO'S FRENCH COURSE (new).
MONSANTO AND LANGUELLIER'S SPANISH COURSE (new).
FASQUELLE'S FRENCH COURSE.
WOODBURY'S GERMAN COURSE.
MANTILLA'S SPANISH READERS.
MANTILLA AND PARLEY'S HISTORIA UNIVERSAL.

CIVIL GOVERNMENT.

TOWNSEND'S ANALYSIS.
TOWNSEND'S SHORTER COURSE.

BOOK-KEEPING.

BRYANT AND STRATTON'S STANDARD SERIES.

STATIONERY.

ALL KINDS OF SCHOOL RECORDS.
THE SPENCERIAN STEEL PENS.
THE SPENCERIAN WRITING FLUID.
PERRY & CO.'S STEEL PENS, etc., etc., etc.

Descriptive circulars and catalogues, giving special prices for introduction, will be sent on application. Sample copies will be furnished to teachers for examination at nominal prices. Correspondence is cordially solicited.

IVISON, BLAKEMAN, TAYLOR & CO.,
PUBLISHERS,
753-755 Broadway, New York.

BARNES'S

New National Readers

Will be ready in whole or part for the Fall Term of 1883. Attention of educators is invited to the following new Text-Books:

HISTORY:

BARNES'S BRIEF HISTORY OF GREECE. 12mo, cloth, 75 cents.

BARNES'S MEDIÆVAL AND MODERN PEOPLES. 12mo, cloth. Illustrated. $1.

BARNES'S BRIEF GENERAL HISTORY of ANCIENT, Mediæval, and Modern Peoples. 12mo, cloth. Illustrated. $1 75.

HISTORY OF ENGLAND. By E. M. Lancaster, Master of the Stoughton School, Boston. Revised edition, with maps, $1.

EPITOME OF ENGLISH HISTORY. By S. Agnes Kummer. A new edition, revised and edited by Miss A. M. Chandlee of Edgeworth School, Baltimore, Md. 60 cents.

MATHEMATICS.

BARNES'S NEW ELEMENTARY ARITHMETIC. 12mo, half bound, 30 cents; cloth, 40 cents.

Presenting the subject to beginners on a new and successful plan. This book has been received by teachers everywhere with great enthusiasm.

DAVIES'S NEW SURVEYING. From entirely new type and plates. Edited and revised by Prof. J. H. Van Amringe, of Columbia College, New York. A very valuable chapter on Mining and Surveying is added. 8vo, sheep, $1 75.

POPULAR ASTRONOMY. In Press. By Prof. Wm. G. Peck, of Columbia College, author of 'Peck's Mathematical Series,' 'Peck's Mechanics,' 'Peck's Ganot's Natural Philosophy.'

This work is scientific, but essentially non-mathematical, and, although especially designed as a text-book for colleges and higher academies, it is adapted to the wants of the general reader.

FRENCH.

GRAMMAIRE FRANCAIS. 12mo, cloth, 90 cents.

By J. H. Worman, Ph.D., Professor of Modern Languages at Vanderbilt University, and author of a series of French and German text-books, based upon the natural or pestalozzian method. Teachers have heretofore been compelled to resort to the use of such grammars as ... and Chapsal or Larousse, etc., which were made ... French people, and are not adapted to the ... needs of the English-speaking student. ... will be fully supplied by this work, ... of class-room experience, and, in its ... most thoroughly tested in the Adelphi Academy, ... lyn, before printing.

PHONOGRAPHY.

EAMES'S LIGHT LINE SHORTHAND. By Roscoe L. Eames, of San Francisco. A practical phonetic system without shading, for business correspondence and verbatim reporting. 12mo, cloth, $1 50.

This book is the result of years of study, experiment, and use, and has already been put out in four editions in various styles and forms. This is the first complete edition, and is printed from new type and plates. The illustrations are copious, there being 58 pages of engraved shorthand matter for practical work.

The work is highly endorsed by well-known stenographers as the easiest and shortest.

[Established 1848],

FOREIGN BOOKSELLERS & IMPORTERS,

Agents for the Teubner, Karl & Bernhard, Tauchnitz and Weidman Greek and Latin Classics.

Large stock of all Foreign Books used in Colleges and Schools.

A new edition of our SCIENTIFIC CATALOGUE, a list of the best and most recent German, French, English, and American Books on Applied Science, especially Electricity, Chemistry, Metallurgy, Mechanics, price 15 cents, nearly ready.

Dr. Sauveur's Educational Works.

Sold by F. W. CHRISTERN, New York;
CARL SCHOENHOF, Boston;
JOHN WANAMAKER, Philadelphia;
ROBERT CLARKE, Cincinnati.

Just Out:

LA PAROLE FRANCAISE.
ONE DOLLAR.

It will be addressed, post-paid, to teachers who will send 50 cents to Dr. L. SAUVEUR, Randolph, Vt. Any of the other works of Dr. Sauveur may also be obtained for examination by sending half the retail price to the author.

Circulars will be sent to applicants.

MR. T. FISHER UNWIN,

Publisher, 26 Paternoster Square, London, E.C.,

Will be happy to forward, post free, his NEW CATALOGUE OF BOOKS, as published to the Trade and Book-buyers, on receipt of address, which will be registered.

GERMAN rapidly and conversationally taught in a few months. Send for circular.
JULIUS, 27 Union Square, Room 13.

The Nation.

NEW YORK, THURSDAY, SEPTEMBER 27, 1883.

The Week.

THE Machine leaders who have returned from the New York Republican Convention express themselves as greatly delighted with its work, and as convinced that the party is in a better and more harmonious condition than it has been for many years. They may be right about it, but a great deal depends upon what happens within the next four weeks. The Democrats may take such action as will repel all Independent sympathy, and in that case the Republican ticket would receive unexpectedly large support. Fortunately it is made up of quite unobjectionable persons, all but one of whom have had experience in the offices for which they are nominated, and have shown themselves fully competent for their duties. The nominee for Treasurer is little known, but there is no reason to think that he is below the general average of the rest of the ticket.

There is some difference in tone between the platforms of the New York and the Massachusetts Republicans on the tariff and steamship-subsidy questions. The Massachusetts platform favors "well and wisely matured laws, to protect and develop American industry and enterprise both at home and on the ocean." Nothing could be more colorless than this definition, and when we reflect that it proceeds from a State in which manufacturing is the largest of all industries, and has always been the most potent influence in national politics, we are not a little surprised to see how faint an interest appears to be taken in the subject of duties on imports. The New York platform favors "a system of tariff laws under which, while revenue for the Government is provided, American producers are justly protected, American labor elevated, and home markets are secured to home products for the advantage alike of the producer and laborer"; also "the removal of all unjust burdens upon American shipping, and the awarding of ocean mail contracts to the lowest bidders among owners of American vessels after open competition." Thus the New York platform, though not so favorable to the existing system as some former utterances from the same quarter have been, shows a stronger leaning toward protection than that of the Massachusetts convention. The difference would appear to signify that the experience which the Massachusetts manufacturers have had of the tariff has not been so favorable on the whole as it has been to the politicians of New York, who probably drew their platform to suit what they conceived to be the general belief and inclination of the party rather than from any critical survey of the present state of "American industry." There is nothing, however, in either platform which would estop the Republican party from overhauling and reducing the tariff again this winter.

Mr. Robinson, the Republican candidate for Governor of Massachusetts, has defined his position on the question of prohibition with commendable clearness. He says that in his opinion the present local option "is all that the people will enforce, and a law that the people will not enforce is of little effect in any State." The present law in Massachusetts gives any town the power to adopt a prohibitory law for itself by a majority vote of its citizens, and experience has shown that this is as far as a State can wisely go in the matter. Sweeping prohibitory enactments which public sentiment does not sustain, have been aptly designated as "legislation by hurricane" by so uncompromising a teetotaler as John Bright, and the class of temperance advocates who still insist upon them or nothing grows smaller every year. There are assurances that they are fewer than ever in Massachusetts this year, and that consequently General Butler's assistance from that quarter will be perceptibly diminished.

An application of the prayer-gauge to politics has been made in Massachusetts, and, if we correctly understand the report of the applicant, the Rev. Mr. Gifford, the experiment was not successful. Mr. Gifford offered prayer at the opening of the Republican Convention, supplicating for its delegates wisdom in the choice of candidates and principles. On the following day he took part in the Prohibition Convention, and made a strong anti-Republican speech, thereby tacitly confessing that his prayer of the previous day had not been granted. He told the Prohibition Convention that he wanted to "hoe up things"; that he was afraid the Republican carcass would rot and he catch a fever; that he didn't see any sense in dissolving the "pearl of his vote in the vinegar of a Republican nomination," and that the Republican party was "doomed." Finally he said he was willing to pray for anybody, even for the Democratic party. Mr. Gifford's generosity is equalled only by the spiritual simplicity and elegance of his speech; but he impairs the demand for his own services as a prayer-gauge in politics by admitting so freely that his petitions have no effect.

Mr. Leon Abbett, the Democratic candidate for Governor of New Jersey, has accepted the nomination with a few informal but incisive remarks, which are calculated to arouse great enthusiasm among his followers. He declares that he shall know no faction in his canvass; that every man who works for his election will be to him a Democrat, and that after his election the "Democrats that will be rewarded will be the ones who do the work of the campaign." That puts the candidate squarely in line with the platform upon which he stands, which denounces the "sham methods" of the Civil-Service Commission, and favors a "deep-reaching" reform. It is a deep-reaching reform which Democrats everywhere are yearning for. Different names have been given for it, but the main idea is the same in all. Governor Butler's definition is the comprehensive one that the "Government belongs to its friends." Senator Thurman described the reform as "taking the boys in out of the cold and warming their toes." Mr. Abbett discriminates a little and favors reward for the "workers" only. The *Sun* sustains the general position of the party handsomely when it says that the "first step toward a reform of the civil service is to turn the rascals out—the Republican party must go." The old name for this kind of reform used to be a "clean sweep."

The efforts of Governor Hamilton to induce his Democratic followers in Maryland to join him in turning their own rascals out have not been successful. A few weeks ago the Governor showed in a public letter that his party had been committing gross abuses in the administration of the State's affairs, had stolen large sums of money from the treasury, and had increased the public expenditures by unnecessary additions to the lists of State employees. None of his statements have been controverted, or even disputed. The party has "ignored" them. Its delegates met in Convention last week, nominated a new candidate for Governor, and resolved that the election this year was most "momentous" because of its effect upon the national contest of next year. An attempt to have an endorsement of Governor Hamilton's course incorporated in the platform received only ten votes, but the whole Convention voted enthusiastically in favor of a scathing denunciation of Republican fraud and corruption in national affairs. It seems to be evident from this, that in the eyes of the Maryland Democrats the Republican rascals are the only ones who ought to "go."

The distrustful, do-nothing attitude of capital continues to be the most prominent feature of financial affairs, notwithstanding the fact that it is now settled that we shall have at least good average crops of all kinds; that trade prospects, both domestic and foreign, are at least fair; that railroad earnings are good, and that the industry of mills, factories, and mines is increasing a little. More money lies idle in the banks than has ever been known to do so before at this season of the year. It is offered freely for loan on collateral security at unusually low rates of interest, but it is not loaned freely in any other way. The expansion of the railway system of the United States in the last few years, and the completion within the past few months of three new lines to the Pacific coast, and as many more new trunk lines between New York and Chicago, has created a disposition to wait and see how nearly the growth of the country has justified such an increase of transportation facilities, before investing in the securities that represent the means of transportation. The result of all this is that prices of railway securities generally are lower. The continued redemption of Government bonds temporarily puts more and more funds out of employment in that line, but they do

not seem to find new employment in other lines. On the other hand, the redemption of bonds has now reached a point where it must soon begin to affect the volume of the currency, as the national banks will shortly begin to surrender their circulation with the further calling in of bonds. There have been some small imports of gold in the last week (2,500,000 francs from Paris), but the rates for sterling exchange are still above the specie-importing point, and as our exports are less than last year at this time, and as European capital is not buying any American railway securities at the present moment, there is no immediate prospect of imports of specie to any considerable extent.

The satisfactory condition of general trade and the rickety condition of the stock market continue to show the same contrast upon which we commented a short time ago. The explanation may probably be found in the fact that railway building has advanced in the past two years in a higher ratio than agricultural production. This is shown very clearly in an article in the *Railroad Gazette* of September 21, and is confirmed, if confirmation were needed, by the recent remarks of Commissioner Fink to the Senate Committee on Labor and Education. The increase of acreage brought under cultivation has been about 2 per cent. yearly since 1879. The increase of population has been about the same, while the increase of railway mileage has been about 9 per cent. yearly. These facts are sufficient to account for the otherwise surprising fact that the general business of the country is in a fairly prosperous state, while the stock market, which deals chiefly with railway properties, is in a depressed and feverish condition.

Mr. Erastus D. Goodwin, a Connecticut farmer, gave the Senatorial Labor and Education Committee on Thursday some of the soundest information which they have come across during their investigation. Mr. Goodwin evidently belongs to that estimable class of New England citizens who are honorably known among their townsmen as being "hard-headed." He told the Committee that the Government should not interfere with labor and trade, or meddle with educational systems; that a healthy competition was necessary to the development of resources; that under existing laws this country was not permitted to compete with foreign nations in the markets of the world as she was fully able to do; that her ability to produce was restricted by restricting the markets for her products; that if competition in trade with other nations could be secured, the wages of workingmen would not be lowered, but that on the contrary their compensation would increase with the general growth of prosperity; that so long as a high protective tariff exists, the American laborer will be at a disadvantage; that protection fosters monopolies of every kind; that it taxes all industries for the sake of enabling a few to make money; and that the agricultural interests are obliged to bear the heaviest burdens, receiving nothing in return. If heretical views of this kind are percolating through the minds of the rural voters of New England concerning the blessings of a protective tariff, there is no telling what may happen.

The *Herald* makes the very sensible suggestion that the Senate Labor Committee should "move on," and give the other cities of the Union a chance. We shall be very sorry to lose it, for its researches into the relations between labor and capital have been far more entertaining than any similar investigation that we can remember, and it has converted what promised to be a dull statistical inquiry into a political and economical variety show, in which all the star performers of the city have had an opportunity of giving specimens of their talent, and a good many new ones, of whom the public might otherwise have remained in entire ignorance, have made their first appearance. These have compared very creditably with such old favorites as Mr. Swinton and Mr. Thurber, and the season has, as a whole, given a gratifying proof that the resources of the country in this field are inexhaustible. But Mr. Blair ought to give Boston and other cities a chance, too. He must have a few dates still unfilled.

The *Tribune* is disturbed by the signs of a decline in the profits of cotton-spinning in England under the operation of free trade, for although the business has increased enormously in the past twenty years, the profit on each yard of cloth manufactured has fallen to a dangerously low point. We believe that this is true, and that the same result has been witnessed in America, where free trade has not been introduced as a factor to depress the profits of the manufacturers. The "tendency of profits to a minimum," as the world grows older, is a fact long since recognized by writers on political economy, and one which is confined to no country and to no industrial system. Recent auction sales of domestic dry goods in this city show that profits have not only been reduced to a minimum in certain lines of manufacture, but several degrees below zero. If English weavers are making no higher rate of profits than our blanket manufacturers, their condition must be pitiable indeed.

Governor Thompson, of South Carolina, whose independence in resisting the pressure of office-seekers and their friends we commented upon last January, has recently shown himself a reformer in another direction. His private secretary and the Secretary of State had lately a quarrel, which led to blows, about an accusation made by the latter concerning a Mr. Gonzales, a friend of the former. The Governor, apprehending a serious difficulty between Gonzales and the Secretary of State when the full account of the altercation should become known, immediately endeavored to pledge the two to an observance of the peace. Mr. Gonzales, refusing to promise that he would "pursue the matter no further," was promptly put under bond by a trial justice upon the application of the Governor. At the hearing of the case it appeared that Governor Thompson had no knowledge of an impending difficulty. He had only heard that it was the intention of Gonzales to denounce the Secretary of State for his offensive language, and he believed, from his "knowledge of both of them," that a serious breach of the peace would be the result. We do not know of a more simple and effectual mode of diminishing the number of homicides in the Southern States than that employed by Governor Thompson. In a community where the giving of the lie, or the using of any offensive language to another, is followed generally by a breach of the peace, the party denouncing and the party denounced should be at once put under bond before they have had an opportunity to get at each other and cast gloom over the neighborhood. To this end we suggest the establishment in the South of societies for the prevention of homicide whose members shall on all similar occasions act as Governor Thompson has just done. At present, in the South (we quote from the Charleston *News and Courier*), "the average citizen does not consider it his business to prevent a personal encounter, and will no more interfere with it or impede it than he would in the case of a dog in the gutter. The common feeling is, that each one must look to his own strength and skill for redress and protection."

The investigation of the frauds in the Water Bureau has been completed, and the total misappropriation is placed at $26,000. Of this amount the city will lose at most not more than $6,000, and possibly much less than that. The remaining $20,000 or more will be paid into the treasury by the consumers who were either sharers in the frauds or the innocent victims of them. The "ring" had two methods of working. The most prolific one was to send an agent to a large water consumer and offer to reduce his bill a third, or even a half, if he would pay it to a person outside the Department. The money collected in this way was nearly all stolen, and the consumers who made this robbery possible will have to make good the city's loss now. Some of them profess to have been innocent of any fraudulent intent, but many of them attempt no explanation, but promptly pay over the amount demanded. In this way $8,000 has already been paid in, and the other $12,000 will soon follow. The consumers who consented to pay the reduced bills are said to represent nearly all kinds of business, and some of them are said to have been entirely innocent of intent to defraud. If so, they must suffer the penalty which excessive innocence is bound to pay sooner or later. The tax bills of the Water Bureau state expressly that no money must be paid to any one outside the office of the Bureau, and this injunction appears to have been sufficiently well understood to prevent consumers from paying their full taxes to any "ring" agent. It was only when the agent appeared with an offer of reduction that the consumers permitted themselves to forget the injunction. The second method was limited in its operation. It could only be practised in cases where a consumer had two or more establishments and used more than one meter. In such cases separate bills were made out for each meter, and if the consumer sent in payment a single check for all amounts, it was the practice of the ring clerks to give him credit in only one place on the books, and appropriate the difference, though sending

him a receipt for the full amount. In such cases the consumer was in no way involved in the theft, and the loss will fall upon the city. Commissioner Thompson's course in investigating these frauds has been a great irritation to some of the newspapers, but it has been completely vindicated by its results.

Mr. Merritt, our Consul-General in London, has sent a report to the State Department on the great "Bradford Estate," amounting to $100,000,000, lying in the vaults of the Bank of England. This sum was deposited in the Bank by Mr. Bradford, the first Governor of Plymouth Colony, a couple of hundred years ago, subject to check, whether for the purpose of using it for speculation in stocks or some other object, is not now known. Mr. Merritt asked Mr. S. O. Gray, the chief accountant of the bank, about it, and Mr. Gray, of course, denied all knowledge of any such money. He says: "There is no unclaimed stock or money recorded in the books of the bank in the name of Governor William Bradford, nor is there, so far as I am aware, any foundation for the assertion that there is." The foundation for the assertion is that Governor Bradford left heirs behind him who have grown into a numerous family, and they want the money. They should, however, not be at all discouraged by Mr. Gray's disclaimer. The Bank never admits the existence of deposits of this character.

The monthly reports of the municipal laboratory which analyzes "claret" in Paris are, it is said, attracting the unfavorable notice of the wholesale wine merchants, and an attempt is to be made to suppress them. A curious illustration of the condition of wine manufacture in France is furnished by the fact that dealers are flooded with prospectuses, circulars, and advertisements, puffing up the different varieties of powders and liquids used in the artificial coloring of wine. Some claret venders think well of "Roussillon Concentrated," others of "Lynoline," others of "Bordelaise Colorant." The widespread publicity given to such facts ought to affect the market in the course of time. The idea that the wholesale dealers will meet this difficulty by getting the laboratory reports suppressed, comes from Mr. Wilson, our Consul at Nantes.

The French press has been thrown into an unusual excitement by an editorial article in Katkoff's *Moskovskiya Viedomosti*, the leading journal of the old Russian capital. Though far from being an exponent of public opinion in the Empire of the Czar, this journal now more than ever reflects the views of the innermost Imperial circle. Katkoff became the idol of Russian nationalists when, on occasion of the Polish insurrection of 1863, he dethroned Hertzen, the idol of the cosmopolitan radicals, and proclaimed a crusade against the insurgents. He has since become more and more reactionary, and has lost prestige among the enlightened classes, but he is known to be the oracle of the Minister of the Interior, Tolstoi, and his friends, and through them a kind of political mentor to Alexander III. He has of late assumed an intensely hostile tone toward the French republic, in face of the French sympathies of the entire nation, and he now speaks of a Franco-Russian alliance as an absurd supposition. He taunts France with pusillanimity, and her Government with fickleness and impotence. What Power, he asks, would seek an alliance that is not certain to last for a day? And why should Russia seek such an alliance? What are Alsace-Lorraine and French *revanche* to her? France was formerly always an enemy of Russia, Germany has been her constant ally. The interests of Germany and Russia are identical.

What makes this language the more galling to the French is the circumstance that the St. Petersburg *Viedomosti*, a more direct organ of the Czar's present Government, faithfully re-echoes these anti-French sentiments of the powerful Moscow journalist. Its tone shows clearly that the attack on the French Government is, in reality, aimed at its republican form, which not only is essentially distasteful to the ruling men at the Russian court, but, through the frequent change of cabinets and policies, and the ill-considered military adventures resulting from it, renders a stable and reliable Continental diplomacy impossible. The foreign statesmanship of St. Petersburg is evidently disgusted with France's exploits in Tunis, in Madagascar, in Tonquin, while not daring to uphold her interests in Egypt, or to lift a finger against Austria—not to speak of Germany—and letting all Southern Europe drift into the equally anti-French and anti-Russian alliance framed by Bismarck. The French journals, and conspicuously among them the *Parlement*, retort sharply, attributing the offensive effusions to Legitimism wounded by the death of the Comte de Chambord, and twitting the pro-German political guides of Russia with her growing isolation in the east of Europe and the desertion of Servia and Rumania. The controversy must be pleasant reading in Berlin.

"General" Booth, the Commander-in-Chief of the Salvation Army, is waging the war against sin in London under peculiar conditions. About a year ago the Army acquired a seventeen years' lease of the Eagle Tavern, which had attached a theatre, music hall, and grounds. It was dedicated to its new uses with a great demonstration, and General Booth declared that although he was obliged by the terms of his lease to take out a yearly license, no intoxicating liquors should be sold at the Eagle while he had control. The theatre and music hall were accordingly converted into places of public worship, and an inscription was hung upon the front of the building announcing that it was devoted to the work of salvation. Recently a suit was begun for possession of the property, and was decided against the Army. An appeal was sought, but the Court ruled that appeal could only be granted on condition that the tavern revert to its former uses—that is, that intoxicating liquors should be sold there under the terms of the lease. Rather than lose his property, the General reopened the bar, took down the salvation inscription from the front of the tavern, and put out a sign inscribed: "William Booth, licensed to sell by retail intoxicating liquor, to be consumed either on or off the premises." This will be continued until the appeal is decided. While the Army is conducting services in the theatre and music hall, the bar will be doing a brisk business in the other end of the building. One would think that the effect of complicated missionary work of this sort would be confusing to the mind of the sinner. For the sake of retaining possession of some purely temporal riches, the General is engaging in a business which he believes to be immoral and wicked. We are not able to understand by what process of reasoning he is able to do this—but then few people ever have been able to comprehend fully the scope of much of the Salvation Army's mission.

An important change has taken place in the political régime of Bulgaria. Prince Alexander has returned to constitutional ways—as they were observed before his *coup d'état* of 1881; the ministerial Government of the Russian army officers, General Soboleff and Baron Kaulbars, has come to an end; and M. Zankoff, the lately exiled leader of the Bulgarian Liberals, is again at the head of a national Cabinet. The general drift of the telegraphic news from Sophia, however, has been rather obscure during the last few weeks. First there came the announcement that Prince Alexander, in order to insure a stable condition of affairs, had resolved on appointing a commission for the framing of a new constitution, to be laid before a special National Assembly. This "manifesto" was immediately after explained as having been extorted from the Prince by the Russian Envoy, M. Yonin, who threatened an immediate open rupture on the part of Russia if he did not consent to the continuance of Soboleff and Kaulbars's rule. Then we heard of a conspiracy discovered in the Bulgarian capital against Soboleff and Kaulbars, and baffled by arrests. The opening of the Bulgarian Assembly by Prince Alexander, on September 16, was next reported. This seemed to refer to the special national gathering which was to approve of a new constitution. Finally, we are informed that the Prince, in answer to the address of the Assembly, has declared his readiness to reëstablish the Constitution of Tirnova, which he arbitrarily set aside in 1881, and that, dismissing the Soboleff-Kaulbars Cabinet, he has intrusted M. Zankoff with the formation of a new ministry. This termination is the result of long agitation against the Russian officers, of their breach with their Conservative Bulgarian fellow-ministers, and of a compromise lately entered into by Zankoff on his return from exile with the chief of the Conservatives, Natchevitch. But what, in the light of information obtained previously to the late telegraphic reports, requires further explanation is, whether the "Constitution of Tirnova" means the old charter of 1879 pure and simple or modified in accordance with a new draft, and whether Zankoff's new Cabinet is to be an unalloyed Liberal or a coalition ministry in which there is room for Natchevitch and his friends, or even—as was recently foreshadowed—for the Russians displaced from the headship of the Government.

SUMMARY OF THE WEEK'S NEWS.

WEDNESDAY, September 19, to TUESDAY, September 25, 1883, inclusive.]

DOMESTIC.

THE New York Republican State Convention met at Richfield Springs on Wednesday noon. Senator Lapham was elected temporary Chairman and made an effective address. Senator Miller, as permanent Chairman, spoke at length of the necessity for a more liberal organization of the Republicans of the State. The following nominations were made: For Secretary of State, Joseph B. Carr; for Comptroller, Ira Davenport; for Attorney-General, Leslie W. Russell; for State Engineer and Surveyor, Silas Seymour; for State Treasurer, Pliny T. Sexton. This is the old ticket, with the exception of the last-named candidate. The platform approves of President Arthur's Administration and of the successful inauguration of civil-service reform; favors a tariff for revenue and protection of American producers; asks for a revision of the primaries, a check to monopolies, and an equalization of taxes; approves the plan of party reorganization in the city of New York, and recommends that it be persisted in, to the end that it may embrace all Republicans in the city on equal terms and feeling; and asserts belief in the wisdom of the people in deciding all questions pertaining to the public welfare, and readines to accede to the desire of a large body of our citizens to submit to the voters of the State a constitutional amendment in regard to the manufacture and sale of intoxicating liquors. John F. Smyth and Thomas C. Platt, Stalwarts, were not reëlected members of the State Committee.

There was a bolt on Monday in the Republican Senatorial Convention of the Twenty-first New York District. Senator F. E. Lansing was nominated by the regular delegates. Some Stalwarts nominated Manister Worts, of Oswego.

The Massachusetts Republican State Convention, which met in Boston on Wednesday, was considered the finest body of Republicans which has met there in recent years. It contained 1,291 delegates. Chairman Lodge, of the State Committee, called the Convention to order and made a speech which was received with enthusiasm. His allusions to Butler called out a quick response. Colonel Codman, as President of the Convention, made an address in which he emphasized the achievements of civil-service reform. Colonel Codman's long review of the Tewksbury case and his scathing attack on Governor Butler for his course were interrupted so many times, and in such a spirit, that it was evident the Republicans do not fear the Tewksbury issue. An informal ballot resulted as follows: George D. Robinson, of Chicopee, 996; Charles Francis Adams, jr., of Quincy, 117; George A. Bruce, of Somerville, 35; Thomas Talbot, of Billerica, 6; all others scattering in ones and twos. The announcement of the informal ballot was received with applause, and Charles Francis Adams, jr., was greeted with shouts as he rose to move to make the ballot formal, and that Robinson be nominated by acclamation. He made a vigorous speech against Butler, and then his motion was carried unanimously. Mr. Robinson was brought in and made a speech. Other State officers were nominated.

On Thursday the Massachusetts Prohibition State Convention met in Boston, and nominated Charles Almy for Governor.

The Massachusetts Greenback State Convention met on Tuesday. The temporary Chairman made a short address eulogizing General Butler, whom the Convention then nominated for Governor.

The Democratic State Convention of Maryland met at noon on Wednesday in Baltimore. It was under the control of the old ring. Robert M. McLane, of Baltimore, was nominated for Governor. The platform demands "that national taxation, in all its forms, shall be limited to such amounts as are necessary for the economical administration of the Government, for the payment of interest upon the public debt, and for the redemption in each year of a fixed and reasonable proportion of that debt."

The Colored Men's Convention held its opening session at Louisville, Ky., on Monday afternoon. Twenty-seven States were represented by about 300 delegates. The meeting was very disorderly during organization. Fred Douglass was proposed for temporary Chairman, but his name was withdrawn after a vigorous speech against him. Mr. Green, of Louisiana, was elected to the place. Mr. Douglass was also a candidate for permanent Chairman. He was severely arraigned by W. H. Young, of Tennessee, for his declaration in favor of Ben Butler for President. He was elected, however, after a bitter contest of eight hours' duration. On Thursday morning a very large audience assembled to hear his inaugural address. In the course of it he said: "This stamping out of the black Republicans of the South has been done in the face of the Republican party. This convention should implore Congress for the restoration of justice, and for the abolition of this most detestable state of affairs. Elevate one of our class to the Vice-Presidency or to a position in the Cabinet, and our equality shall have been established. We are not prepared for this as yet, but let us aspire to those positions which we can fill. We hold it self-evident that a nation made up of all varieties should not be governed by one class. Where there is a ruling class there is a subject class, and when the day comes when this nation is governed by one class it ceases to be a government of the people, for the people, and by the people." A motion that the address be adopted as that of the Convention led to serious opposition from those who hold that Mr. Douglass is leading a covert attack on the Republican party. The address was finally referred to the Committee on Resolutions.

The bureau officers of the Treasury have prepared estimates of the probable receipts for the year, together with the amounts required for pensions and expenses. They state that the surplus will warrant a call of $45,000,000 more of the 3 per cent. bonds. One reason why this call can be made is that the expenditures for pensions will fall about $40,000,000 below the estimates.

The Secretary of the Treasury has decided the questions, which have been pending before him for some time, in regard to duties on iron under the new tariff. The provision for charcoal iron is held to relate only to the iron which is otherwise dutiable under the paragraph in which it is found. The provision for rivet, screw, nail, and fence-wire rods is held to govern the rate of duty on these articles, notwithstanding the apparent provision elsewhere in the tariff for iron of the size and value named in the paragraph relating to rivet, screw, nail, and fence-wire rods.

Secretary Folger, in his annual report, will renew, it is asserted, his recommendation for the consolidation of many of the minor customs districts, the revenue from which is very much less than the expenditure.

Supervising-Architect Hill, on Monday, handed in his resignation to the Secretary of the Treasury. He has addressed a long letter to Secretary Folger in defence of his administration, and in answer to some of the findings of the Investigating Commission. He thinks the Committee reached conclusions which neither the law nor the evidence justifies, have made grave mistakes in the application of the evidence, have failed to appreciate the value of certain testimony, and, in their interpretation of the law relating to advertising, have given a construction to it in accordance neither with its letter nor with its spirit.

The requisitions upon the Post-office Department for the new two-cent stamps are so large that the contractors are unable to supply the demand, and the Department is reducing the amounts called for in the requisitions. It is believed that fully one-third of the post-offices will not have an adequate supply of stamps when the new law goes into operation on October 1.

The famous Niobrara Star-route has been discontinued at the instance of the Post-office Department on substantially the same grounds as those set forth last spring in the protest of Senator Van Wyck, of Nebraska.

Chief Engineer Melville has submitted plans to the Navy Department for an expedition for the relief of the Greely party this fall, volunteering to take charge of the expedition. Secretary Chandler has the plans under advisement. It is said that President Arthur has recently expressed himself as opposed to risking valuable lives in Arctic expeditions.

The lines of the Central and South American Telegraph Company were successfully opened on Friday between this city and Brazil. The first message sent was from President Arthur to the Emperor.

The report of the Auditor of the State of Ohio, which has just been completed, shows the collections under the Scott liquor-tax law to have been nearly $2,000,000, which has been distributed in localities where collected to the police, the poor, and to the general revenue and township funds.

Mayor Low, of Brooklyn, on Monday afternoon submitted to the heads of the Brooklyn departments and other city officers the civil service regulations prepared by him under the act passed at Albany last winter. The rules, which do not apply to elective officers or to the police, law, health, fire, or education departments, provide for the appointment by the Mayor of three examiners, two only being of the same political faith, the terms of the first to end January 31, 1884.

The fourth Provincial Council of the Roman Catholic Province of New York was opened with elaborate ceremonies at St. Patrick's Cathedral in this city on Sunday. Cardina McCloskey presided. The bishops of all the dioceses of the province and Catholic dignitaries of various ranks, theologians, representatives of the religious orders and educational institutions of the Church, priests, deacons, and sub-deacons took part. This is the first council of the province which has assembled since 1854. It was in secret session on Monday and Tuesday.

John A. Feeney, an Irishman, aged twenty-six, entered the British Consulate in this city on Tuesday, and fired two shots from his revolver in the outer room. He did not take any definite aim and no one was injured. A policeman soon arrested him. His appearance was sickly, and he said that he had recently been discharged from a hospital in Buffalo. He declared that he had come from Canada on purpose to kill the British Consul, who had been libelling his character. It was evident that he was of unsound mind.

F. Mayer & Co., dealers in woollen goods, of this city, made an assignment on Tuesday to H. Danzig, giving preferences to the amount of $810,513. The total liabilities will amount to about $1,600,000. The assignee says the assets are very large. Other failures in the cloth trade were announced later in the day, among them Levy Brothers & Co., who gave preferences for about $900,000. The total liabilities are about $1,500,000.

The passenger-rate war on tickets between Chicago and Louisville reduced the fare to $1 on Friday. The war was extended on Monday by a cut of rates to Indianapolis, Cincinnati, and other points, by the Louisville, New Albany and Chicago Railroad, in competition with the Panhandle.

By the wreck of a construction train on the West Shore Railroad, near Syracuse, on Wednesday, three men were killed and sixteen injured.

The Rev. Dr. Edwin F. Hatfield, for many years a prominent member of the Presbyterian Church in this city, died at his home in Summit, N. J., on Saturday morning, of heart disease. He was elected Moderator of the General Assembly at the last annual meeting.

William A. Norton, Senior Professor at the Sheffield Scientific School, Yale College, died on Friday at the age of seventy-three.

Calculations based upon observations of the comet recently discovered by Mr. Brooks have just been completed by Professor Boss, of the Dudley Observatory, Albany. They show that this comet is identical with the Pons comet of 1812, so long expected. It is rapidly increasing in brightness, and is now visible through low-power telescopes.

FOREIGN.

The American Minister to China has joined with the English representative in urging China to come to an understanding with France. The American mercantile marine has received an intimation from France that all vessels carrying war materials to Tonquin will be captured as prizes by the French navy. It was admitted in Paris on Thursday that General Bouet had been relieved of his command in Tonquin by the French Civil Commissioner Harmand. The General admitted that he had been unable to hold his position after the last fight. Marquis Tseng on Thursday telegraphed the French memorandum to Pekin. On Friday it was announced that the French had suffered another check in Tonquin, their Yellow Flag allies having been defeated near Hai-Phong. On Monday it was reported from Paris that the reply of the Government of China to the memorandum of the proposals by the French Government had just been received. It was said that the response favors the theory of a division of the neutral zone of Tonquin. The report was denied by Reuter's Company on Monday evening.

A Calcutta despatch to the London *Times* asserts that the published account of the French outrages at Tamatave falls far short of the truth, and adds that when the English Consul, Mr. Pakenham, was dying, the French priests endeavored to force him to become a Catholic, and compelled him to kiss the crucifix. It is also reported that Missionary Shaw's residence was looted, and he was threatened with punishment by the French officers because he failed to remove the débris caused by the ransacking.

A despatch to the London *Daily News* from Vienna asserts that Russia is making extensive military preparations along the Austrian and German frontiers. Tenders have been asked for 36,000 military beds. All the railways have been ordered to have military cars in readiness. A list has been made of the private steamers in the Black Sea, and their captains have been ordered to prepare for the transportation of ammunition, troops, and provisions.

The London *Standard's* Berlin correspondent says that he is in a position to deny that the Emperor William and the Czar will hold a conference this year. The relations between Russia and Germany are excellent, and there is no necessity for such a meeting. The Paris *Diplomatic Gazette's* London correspondent says: "The Austro-German alliance is directed against Russia and France. In the event of a war between Germany and France, Austria is to maintain an armed neutrality. In the event of a war between Austria and Russia, Germany is to do likewise. If a third Power attacks Germany or Austria, the armed neutrality will be converted into active coöperation."

The *Narodnaya Volya*, the chief Nihilist organ, is being secretly printed in St. Petersburg. In a recent publication it reviews the work of Count Tolstoi, the Minister of the Interior, and says a continuance of a similar policy cannot be tolerated. "The days of Tolstoi, the hangman," it declares, "are numbered."

A conspiracy among Servian Radicals has been discovered. A quantity of dynamite and arms were found in the possession of Radical leaders at Pozega. The Ministry is awaiting the return of King Milan before taking any decisive step in view of the defeat of the Government at the recent elections.

While the troubles in Croatia are less vigorous, the agitation is spreading to Dalmatia. Proclamations have been distributed summoning Dalmatia to make common cause with Croatia.

The Emperor William, King Alfonso, the Prince of Wales, and the Dukes of Edinburgh and Connaught witnessed the races which took place at Homburg on Sunday. Emperor William drove to Erlenbach on Saturday morning, where he met the royal guests, and proceeded with them to the field to witness the military manœuvres. Twenty-five thousand men participated. On Monday the royal party witnessed more of the manœuvres.

It is asserted that the scheme of a customs' union between Belgium and Holland is about to be effected. Bismarck having approved the scheme, it is believed to be the first step toward absorbing Holland and Belgium in the German Zollverein.

It is authoritatively announced in London that Mr. Gladstone's visit to Copenhagen had no political significance.

The London *Times*, in tracing the antecedents of O'Donnell, the assassin of Carey, shows that he is forty-five years of age and a native of County Donegal, Ireland. He served in the American war, and lived in Philadelphia and on the Canadian border. He lost his money in silver mines and Fenian bonds. Last May he returned to Ireland and consorted with Irish-Americans in Londonderry. He was considered a strong Nationalist, but was opposed to the Invincibles. When Carey turned informer he denounced him, and declared that he would burn him by inches. He went to the Cape to seek work because he considered America "played out." He had no idea that Carey was on board the *Kinfauns Castle* when he embarked upon her, and had never seen the informer. Mrs. Carey and other witnesses of the murder of James Carey arrived at Plymouth, Eng., on Monday. The question of O'Donnell's defence has been referred to the U. S. Legation in London, which has consulted with the British Home Secretary in regard to the matter. The hearing of O'Donnell's case was begun in London on Tuesday.

Irish National League meetings were prohibited in the counties of Clare and Limerick on Sunday. An attempt was made to hold one of the advertised meetings, but the police interfered.

Sir Edward Sullivan has taken the oath of office as Lord Chancellor of Ireland, succeeding Mr. Hugh Law, who died recently.

A meeting of the joint committee of the cotton spinners, manufacturers, and operatives of north and northeast Lancashire met at Manchester, England, on Tuesday to confer upon the depressed condition of the cotton trade. The principal object of the conference was to arrange a scale of wages. The market for cotton goods is admitted to be suffering from overproduction. It was agreed that the operatives should resume work pending further negotiations.

The rocket factories connected with the Woolwich, England, Arsenal exploded on Monday, causing serious damage to a number of buildings and the loss of two lives.

It is reported that the British Government will again enter into negotiations with the Suez Canal Company relative to the proposed new canal.

It was reported from Rome on Monday that the negotiations between France and the Vatican had reached a satisfactory conclusion. The French Government has, it is said, restored the suppressed stipends to the Catholic clergy, and has given formal assurances of the most pacific intentions toward the Holy See.

The Vatican has authorized the Catholic Bishops who were expelled from Prussia to open negotiations with the Prussian Government for their return to their pastorates.

In a recent interview, Señor Castelar declared that he had always avoided opposing the patriotic desires of those who considered an alliance between the Bourbons and the Democracy of Spain possible. If the King resolved, during the coming crisis, on summoning the Dynastic Left and granting universal suffrage, and should the Constitution of 1869 be established, his course, he said, would be to merely continue the defence of the republic in Parliament and in the press. If, however, Señor Sagasta should continue in office, or a Conservative Cabinet be formed, he should consider that the moment had arrived for thinking of other means of action which at one time had appeared to be forever condemned. In this case, it would be necessary to establish harmony among the different factions of the Democracy.

The Egyptian Government is vigorously repressing the slave trade.

Advices from Professor Nordenskjöld say that his expedition started from Auleikisvik, Greenland, on September 4, and reached a distance of 360 kilometres inland, attaining a height of 7,000 feet above the level of the sea. This is the first time that human beings have penetrated so far into Greenland. The whole region is an ice desert, with no open water inland. Very valuable scientific data have been obtained.

Professor Nordenskjöld has also telegraphed the following to the Associated Press agent in London: "During my excursion on the inland ice Doctor Nathorst, with the steamer *Sofia*, in charge of Captain Nilsson, anchored on July 27 in a bay near Cape York, 76° 5′ north. The doctor was accompanied from Godhaven by an Eskimo interpreter named Hans Christian, who had met at Godhaven a party of fifteen Eskimos from Wolstenholm. They said that they had been informed by other natives that the commander of the American expedition, whose name they pronounced 'Kasleyh,' and another member of the party, which had arrived at a point north of Smith Sound, were dead, and that the rest of the expedition had returned on sledges to Littleton Island." The commander of the American expedition reported dead above is Lieutenant Greely.

A letter has been received in Stockholm, Sweden, from Lieutenant Hovgaard, commander of the *Dijmphna*, dated August 1, in which he says that if the vessel is not freed from the ice this year he intends to send home twelve men in September, and remain himself with the rest of the expedition another winter; but if the *Dijmphna* is freed from the ice he will complete a chart of the Kara Sea. In that case he hopes to reach Norway in October.

Antoine Ferdinand Joseph Plateau, the Belgian scientist, died on Wednesday at the age of eighty-two. His works are mainly on light, optics, and vision.

A terrible battle was fought before Miragoane, Hayti, during the week ending September 8, the Government troops sustaining a serious defeat. Jeremie is surrounded by a force of 3,000 men.

The crisis in Bulgaria was on Wednesday reported overcome for the present, a compromise having been effected whereby the Russian Minister continued in office, but refrained from interference with the internal politics of the country. On Thursday the resignation of the Cabinet was, however, announced. M. Zankoff has formed a new Liberal Ministry. Prince Alexander's position is declared to be unimpeachable. He has announced the restoration of the Tirnova Constitution.

A MACHINE JUBILEE.

THE Machine leaders had a delightful time at Richfield Springs on Wednesday week. We doubt if they were ever in a convention of any sort which gave them more genuine enjoyment. They had full control, and were able to enhance the pleasures of possession by generous displays of magnanimity, which were all the more gratifying to the givers because they cost nothing. The representatives of the Half-Breeds who caused such disaster last year by declining to vote the party ticket, were received with great effusion and given front seats. The temporary chairmanship was bestowed upon Senator Lapham, and the permanent chairmanship upon Senator Miller. Both men were rapturously applauded by the Machine delegates, and their laudable sentiments in favor of harmony and a more generous party policy were received with uproarious delight. The old ticket, which was nominated by a convention controlled by Half-Breeds in 1881, was renominated with a single change and without opposition, and a contesting Stalwart delegation was persuaded to withdraw before the Convention met, in order that the harmony might be perfect. While the few Half-Breeds present were basking in the innocent enjoyment of this reunion, the Machine managers were quietly at work strengthening their hold upon the party organization.

The thoroughness with which they did their work commands a certain admiration. They secured for themselves every substantial party advantage which it was possible to gain by the Convention, and they gave the Half-Breeds everything which was of no permanent value to anybody. The Half-Breeds had the speeches, which few persons will ever read, and they were given the ticket, whatever that may be worth. The Machine leaders have as their share an overwhelming majority in the State Committee, and absolute control of the organization in New York city. As there will be no State Convention next year, there can be no change in the State Committee till after the Presidential election. The additions made by the new apportionment give the Committee more power than ever, and it is the hope of the Stalwarts that this power will be sufficient to enable them to control the delegation to the next National Convention. At present they are not disposed to use that power in the interest of President Arthur's candidacy unless he is more "friendly" than he has been recently.

In regard to this city, the action of the Convention is precisely what the Machine wished it to be. The platform approves the plan of reorganization, and hopes "it will be persisted in, to the end that it shall embrace all Republicans in the city on equal terms and feeling." This generous but slightly vague expression of good wishes was subsequently supplemented by a resolution directing the Central Committee to carry out the plan of reorganization proposed by the Committee of Eighteen, "with such amendments as may be deemed advisable by said Committee." In other words, the city Machine is directed to reform and reorganize itself, so far as, in its own opinion, such regeneration is "deemed advisable." Judging from the observations of the friends of the Machine, that point has already been reached, for the *Tribune*, which has zealously defended the sincerity of Chairman O'Brien and his Stalwart associates, announced a day or two ago that "reorganization has been successfully accomplished."

Having secured all they desired for the present, the Machine managers closed their jubilee with a captivating promise of reform in the remote future. They allowed the delegates to express a belief that the party conventions should be "enlarged and liberalized," and to direct the State Committee to consider the question of the "reorganization of the party on a broader basis," and submit a plan to the next State Convention—in 1885. The delight of the Stalwart statesmen over that stroke of diplomacy must be boundless. After practically depriving the masses of the Republican voters of all voice in the choice of the men who are to nominate a Presidential candidate next year, the Machine coolly remarks to the same voters: "You come and see us in 1885, and we will talk over that little matter of putting the party on a broader basis." We doubt if the authors of this cheap stratagem are so feeble-minded as to believe that they are deceiving anybody. The fact is, that they do not care for Independent help in their work of this year and next. They have little interest in their State ticket this year; and in the delicate work of packing the delegation to the National Convention, the less outside help they have the better. They have simply snatched the party organization for their own private uses, and unless the party asserts itself and forms a new and representative organization of its own, they will do about as they please with it. The performances at Richfield ought to be sufficient to convince everybody of the absurdity of thinking that any substantial reform can be secured by the action of the Machine leaders.

MARRIED WOMEN'S RIGHTS.

THE English Court of Appeal has recently decided a case between husband and wife under the new Married Woman's Property Act which is not without interest in this country, as the question involved might easily arise under some of the similar statutes adopted by our States. The husband was married to a lady who had, as part of her separate estate, a house. In this for a time they lived together, but troubles arose which led him to take the somewhat unusual course of leaving his wife and setting up a separate establishment. With this possibly the wife might have been well enough satisfied; but what she did not relish was the annoying practice he soon began of coming back for little visits, after every one of which some new article of personal property was missed. The house was comprised in the marriage settlement, and the wife now took the ground that in the present state of the law her husband had no right to enter it unless she chose, and that she might direct her servants to say "Not at home" to him whenever he called. Knowing, however, that he would not himself take this view of the subject, she determined to apply to the courts for an order restraining him from calling.

The learned justice before whom the application came granted it, and his decision has now been confirmed by the Court of Appeal. It was urged on behalf of the husband that the effect of such an order would be to grant a judicial separation, which could only be done by the Divorce Court; but to this the learned judge replied that if the husband wished his wife to live with him, all he had to do was to provide another home for her, and, if she refused to live in it, then to sue for a restitution of conjugal rights—a remedy which would no doubt be complete.

In the Court of Appeal the judges were at first rather staggered at the notion of enjoining a husband from visiting his wife; and the Master of the Rolls warned his brethren that their decision might have the effect of "altering the whole social life of England." But as they found, on looking into the matter, that there was no help for it, they granted the order, scrupulously guarding themselves, however, against any misinterpretation of their decision by refusing to say what the general principle governing this class of cases is, or whether a wife has under all circumstances a right to turn her husband out of her house.

The number of cases in which a wife who has an independent domicile will desire to exclude her husband from it without getting a divorce, is not likely to be very great, and therefore the warning of the Master of the Rolls seems more solemn than it need have been. Still, can it be said that there is a necessary connection between the right of a married woman to the separate use of her own property and the exclusion of her husband from it? The object of all laws for the security of married women's property is that their husbands shall not make away with it. They simply make general and thorough the protection which used to be imperfectly secured by means of private trusts. But no one ever dreamt of those laws being used for the purpose of excluding either husband or wife from the joint enjoyment of the house which constitutes the legal domicile of the family. It will be seen—and this was probably one cause of the hesitation of the judges—that if a wife may make such a use of the Married Woman's Property Act in England, the husband may protect his individual property from her in the same way, for he is at least fully as much master of this as she can be mistress of any separate property settled upon her. There would be something very ludicrous about a husband asking for an injunction to restrain his wife from coming to see him in his own house; and such cases would no more be likely to arise than are those rare suits in which a husband asks for a divorce on the ground of cruelty, or that his wife may be bound over to keep the peace against him. Still, they *may* arise, and they do undoubtedly bring up the question, which the judges in this case seem to have ingeniously dodged, how far, if at all, the very extensive property rights which in England and the United States have been given to married women, affect the old legal theories of the

relation of husband and wife. It is certainly not going very far to maintain that they cannot ever be treated by the law as total strangers to one another. The home of one must be the home of the other, unless we are prepared to take the view that marriage has ceased to constitute a status at all, and that a man, his wife, and their children are merely so many individuals who happen to be accidentally living under the same roof. But this theory of the married state has not yet made its appearance in any legal works of authority on the subject, and it is a theory which has so little support in the actual facts of the relation that it is never likely to gain great favor among either wives or husbands. If it did it would certainly alter social life in many remarkable and novel ways.

POPULAR MURDERS.

O'DONNELL's disgust with the lack of financial support which the Irish people are giving him for murdering Carey is not at all surprising. Nothing has done more to give him an exaggerated idea of both the nature and importance of his deed than the conduct of the British authorities and the tone of the English papers. We pointed out at the time of the shooting that the papers were playing into the hands of the violent portion of the Irish agitators by treating O'Donnell's act as a sign of the power and discipline of the Irish secret societies. Our theory at that time was that O'Donnell was not the agent of the Invincibles or any other organization, but had killed Carey from sudden impulse upon discovering who he was. The act was one which many an impulsive Irishman would have committed under similar circumstances, and, instead of showing the perfection of the Irish secret organizations, merely gave a fresh illustration of what everybody knew before, that all Irishmen hate informers as the worst enemies of their country.

The explanations which O'Donnell himself has given sustain this theory completely. He was represented at first as saying that he had killed Carey in self-defence, but when he reached London and found that no money had been raised by the people of Ireland for his defence, his impulsiveness again got the better of him, and he blurted out the truth by speaking of his deed as the "most popular murder since the shooting of Constable Talbot." That he should place this estimate upon it was not unnatural in view of the curious flurry which the English press and authorities have exhibited about it. They have taken the ground that the whole Irish people were behind him and were making a hero of him. Instead of allowing him to be brought to England quietly, every movement which was made with him was announced, and the precise date of his arrival in London was published. Then extraordinary precautions were taken to guard against attempts by his countrymen to capture him, and he was borne to prison with a police and military escort as intricate and formidable as that which surrounds the Czar of Russia in his progress through the streets of St. Petersburg. When he was safely housed the English public was informed of the fact, and the announcement was made that there had been plans by Irish secret societies for his deliverance, but they had been baffled by the vigilance of the authorities.

That O'Donnell's act was popular among Irish people everywhere is not to be questioned. They were so rejoiced at having Carey killed that they overlooked the fact that in killing him O'Donnell was just as guilty of murder as he would have been had he shot an innocent man. Where the English authorities have erred, in our opinion, is in mistaking this perfectly natural feeling as a fresh indication of the implacable hostility of all Irishmen to everything pertaining to English rule, and in persistently treating O'Donnell's act as that of an organized conspiracy. Nobody ever had any sympathy for Carey, and Irishmen were not the only people who were glad when he was shot. In such cases popular sentiment, tacitly at least, sustains the conduct of the slayer. We had an illustration of it in this country when Sergeant Mason attempted to shoot Guiteau. That act was a gross breach of military discipline, and if it had succeeded would have been murder; yet so strong was popular sentiment in support of it that a great outcry was raised against the punishment which was justly decreed to Mason, and he was for a time lifted almost into heroism.

That there was nothing more formidable than this unorganized sentiment behind O'Donnell is shown in no way more clearly than by the failure which he complains of to raise money for his defence. No action whatever has been taken for that end by any Irish society either in Ireland or elsewhere. In this country the *Irish World* started a voluntary subscription fund a few weeks ago, and this now amounts to $6,040. But this proceeds from no organization, secret or otherwise. It is noticeable that, in its efforts to stimulate subscriptions, the *Irish World* calls attention to the precautions which were taken to protect O'Donnell in London as evidence of the fear which the British Government has of him. If O'Donnell had been brought back to London secretly, tried and executed without excitement and as expeditiously as possible, there would be very much less chance of the Irish nation making a hero of him than there is now.

BISMARCK'S COALITION.

IT has now become almost certain—the press of all Europe takes this view—that the late journeyings and meetings of princes and diplomatists signified something more than summer recreation and exchange of courtesies, or soundings available for a future day; that they were intended to effect, and did effect, a widening and strengthening of the alliance entered into by Germany and Austria-Hungary in 1879, and expanded into a triple covenant by the accession of Italy last year. It is no longer doubted that Prince Bismarck and Count Kálnoky (who walks faithfully in the footsteps of Count Andrássy) have succeeded in converting King Milan, of Servia, into a pronounced ally, in spite of the Russian leanings of his people; in persuading King Charles, of Rumania, and his minister, Joan Bratiano, that it is dangerous for their Romance Kingdom to yield to Slavic advances, baited with the prospect of annexations at the expense of Hungary; and in inducing Alfonso of Spain to offer coöperation against France in return for protection against her threatening Republicanism. Thus Russia has been deserted by the two Danubian states which she raised by her war of 1877-'8 from the condition of tributary principalities into that of independent kingdoms, and she can find but scanty comfort in the sincere gratitude of little Montenegro, and the wavering allegiance of semi-independent Bulgaria; while France, abandoned by both her kindred neighbors south of the Alps and the Pyrenees, is now perfectly isolated.

The question arises, What are all these efforts of diplomacy for? What is the object of this coalition, sanctioned or unsanctioned by written agreements, of almost all Central and Southern Europe? Is a war of conquest meditated by the man of "blood and iron" against Russia or France? The new allies have nothing to gain by such a war, and the provocation of the Slavic Empire to a desperate struggle would almost surely bring about the ruin of Rumania and the downfall of Milan's throne, while an invasion of the French Republic would rouse all the revolutionary passions of Spain and Italy, and kindle a conflagration of incalculable extent. Besides, there is no reason to assume that the Court of Berlin meditates fresh conquest. All the traditions of the House of Hohenzollern militate against such an assumption. The sword of Prussia—a conquering sword indeed—has uniformly rested for a long time after each annexation it achieved. After rapidly swallowing her prey Prussia has always wisely allowed herself sufficient time for digestion and assimilation. It was only for defence that Frederick the Great fought the second Silesian and the Seven Years' War after grasping Silesia in 1740. His second annexation, that of a portion of Poland, took place after the lapse of thirty years. Other portions of the same country were taken by his successor more than twenty years later. The wars with revolutionary France and Napoleon, though beginning with aggression, were defensive in their character. The annexation of half of Saxony, which crowned them in 1815, was followed by forty years of abstinence, and it was owing to the recklessness of Napoleon III. that Prussia's grand acquisitions of 1866 were so speedily followed by a triumphant war with his own country. Germany will probably first assimilate Alsace-Lorraine, and complete her own unification, before she attempts new expansion eastward or westward—unless forced to act differently by events more or less unforeseen.

On the other hand, does France or Russia, or do both combined, menace the peace of Europe with imminent war? By no means. France has—partly, perhaps, from fear of her own dangerous *velléités de revanche*—plunged into African and Asian expeditions which render her completely harmless on the side of the Rhine or the Alps; and Russia is still too much distracted and paralyzed by her internal revolutionary sores to think seriously of carrying the banner of Panslavism across the

Austrian or Rumanian border in the immediate future. The military dream of the Skobeleffs, Tcherniayeffs, and Gurkos requires time and a French alliance, which is now impossible, for its realization. It is true, telegraphic news of the latest date speaks of extensive Russian military preparations along the Austrian and German frontiers; of tenders asked for 36,000 military beds; of steamers prepared on the Black Sea for the transportation of ammunition, troops, and provisions; of two army corps distributed between the Vistula and the Bug. But a great deal of this is undoubtedly mythical. So far from secretly intriguing at Paris for a hostile combination against Germany, the Russian Government betrays, through the voice of its most trusted organs in Moscow and St. Petersburg, a hostile feeling toward the French Republic, which can only be accounted for by a contemptuous abandonment of all hope of an alliance with her.

The most plausible explanation of Bismarck's activity in drawing so many satellites into the sphere of his original Austro-German combination is that he is taking precautions against perturbations of the Continental order not now imminent, but likely, if unprevented, to proceed from the inordinate desire of France for revenge, and from Russia's fanatical belief in her "manifest destiny" as the Slavic ruler of all Eastern Europe. The coalition is to be purely defensive, but so powerful as to render any attempt to assail any one of its members an act of madness. It aims to anticipate such attempts, to stifle schemes dangerous to the peace of Europe in their incipiency, and to give a different direction to the passion for military achievements agitating the French and the Russians. Let France extend her Algerian and Tunisian borders, establish a protectorate over Madagascar, seize all Anam, and fight China; let Russia suppress Khiva and Bokhara, subdue Herat, and seize Corea—the coalition will look on with complacency, for such an expansion in Africa or Asia will only secure peace and Austro-German predominance in the centre and the peninsulas of Europe. What the precise stipulations are on which this immense peace structure is to rest, or whether there are any literally binding stipulations, the journalistic world has not yet ascertained. That, supported by it, Bismarck can, at a propitious moment, diplomatically concert, or even decree, a general disarmament in Europe, and may possibly do it, is a very pleasant perspective. On the other hand, it is certain that the peaceful character and tendency of his great diplomatic work will not prevent him, if he sees fit to do so, from pouncing upon Russian Poland, wresting a part of it, adding it to Austrian Silesia or giving it to the King of Saxony in exchange for his kingdom, and thus conquering by the sword a new guarantee of peace.

AMERICAN HUMOR.

THE recent announcement that Mr. Howells and Mark Twain were going to bring out a book on "American humor" has drawn from the *Tribune* the following criticism:

"We are inclined to think that the queer article which is popularly supposed to be 'American humor' has been exalted overmuch. It is often anything but humor; sometimes it is broad farce—the caper of the clown; and not seldom it is a coarse trifling with things which ought to be sacred—a trifling which impels laughter only by its unexpectedness rather than by any other amusing quality. Of this kind of wit Mark Twain has proved himself a master; and the report that he is engaged in writing a book on 'American Humor' is not surprising. That Mr. W. D. Howells is to be his colaborer in this work is rather startling information. The harnessing together of the dromedary and the mettled courser is not always a safe or pleasant experiment for the Arabian. But if the accomplished author of 'A Modern Instance' will devote himself to carefully cutting out of the MS. all that peculiar kind of merry-making which Mr. Clemens has been used to put forth as characteristically 'American,' the public will be gainers by the conjunction."

The comparison of Mark Twain to a dromedary in this curiously "spiked" team is a little singular, for the dromedary is the last animal of the whole menagerie that would suggest to most people the capers of the clown or a tendency to trifle coarsely with things that ought to be sacred; but whether or no Mark Twain is open to the charge of imitating the dromedary in these practices, granting the animal to be addicted to them, the paragraph itself seems an example of that humor which impels laughter by its unexpectedness. Of the fact, however, that the peculiar kind of American humor which the writer has in mind has been overdone, we think there can be no doubt.

If we go back a hundred years to the pioneer period of American development, we reach a time when American humor did not exist, or, what is the same thing, was not recognized as existing. Mrs. Trollope found it as scarce as Artemus Ward did monarchy in Canada; and Captain Basil Hall's travels show clearly enough why its germs were unrecognized, even where these had already sprouted. The American people of that day were a serious people, and jested with grave faces, and everybody who has given much attention to the subject of humor knows that those who do this run the risk of not being understood. This undoubtedly partly accounts for the curious fact that Captain Hall, when informed by one of his Yankee hosts, in reply to a question as to the amount of thunder and lightning to be met with in New Hampshire or Vermont—that considering the population there was a good deal—should have put the answer down as an illustration of the stupidity of the inhabitants. Partly, also, it must be admitted that there was something very local and American about this particular joke—a joke such as Captain Hall would not have encountered in France, or Germany, or Italy, or England at that day, and one, therefore, which it is only natural that he should have been unprepared to appreciate. For there is a great deal in the proper preparation for a joke, the "prosperity" of humor having long ago been observed not to be at the command of the producer. Then, too, one reason why there was a long delay about recognizing the existence of American humor was, that humor itself did not occupy the important place in the moral economy of the world that it does now. If we go back to the time of Lamb, we find him for a considerable period in possession of the whole field. He perhaps did not recognize the fact that the modern world, with the eager, feverish rush of its life, its nervousness, its irritability, its sudden turns and surprises of fortune, would need more laughter than the steady old world which it succeeded; for he cared in reality very little about the modern world. But he was the first great modern humorist, and such was the condition of the market in his day that he had a monopoly of what thousands now reap a harvest from. The condition of humor as he found it, its limited extent and shop-worn quality, may be inferred from the fact that he seriously declared—and was, for all we know, right in declaring—that the best joke down to his time was the Joe Miller first set afloat, if we remember right, by Bacon or Sir Thomas More, consisting in the inquiry addressed to a boy carrying a hare: Is that your own hare or a wig? And there has been a great deal of serious discussion among English writers on wit and humor, from Lamb's time down to our own, whether this is not really the most valuable jest in the language.

When it was once discovered that there was any American humor, attempts were made to analyze and classify it, and to distinguish it from other kinds, especially the English; but as nobody has ever succeeded very well in analyzing humor itself, or distinguishing it from wit, it is not very surprising that the attempt met with no great success. Mr. Lowell, whose judgment about such a matter is worth a great deal, has frequently maintained that the essence of American humor consists in exaggeration; but he has himself concentrated more native humor into the 'Biglow Papers' than is to be found in any other book we have, and yet no one would say that the peculiarity of that variety of it was exaggeration.

But the "American humor" which now goes by the name, and has attracted such world-wide notoriety, is not, properly speaking, literary humor at all. It has about the same relation to literature that the negro minstrels or Harrigan and Hart have to the drama. It was begun by Artemus Ward, and has been perpetuated by a long line of jesters, funny men, clowns, or whatever they may be called, who stand in somewhat the same relation to the public that the jesters of the pre-literary period did to the private employers in whose retinue they served. They say funny things, or serious things, or idiotic things, but say them in public for the benefit of the vast audience which reads the newspapers. It is newspaper humor, rather than American humor, and though the fashion began in this country, it might easily be adopted, one would think, in England, where it is liked so much. Artemus Ward and Josh Billings, we should say, represent it in its earlier and purer state, and now it is represented by a dozen paragraphers, whose jokes make us laugh very often for the same reason that the sight of a man chasing his hat in a high wind will always amuse the bystanders—a fact for the true explanation of which we should have to plunge deep into the recesses of the human heart.

"THE IRISH QUESTION."

DUBLIN, September 8.

By your papers just to hand, Lord Coleridge is reported to have said to an interviewer in New York: "When I left England the Irish question and the Irish people were in the usual condition—nothing seems to affect them or bring matters any nearer to adjustment." When a great and learned and, I presume, fair-minded man like Lord Coleridge thus expresses himself, it is plain that even he does not know what the "Irish question" is. The mass of Englishmen, and Americans much more, may therefore be excused if they find themselves in a somewhat similar difficulty. England, serene in the belief that every country under her rule must necessarily be well governed and ought to be happy, but for the inherent "cussedness" of its inhabitants, worried and distracted by Irish clamor, rouses herself from time to time to find that everything is not all right in this melancholy and benighted island. She then honestly, though much against her natural inclination, sets herself to consider what it is all about; seizes upon some practical grievance, evolves out of her own consciousness a remedy therefor, and, when this is settled to her complete satisfaction, congratulates herself that all is then done that can be done—that in a few years at the furthest Ireland will be singing "Rule Britannia," and will, like Scotland, have settled down in happy contentment. Time after time, if not always, it has been so. Turning over some old volumes of an English newspaper, the other day, I lighted upon the period of O'Connell's death (May, 1847). A "poem" reflected the tone of the leading article. O'Connell, it appeared, while a man perhaps of some ability and sincerity, was a demagogue who, leading the people from the paths of peaceful progress, plunged them into an abyss of vicious agitation.

> "We all were equal in the law's calm eye,
> The last link of coercion's penal chain
> Was burst; and men spoke not of days gone by,
> But yearned to crown with joy fair Erin's plain.
>
> "Oh, better thousand fold it would have been
> For him, his country, and the empire wide,
> To crown with industry the island green,
> Flinging with scorn fierce politics aside—
>
> "Calling the vast resources of the land
> Forth from their fatal lethargy, and giving
> To Albion's sympathy the heart and hand,
> All mutual wrongs forgetting and forgiving."

This doggerel, read in the light of the history of the past thirty-six years in Ireland, is not without a certain grim humor. It expressed the feelings of liberal Englishmen of 1847, as it would have done those of every year since, and as doubtless it expresses the feelings of Lord Coleridge at present. "Yes, the past has been very bad, *peccavimus;* but *now* we have done our duty; *now* we are fully alive to the necessities of the situation; we are *now* all equal in the law's calm eye—the last link of coercion's penal chain is burst—let us proceed to crown with joy fair Erin's plain." Our friends are very much astonished that we do not proceed to the proposed festival. They are not a little shocked and disgusted when, in a few years more, their contentment and self-satisfaction regarding their handiwork in the "island green" are again disturbed. They are anon, if not ever, doing what they think should settle the question. They have continually occasion to bewail the tortuous and unreasonable Irish character which will not acknowledge that the question is settled, and which still breaks out into troublesome clamor.

Meanwhile England persistently ignores the reiterated and declared convictions of the acknowledged leaders of Irish public opinion. They have never deceived her in the matter. They have always (gladly at heart, if perhaps often ungraciously in demeanor) accepted each reform which England has passed or helped them to pass; but they have never deceived her as to what they believed was fundamentally necessary for the contentment, happiness, and prosperity of Ireland. If Englishmen persist in claiming for their reforms a finality which Irishmen have never accorded to them, they have surely no ground for accusing Irish statesmen and reformers of disingenuousness. The burthen of such Irish public opinion from William III.'s time to the present has been the same. Molyneux and Swift and Lucas, Flood and Grattan, O'Connell and Butt and Parnell have spoken with the same voice. In 1698 Molyneux writes: "We have heard great outcries, and deservedly, on breaking the Edict of Nantes, and other stipulations; how far the breaking of our Constitution, which has been of 500 years' standing, exceeds that, I leave the world to judge." In 1880 Mr. Parnell says: "I would not have taken off my coat and gone to this work if I had not known that we were laying the foundation in this movement for the regeneration of our legislative independence." There has never been any deception in this respect. Statesmen after statesmen, one school of reformers after another, upon both sides of the Irish Sea, have believed or persuaded themselves that the reforms they agitated and achieved would content us. But still the prominent leaders of Irish opinion have maintained that there can be no peace until in some way the longing for Irish autonomy is satisfied; that no minor reforms of any kind will suffice—that that equality of rights and privileges which the conscience of modern statesmanship will demand, and which cannot long be withheld from Ireland, will, instead of settling the matter, be but a stronger lever in the hands of Ireland to attain what she desires and claims as her right. And the sentiments of these leaders of Irish public opinion have further been in complete accord in this respect—that it is not *separation* they desire, but an arrangement which, while quenching the Irish thirst for nationality, would lead to a real and permanent union between the countries—in Grattan's words, "United *quoad* nature—distinct *quoad* legislation." It is fair to argue that effectively ministering to the spirit of Irish nationality would tend toward separation. Count Cavour believed this, and so does the school of the London *Spectator*. I do not think it would. But it is unfair to say that men like O'Connell, Butt, and Parnell, who worked and are working for an autonomy which they believe would lead to real union (such a union as exists between your States), are working for separation (such as the Confederates fought for). Persistently and in the face of repeated denial to attribute this motive confuses the real issue. I do not blame the present exponents of Irish public opinion—men like Mr. Parnell and Mr. Davitt, whose views on the subject are well known to all who are intimate with them—if they have latterly given up all public definition of what they mean by Irish nationality. Mr. Parnell's early protestations were not believed. The protestations of their predecessors were never believed—until they were dead. If Parnell was struck off the bench of magistrates, Grattan was struck off the Privy Council. Men owe something to their own self-respect and pride. The support accorded to Emmet, and Smith O'Brien, and John Mitchel, and the Fenians, and the love with which their memory is cherished, is no argument to the contrary. The condition of affairs here has been so intolerable that men have welcomed any change, and will continue to venerate any men who disinterestedly have sought to effect a change.

With the exception of a short interval under Cromwell, Ireland had a separate Parliament, such as it was, from the day the Anglo-Normans established their power here until the year 1800. The right had seldom been more infringed and outraged than in the early part of the last century. Grattan accomplished the task for which his predecessors had striven. Irish independence was solemnly ratified by Great Britain. Its ruin was accomplished by the same statesmanship that sought to ruin your country. The arrangement between Great Britain and Ireland in 1780 would indeed have required modification, but the "Union" was an infamous transaction which will ever be regarded with shame by the Irish people, and against which the mass of them have never ceased to protest. That is the Irish question. "Nothing seems to affect them, or bring matters any nearer to adjustment," says Lord Coleridge. So it would be if you knocked down a man and deprived him of his liberty and fortune: the sixpences you doled out to him would never seem to affect him or bring matters any nearer to adjustment. So it would now be said regarding the South, if after the war the North, attempting to legislate for her paternally, had destroyed her legislatures and ruled autocratically by Northern politicians selected so as to be of different religion and feelings from the States they governed. Nothing you could do would seem to affect them or bring matters any nearer to adjustment. You would be in constant difficulty. You would be eternally worried, striving to find out what they wanted, and to manage for them. And the more you did for them the less they would be grateful or contented. In the history of the world there have perhaps been no more signal instances of "how to do" and "how not to do" than in your management of the Southern question and the British management of the Irish question. It affords a striking comment upon the flattery we Europeans are prone to lay to ourselves—that our trained and aristocratic statesmanship, drawn from the empyrean of long lineage, wide culture, and absence from sordid care, is more likely to be wise and effective in the management of men than the rough-and-tumble evolution of an "half-educated democracy."

Mankind will always be agitated by fresh needs, and "questions," and "causes." There will always be contending parties and interests. But it is impossible to believe that the dislocation and unrest existent in Ireland can permanently continue. Liberty cannot be permanently withheld from a people open to all the influences derived from the closest contact with the two freest and most reasonable nations in the world. The Irish question, then, is this: Will independence and contentment come through complete absorption in "England" or the "United Kingdom," as independence and contentment have come to Normandy and Provence through absorption into "France"; or must they come through becoming an autonomic "Ireland," a portion of the British Empire? That they can come only in the latter way, if they are not eventually to come through separation, is the conviction of Irish Nationalists.

This Irish question is too serious to be made light of, or to seek to conceal the difficulties attendant on its settlement. These difficulties have never been more clearly or more fairly put than by Professor Bryce, M. P., in the *Century* for last June. It cannot be too clearly borne in mind that fully one-fourth of the inhabitants of Ireland—the best educated and the most wealthy—are in favor of a continuance of the present arrangement. It was they who a century ago supported Grattan and manned the Volunteers. If they were brought round to con-

done and approve the act of Union, may not the other three-fourths come round in another century? But in weighing their possible attitude in the future it is well to bear in mind that they are attracted to England less by affection than by fear of their fellow-countrymen. A few years ago I met in a Swiss valley one of our fierce Irish Conservatives; and we spoke as men do abroad who at home only know each other by appearance. "Here at least we may speak the truth—no one can overhear us," he remarked; "don't you know very well we would be all Home Rulers but for fear of the Papists?" Will this fear of the "Papists" continue a permanent force? On the other hand, in so far as Ireland has any concentrated power outside her own limits it is on the side of the Nationalists. It *may* be necessary for the peace and happiness of the British Empire that a persistent effort should be made to crush out Irish aspirations. To us the task appears hopeless. Since the French Revolution it has not been possible permanently to crush national aspirations existent prior thereto. Great Britain underrates her power when she fears that with the army and navy in the hands of an Imperial Legislature in London anything a local Irish Parliament could do would lead to separation. Many Irishmen, it is true, now advocate separation. They have no rights which Englishmen are bound to respect. Were rights granted and aspirations respected, it would appear reasonable to expect that Ireland would soon respect and love a flag and power under which were guaranteed peace, security, and honor. D. B.

THE GOVERNMENT RAID ON THE HAMBURG DISTILLERS.

BERLIN, August 26.

A FEW days ago, on the 21st inst., the Reichstag was quite unexpectedly called to meet on the 29th inst. in extra session for the sole purpose of ratifying the new commercial treaty with Spain. Although this reason is not officially announced, there is no other public question to be settled, and it is expected that the Reichstag will transact its business in a few days.

Surprising as this announcement is, the previous history of the treaty and the hesitation about its transmission to the Reichstag are still more surprising. They form an interesting chapter of our political life, and are characteristic of the regard which is paid to the plainest paragraphs of the Constitution. The latter, in article 11, prescribes that all commercial, consular, and diplomatic treaties with foreign Powers, in order to become valid, must be submitted to and adopted by the Federal Council as well as by the Reichstag. Without their sanction such an act is only a draft which has no binding power whatever. What, now, did the Government do in the face of this clear provision?

The Reichstag had closed its session on June 12, and, after long and for some time fruitless negotiations, on July 12 a new treaty with Spain had finally been concluded. On the whole, it is favorable, and offers a great many advantages for different branches of trade. Besides, it is based on the principle of the most favored nation, and thus well adapted to further the commercial relations of both countries. Now our old treaty with Spain had expired on March 12, and it was the great desideratum of all parties concerned to have the new treaty carried into effect as soon as possible. The Government, however, allowed weeks to pass without doing anything. The official and officious press only engaged in a lively debate as to how the matter ought to be treated. The answer was very simple, and would have been given by convoking the Federal Council and the Reichstag and asking their sanction. Some of these papers, however, rather timidly objected to this mode of proceeding, as the coöperation of the Reichstag might lead to rather disagreeable consequences and imperil the whole treaty, while others were of the opinion that the Government might act independently of Parliamentary consent. The Liberal press unanimously protested against this violation of the Constitution, and argued that the Chancellor and his subordinates were pecuniarily responsible for any damage which might follow from their arbitrariness.

In the midst of these quarrels, viz., on August 9, the *Reichsanzeiger*, the official paper, published a note in which Herr Burchard, the Assistant Secretary of the Treasury, said that on the strength of an agreement with Spain, a part of the tariff would temporarily take effect until the whole treaty was ratified. Thereupon a new and lively controversy sprung up on the bearing and importance of this agreement as well as on its constitutional validity. The press organs of all parties, including even the Conservatives and the Ultramontanes, declared this expedient unconstitutional, and differed only in the tone with which they urged their views. The Government, however, did not deign to answer any question which was put to it in this regard, and the *Norddeutsche Allgemeine Zeitung* (Bismarck's organ) even went so far as to declare that the understanding with Spain was a mere administrative measure, and an expedient with which the Reichstag had nothing to do. This sort of pleading created general indignation. Last week Minister Boetticher, a gentleman of great tact and peaceful disposition, returned to Berlin. To appease the excited feelings he insisted on the convocation of the Reichstag, and carried his point without even an objection from Bismarck.

There is not the least doubt that the Federal Council will ratify the treaty within twenty-four hours. Even the representative of Hamburg, well drilled in his obedience to Bismarck, will not offer any resistance. The Reichstag, also, would probably consent without long debating if the treaty, unobjectionable in itself, had not an appendix which is likely to raise a great many objections and give vent to bitter feelings. In all parliamentary bodies, the majority, for two reasons, do not care much to discuss a treaty with foreign Powers—firstly, because they have to adopt it unconditionally, and therefore only in an extreme emergency interfere with the work of the diplomatists; and secondly, because they do not know much about foreign matters. So it has been and is also with us; but in the present instance a discussion on the legality of the Government's actions, and especially on the appendix with which the treaty is saddled, may be confidently looked for. This memorandum says in substance that, on the strength of a declaration of the Spanish Plenipotentiary, only such alcohol shall be treated as of German origin and taxed accordingly (viz.: 17.35 pesetas per hectolitre) as has been manufactured in Germany from German spirits; while if distilled from foreign (*i. e.*, Russian) raw material, it will have to pay 20 pesetas, or a duty of about 25 cents more per hectolitre. And to this shocking proposition the German negotiator nodded assent.

It is the city of Hamburg whose export of alcohol is aimed at by this exception from the rule. The old Hanse-town has for years had a large and profitable spirit trade with Spain. Not belonging to the Zollverein, it imported Russian spirits duty free, and having rectified them exported the alcohol to Spain, where it is used in the preparation of the native wine. Hamburg has five large establishments with a considerable capital and all the modern improvements. It is the largest buyer of spirits in Germany, and has built up a flourishing trade which grows from year to year. The larger the purchase of Russian spirits, however, became, the better customer was Hamburg for German spirits. Thus it imported in six years (1877-1882) 993,886 hectolitres of Russian spirits, valued at 38,563,890 marks, and 2,578,370 hectolitres of the same German article, valued at 111,476,650 marks. But our rectifiers, considering their interest jeopardized by the Hamburg competition, finally succeeded in gaining over the distillers, of whom a majority belong to the landed aristocracy, and, by driving Russian spirits from the German market, imagined that they could get entirely rid of it. There is every reason to presume that the Government met them half way. Not daring openly to betray the interest of the largest seaport of the Continent, it suggested the maltreatment of Hamburg to the Spanish negotiator, who was not in the least concerned at having one part of Germany worse dealt with than the other.

One thing is certain: if the agrarians carry their point, the Hamburg spirit export will be doomed, for it will no longer be able to compete with other manufacturers and countries. The difference in price of rectified spirits ranges between 40 and 55 marks for 100 litres. The profits are small, and turn between ¼ and ½ per cent., as the article is cash, and in general a very safe one. The excess of 2.65 pesetas (=2.25 marks) which Hamburg will have to pay more than the rest of Germany, if the treaty with its appendix goes into operation, is consequently between 4 per cent. and 6 per cent., and too great to allow a paying business. Hamburg, therefore, will not be able to maintain its former supremacy in this article; its shipping interest will also suffer enormously, and its standing in the world's marts be affected.

Russian spirits will of course not be driven from the international market. Spain needs them and pays the highest prices for them. New rectifying distilleries will be built in Sweden and Norway or Belgium, with the Governments of which countries Spain also has a treaty according to which the duty on alcohol does not amount to more than 17.65 pesetas. The German distillers will lose an excellent customer, and the smaller the number of rectifiers becomes, the greater will be the competition of the distillers and the cheaper will they have to sell their product. Thus Hamburg will lose, the Prussian rectifiers will not gain, and only our neighbors, who are more shrewd than we are, will profit by our suicidal policy. † † †

BERLIN, September 8.

THIS time the extraordinary session of the Reichstag was a really short one. All its business was despatched in four days, viz., from August 29 to September 1. The apprehensions that it would be loaded with other bills besides the Spanish treaty were fortunately not realized. Besides this one, only a treaty with the Powers bordering on the German Sea, for the protection of the fisheries there, was passed without debate, as it was well drawn and met a long-felt necessity. The Spanish treaty was not as thoroughly discussed and investigated in the House as it would have been in a special committee to which the Liberals proposed to refer it, but were outvoted. Thus the chief objections and doubts remained unanswered. It was, for instance, believed that the appendix to the treaty which excepts the Hamburg spirit export from the benefit of the conventional tariff had not been laid before the Senate of that free city, which in

its ignorance assented to the treaty with the appendix. In the committee all sorts of inquiry would have sifted the matter; in the public session of the House itself the member of the Bundesrath for Hamburg, as well as the Imperial Secretary of Foreign Affairs, refused to answer. In short, the most important parts of the treaty are kept secret, while enough is known to prove the inefficiency and incapacity of our negotiators. It is apparent that Germany granted almost everything and gained little. If Philip II., at the height of his power, had condescended to conclude such a treaty with the then poor Marquis of Brandenburg, the latter would have obtained fairer terms. There is one consolation: the treaty will last only three years. But why then make it?—I hear you object. The pity is that every international treaty is considered as an indivisible whole, which must stand or fall as such. It therefore rarely occurs that such a treaty is rejected, as the improvements on the old state of things and new advantages usually counterbalance its drawbacks and shortcomings.

The sharpest and fiercest debate sprung up about the question of indemnity, which, in the opening imperial message, was asked for by the ministers. Instead, however, of submitting a bill incorporating the main features of their demand, they left it to the Reichstag to draw one, which they promised to accept if it suited their views. Thereupon a minority refused to act in the premises, and left the consequences of the failure of an indemnity bill to the Government; the majority, however, finally succeeded in a compromise which suited the ministers and also met the approval of the Bundesrath. Thus the letter of the Constitution at least was upheld, and I hope the ministers will draw a lesson for the future from the proceedings.

The Cabinet cut a very poor figure in the debate. Bismarck being absent, his subordinates did not know what to do, and in the last hour whispered together to concert some common action. They even resorted to the shallowest subterfuges—kept silent when they ought to have defended themselves, and, harassed on all sides, pleaded for politer treatment. It would have been accorded them from the beginning if they had not tried to pick quarrels where there was not the least reason for them. These ministers do not command the respect of the Reichstag, for they are too weak and too dependent upon their master and maker; they do not dare to utter a single word without his authorization. The Bundesrath is of about the same metal. The Spanish treaty, with its appendix, was passed by these so-called representatives of the single States in fifteen minutes. They are whipped in by one of Bismarck's lieutenants. On the whole, they seem to be anxious to imitate the example set them by the old Frankfort Bundestag, which marched at the dictates of Austria.

It is often asked, What will befall the course of public affairs when Bismarck is gone? He has no trusted colleague, no disciple upon whose shoulders his mantle could fall. The Chancellor is so dictatorial and autocratic that he does not even suffer a discussion of his plans; his subordinates have to execute them blindly. He receives no check from the Emperor. The old gentleman is daily sinking more in health, and has lost his memory for almost everything except his army and its generals. When his counsellors report to him, he soon falls asleep or confounds everything. He is daily driven out, taken to theatres, interviews, parades, and watering-places—in short, the comedy is kept up with apparent seriousness. Thus Bismarck has the field to himself, and does as he pleases.

On the 4th instant an election to the Reichstag took place in Torgau-Liebenwerda (a district of the Prussian province of Saxony), which has a long history of its own, and for months was awaited with general interest. In the late short session of the Reichstag the Liberals also brought in an interpellation of the Prussian Minister of the Interior on this subject, and thereby created as much merriment as anger. Being sure that the case will interest your readers, I will state it in a few words, especially as it is characteristic of the so-called constitutional views of our ministers. The election of the Conservative representative of said district on February 13 had been declared null and void, on the ground of gross frauds and irregularities. The Constitution prescribes that in such a case a new election must be ordered forthwith (*sofort*). Instead of complying with the law, Minister von Puttkamer ordered a new election to take place on July 4, viz., nearly five months after the nullification of the first election, yet even so did not hold it at the appointed date, postponing it again to the 4th inst. Thus the district had been from October, 1881, to February, 1883, without a legally-elected deputy, and nearly seven months without any at all. Puttkamer, when first asked by a deputy how he understood the word *forthwith*, coolly answered that in his eyes it meant a reasonable time, not too far off; but in the Reichstag he had to account for the reasons which on June 19 had led him arbitrarily to postpone the election from July 4 to September 4. Now, hear his justification. The summer had been so dry, he said, that he expected an early rye harvest in the beginning of July, and therefore thought it in the interest of the farmers, who constitute the majority of the district, not to worry them with political duties. Minister von Boetticher, on the contrary, excused himself on the plea that on June 19 (or a fortnight before the date fixed) he had apprehended large inundations in that district, which would ruin the hay crop, and for this reason had acquiesced in his colleague's resolution. Which motive was the true one—hay and inundations, or rye and drought? Both are worth as much as the further excuse of Herr von Puttkamer, who pleaded the appeal of the inhabitants of the district for the postponement of the election, and, when more closely interrogated, could not name a single one. The postponement was of course only ordered in the interest of the Conservative party, which in July would have had to dispense with the greater part of the agricultural vote. Now the election has taken place, but the Liberal candidate has triumphed by nearly a two-thirds' majority, while his opponents are laughed at for their vain efforts. In the recent debates a member proposed to give both ministers occupation as weather clerks in the Observatory, as they could make rain and sunshine at the same time. † † †

Correspondence.

THE DEGREE OF PH.D. IN GERMANY.

To the Editor of The Nation:

Sir: Your readers ought not to be blinded to the real point at issue between the "Memorial" of the Philological Association and the "Answer" to that memorial by the Regents of the University of Michigan. The letter of your correspondent "W.," while it appears to deny, really admits the whole question. In reference to the degree of Ph.D., the language of the "Memorial" is the following:

"In order to obtain it, the candidate, if a native, must first have pursued successfully the studies of the gymnasium or real-school; must have been in residence at a university for three years; must present a thesis, which at many universities is printed; and must pass an examination. In Germany the degree of Doctor of Philosophy is as much a professional degree as that in theology, law, or medicine. When this degree was first transferred to this country, the conditions under which it was conferred were rigidly maintained here. . . . *But meanwhile the practice has been established of giving the degrees honoris causa*, and this practice has widely increased."

This language can have but one meaning—namely, that the degree of Ph.D. is *not* conferred in Germany *honoris causa* on native Germans. The "Answer" to the "Memorial," per contra, shows that that degree *is* so conferred; that it is given so frequently that Mommsen raised a great outcry about it; that, as Dreyfus-Brisac shows, it was so conferred on eighteen persons in one year, even by the University of Bonn; that the custom of so conferring it is so general that the distinguished Sanscrit scholar, Professor Roth, speaks of it as "zu einer blosen Ehrensache geworden"; that since the decree of Dec. 12, 1866, the degree of Ph.D., so far from being a professional degree, has not been necessary for admission to any position in Prussia whatever; and, finally, that the theory and the practice of the University of Michigan are in strict accordance with the methods that prevail in Germany.

These positions can hardly be overthrown by a mere discussion of the circumstances under which any particular degrees at Bonn or elsewhere *were given*. To talk about *why* they were given is a singular way of proving that they were *not* given. The question is not *why*, but *whether*. X.

Ann Arbor, Sept. 22, 1883.

THE CRITICS OF MR. C. F. ADAMS, JR.

To the Editor of The Nation:

Sir: A hot shot was thrown into the camp of the classicists in education when Mr. C. F. Adams, jr., delivered his Phi Beta Kappa oration at Harvard. The return fire has not been wanting in vigor, but among the big guns that have replied are some smooth-bores and blunderbusses, which have shot very wide of Mr. Adams's position. In spite of the pains which the speaker took to prevent misapprehension, many of his critics have failed to recognize the scope of the address, and have imputed to him views which he expressly disavowed. He did not come upon the platform to argue the case against the dead languages in the way in which it has so often been done; but being convinced that, as he expressed it, "not one man in ten thousand can contribute anything to this discussion in the way of more profound views or deeper insight," he came to tell what he had seen of the failure of the traditional education in modern life. In doing this he did not attempt to give the experience of a large number of men, nor of any in regard to whom his knowledge was incomplete or untrustworthy. Fault has been found with Mr. Adams for not considering in his address the recent Berlin University report. But why should he have done so? His task was the perfectly definite one of reporting the experience of those with whose history he was better acquainted than any one else. The critics might as well have taken to task the compiler of the Berlin report for not considering in it the experience of certain graduates of Harvard University. Moreover, the report was not written in Greek, neither in Latin, "in which learned tongues alone," says Mr. Adams, "I am theoretically at home." Unless he has added a knowledge of German to the defective outfit which his college gave him he is presumably unable to read the document, and the translation will not be published until several months later than the time appointed for him to speak.

Mr. Adams has been represented as ridiculing and underrating the classics, but nothing is further from the truth. In expressing his appreciation for real and thorough classical scholarship he goes to lengths to which many modernists would not follow him. To those who can study Greek and Latin with real interest he would give every opportunity, and would allow their acquisitions to pass current as a large part of a liberal education.

Further, he is told, with varying degrees of courtesy, that if he got little benefit from his college course it was because he shirked his work, and that he does not know anything about the effect of his study of the dead languages upon himself, anyway. Much that he has done, according to his own estimate in spite of the classics, he is assured was accomplished by their aid. This mode of refutation were better let alone. If a man of the clear insight and sound judgment of Mr. Adams fails utterly in estimating the effect of his own early training, pray how can we place any reliance on the statements of those who testify that the classics have been of great value to them? F. F.

NEW YORK, September 17.

THE VALUE OF TRANSLATING GREEK.

TO THE EDITOR OF THE NATION:

SIR: In your last number a correspondent submits some statistics of the medals given for English essays in the Albany City High School, averaging in favor of the classical as compared with the English and Latin-English courses. Probably a similar average of statistics would be obtained from most similarly arranged schools. But the benefit obtained in the study of Greek, which seems to be the defining feature of a classical course, is not in the possession of the language itself, but in the power over language gained in the work of translation. The amount of Greek given in the classical course is probably in addition to the same amount of Latin as in the Latin-English course; so that this lingering of the mind among modes of expression, which is the chief feature in the work of translation, is greatest of all in the classical course. But, however highly we may regard elegance of expression, or however valuable a ready apprehension of the force of language may be in itself or as a leader to new fields of thought, it is not all the value, nor the highest value, of an education. A knowledge of the future work in the world of these medallists would be quite as important to us as the statistics given.

On the other hand, to suppose that knowledge about a language will give power of expression in that language, is to mix things that have little in common. The history of Anglo-Saxon grammar and word-changes, the knowledge of rhetorical rules of writing and of criticism, or the critical and historical knowledge of English literature, are no more to be regarded as giving skill in the use of English than the study of a manual of gymnastics can be looked upon as making a trained gymnast. Skill is the result of practice—inherited possibly. The snatches from various authors gained in a year's study of English literature may give to an imitative mind an impulse that results in marked power of expression—certainly a close reading, year after year, of the best models is likely to do this; but the value of this study at school is to incite to these years of reading, and not to make a skilful writer. The Greek, as an original language leaning back upon no other—the first exponent of the world's broader thinking—may have something of the flavor of wild game as compared with tamer food, incorporating in itself more of the fresh fields of sun and breeze than is elsewhere found. But, whatever a language possesses in itself, its value to the student undoubtedly comes from that persistent manipulation of words which the work of translation imposes, and which, to any but the dullest mind, must eventually give power of expression. That a proper management of our own tongue could be made to serve the same purpose is undoubtedly true, but the mode of doing this has not yet been discovered. Yet the Greeks did not gain their power over language through the work of translation. The real value of this power over language is not so much that it makes ready writers as ready readers in all fields of thought. In the work of translation the thought is furnished ready to hand. Perhaps, if the time ever comes when power over the English language can be taught through the medium of the English, we shall have fewer books where elegance of expression takes the place of substantial thought. Clearness of thought is apt to give clearness of expression—terseness, if not elegance—and, possibly, in an age of original thinking, a people would not have to learn its own tongue through the medium of another.

The best statistics on the point in discussion would be with regard to the kind and intrinsic value of the books written in mature life by pupils who have been trained in these different courses of study. H. E. A.

CLEVELAND, Sept. 17, 1883.

IMPROVED METHODS OF TEACHING THE CLASSICS.

TO THE EDITOR OF THE NATION:

SIR: For several weeks past I have been reading with keen interest communications on the subject of ancient *versus* modern languages in education, commencing with your own able article on Mr. Chas. Francis Adams, jr.'s Phi Beta Kappa oration last June. As one of your correspondents alluded, in your issue of September 6, to my reply to Mr. Adams, in terms of approval, and as several writers here seem to have understood me to vindicate the study of Greek *mainly* as a means of understanding scientific terms formed from that language, I should be glad to be allowed an opportunity of stating that on many other occasions I had endeavored to show the great value of even a moderate knowledge of that language, when soundly and agreeably taught, in preparing the mind for the study of all languages and in sharpening and developing logical thought. A very large number of pupils educated by me during nearly thirty years will bear testimony to the fact that I am no bigoted upholder of classical education as adverse to English and scientific. On the contrary, I have always advocated sound common-sense instruction in our own language as the best and most proper basis of all education for English-speaking youth. But, as regards Greek, and Latin also, much of the dislike and dread with which they have been regarded has arisen from many schools and teachers still adhering to the dry, hard, and unattractive methods in which they were taught thirty or forty years ago. It is well known I am no advocate for empirical or superficial teaching; on the contrary, I agree with Mr. Adams that the great changes which have been wrought by discoveries and inventions, even in the last quarter of a century, demand corresponding changes and improvements in modes and means of education also—not, however, I venture to think, exactly in the line proposed by him. Business men, merchants, and professional men have had to conform to, and put themselves and their work in accord with, the energy and practical usefulness demanded by the new order of things. Teachers of every class must do the same, if they are to hold their proper place in public estimation.

The liberal support given in this country, both publicly and privately, to education ought to, and I presume does, secure an ample supply of really good teachers in every department. Taking this for granted, I maintain that, while a large and accurate knowledge of Greek and Latin cannot be gained without considerable time and labor, a smaller but very valuable knowledge can be given in schools, not only without neglecting English education and instruction in modern languages, but with great help and benefit to the study of these.

It is acknowledged by men better acquainted than I am with the school systems of the country that many subjects to which much time is now given might well be postponed, and others taught in a much simpler, pleasanter, and more effective way, as, for example, "English grammar," which is in many schools taught with great labor to pupils and teachers, and with very unsatisfactory results. The speaking and writing of good English should be taught in a much more natural and effective way, and could be if grammatical rules and analysis were deferred to a time when the mind was more matured for understanding them.

The educational experiments made in Germany, and alluded to by yourself, have shown the value of Greek and Latin training as fundamental and auxiliary to that of science; and certainly Latin forms the truest and soundest base for all the Romance languages—French, Italian, Spanish. This last is likely to be very soon the most important to young Americans, and one who has become a fair Latin scholar can acquire it with ease and pleasure in six months.—I am, sir, yours obediently, E. R. HUMPHREYS.

BOSTON, Sept. 23, 1883.

THE SUPPRESSION OF CRIMINAL LITERATURE.

TO THE EDITOR OF THE NATION:

SIR: The daily papers report that an agent of one of the prominent illustrated "police" newspapers published in New York has been sentenced by the authorities of the State of Georgia to several years in the chain-gang for dealing in obscene literature. This is excellent, if true, and, if it does not to some extent offset "Southern homicide," it cannot fail to check the general volume of crime. When "Baldy" Smith denounced a publisher of this poisonous stuff as furnishing to the young the best text book of crime in the land, he got a few faint cheers for his pains. It circulates with the utmost freedom in the Northwest at the present day, and, for aught I know, Georgia is the only State that has taken the matter up. F. G. C.

MINNEAPOLIS, MINN., Sept. 20, 1883.

MISSOURI SENTIMENT TOWARD THE JAMES BROTHERS.

TO THE EDITOR OF THE NATION:

SIR: In your issue of September 13 you say of Frank James that, "like his brother Jesse, he commanded the admiration and esteem of the community." Allow me, as a member of the community, to say a few words in its defence, and set forth some of the facts which go to show that your statement is unwarranted. The confessions of three members of the band of thieves led by the James brothers have recently been published, and each one gives the names of those persons from whom the gang had at times obtained aid and comfort—that is, the persons to whom they could make known their presence without fear of having that fact communicated

to the officers of the law. The total number of persons so implicated in the four counties in which these men remained while in Missouri did not exceed twenty-five, and many of these were connected either by blood or marriage with members of the band.

These confessions were made by different persons at different times, and the circumstances under which they were made were of such a nature as to bring forth the truth, and the whole truth. One was made by a convict who, in the last stages of consumption, had but a few months to live, and hoped by making a clean breast of it to spend those months with his family. The other two were made by men who knew that their immunity from punishment depended upon their telling everything they knew, and who made their confessions without having opportunities to confer together. These three confessions agree substantially, and in giving the names of their friends and abettors they had nothing to lose. Now, if in these four counties there were not more than twenty-five persons who would harbor and assist these cutthroats, does this not show conclusively that they were not held in esteem and admiration by the community?

That Frank James was acquitted is due to a defect inherent in the jury system, not to the lawlessness in the locality in which he was tried. He had five distinguished lawyers to defend him; the testimony against him was almost solely that of an accomplice; by his bearing and appearance he has the power to win men's sympathy; and an alibi was set up in his defence. With such a defence, and under such circumstances, it would be very difficult to convict a criminal anywhere. The Star-route conspirators were acquitted by a jury, but the people of the United States were none the less certain of their guilt. Hundreds of such cases might be cited, and will be recalled, by any one familiar with the great trials of the time.

Frank James, too, was acquitted in a county in which he was a total stranger, and in one which has never been accused of being in sympathy with outlawry; while in Jackson County, which was the hiding-place of the band, Ryan was sent to the penitentiary for twenty-five years by a jury of his countrymen. The community which is said to have held these men in high esteem has not shown them much mercy. Two have been killed, three have been sent over the road to the penitentiary, and two are held as witnesses, with indictments hanging over them, their only hope of pardon resting upon their telling all they know. These statements being true (and most of them can be established by record testimony), can these men be said to have commanded the admiration and esteem of the community? As a reader of the *Nation*, who has the highest respect not only for its opinions, but for its candor, I have written this in order to bring about some modification of a statement which does a great injustice to a rich and enlightened community.—Respectfully,

J. G. P.

INDEPENDENCE, Mo., Sept. 18, 1883.

[Our statement that Frank and Jesse James "commanded the admiration and esteem of the community," was not intended to be absolutely literal; and we cheerfully modify it. The reports of Frank's trial, especially when taken in connection with the fact that his brother never could be caught for purposes of trial at all, and that the gang lived for years as outlaws in great security, produced the impression that there was a great deal of sympathy for the "boys" throughout the State.—ED. NATION.]

ARMY HONOR.

TO THE EDITOR OF THE NATION:

SIR: A friend in Washington tells me that in a recent issue of your paper appears an article which, under caption of "Honor in the Army," is very severe upon *us all;* and three-quarters of us are west of the Mississippi, far away from the busy haunts of men who read and coin opinions from what the newspapers lay before their eyes. It would seem that because a few of us have issued false tokens in shape of duplicate pay-accounts, all of us are to be stigmatized as beings to whom honor has but the value Falstaff gives it. A reference to the records of the Bureau of Military Justice will show that officers of the army who have been charged with "conduct unbecoming an officer and a gentleman" (and of such conduct the definition is the same *in* the army as it is *out* of it) have been justly dealt with by courts-martial; and that if, after having been found guilty of such conduct, they are still among those against whom your article appears to have been launched, it is *not* the fault of the *army*, but owing purely to the way in which the civil portion of the military establishment—to wit, the President and the Secretary of War—has been approached and influenced by powerful political and social friends of those who have been sentenced to dismissal from a service their actions have cast dishonor upon. We have tried to do what all prudent men will always do—cut away the sore spots; but where we have failed, the *authorities* are to blame, and upon their heads should fall the discredit, not upon ours.

Some people may remember that, shortly after the advent of Mr. Hayes, he caused it to be announced to the army that crime would be punished, and that offenders need not look for mercy. The tone of the order setting this forth was such as to imply that all of us were more or less tainted with drunkenness, and that if we did not at once reform we might prepare to meet our just deserts. Well, officers were tried for drunkenness on duty, found guilty, sentenced to be dismissed; and in nearly every case was the sentence either commuted to a forfeiture of part pay, with suspension from the exercise of official functions for a short period, or else set aside without comment! A most flagrant case was that of an officer who was tried upon twenty-two specifications descriptive of a variety of fraud, deceit, and other villany; found guilty of all or a portion of every one of the twenty-two; very properly sentenced to be dismissed, but who is yet in the service, because Mr. Hayes, at the solicitation of a number of Senators and Representatives from the offender's native State, commuted the sentence to a forfeiture of half-pay for one year, with suspension from rank and command during the time—about the equivalent of a year's leave of absence, which many a well-behaved and hard-working officer fails to get, on the ground that *his* services cannot be spared.

Many other instances of this way of neutralizing the efforts of military men to get rid of bad associates might be set forth. Take the case of one who, while in command of a post, made improper advances toward the wife of a brother-officer (at the time absent on duty), and who, after having been repelled, made use of his position as commanding officer to blacken the lady's character. He was dismissed by sentence of a court-martial, yet Mr. Hayes commuted the sentence "to two years' suspension." There are men in the army to-day (not many) who, after having been ejected for infamous conduct, have been restored by acts of Congress and the President. One of the last official acts of the late Mr. Garfield was to remit a sentence of dismissal in the case of one of these men, whose old habits brought him before a court martial shortly after he had been restored to the army by Mr. Hayes. The last Congress, in spite of earnest opposition from the army, passed an act authorizing the President, in his discretion, to appoint one of these characters to the first vacancy of captain occurring in the infantry, and thereby to retard the promotion of a lieutenant of twenty years' faithful and blameless service. The bill had already passed one branch of Congress, and was awaiting action in the other, when it was correctly reported that the person to be benefited had been seen disgracefully drunk in the streets of the capital. Did this influence the vote on the bill when it came up? Not a bit of it. Its allies carried it through in the face of previous bad character, immoral conduct, and drunkenness; and if the party is not in the army to-day, it is because the discretion of the President is of finer texture than was that of his two defunct predecessors. And yet, should this person be appointed, the army (to judge from the papers) would be responsible for him.

OPEQUAN.

FORT RINGGOLD, TEXAS, Sept. 10, 1883.

[We publish this letter because it reinforces the article in question, in which we distinctly laid the blame at the door of the Executive.—ED. NATION.]

MR. JARVES AND MR. STILLMAN.

TO THE EDITOR OF THE NATION:

SIR: In your issue of the 20th instant, I notice that Mr. Stillman reiterates his attack on me in regard to the electrotype bust. I repeat my statement of August 16, and those who care for the subject can decide with whom the weight of probability lies. Mr. S.'s facility of misapprehension is so vast that I despair of correcting his mistakes. I honor his regard for the soundness of art-criticism, but fear, in his alarm lest the public give me more credit than is due, that his own conscience pricks him for an unmerited reputation in this respect. Naturally this makes him, for the public good, solicitous to expose the "worthlessness" of my opinions in art. That he may associate with dealers in bric à-brac in Florence who, for reasons of their own agreeable to Mr. S., say untrue things of me, I cannot deny. But the "roba di Jarves"—*i. e.*, two terracottas and a "poor brown-stone statue" (*not* "bought," as he states, "from some villa garden")—I maintain are interesting, original works, as described in 'Italian Rambles' and the 'Descriptive Catalogue' of the Boston Foreign Exhibition; and I abide by my statements, leaving them to be confirmed or otherwise by unprejudiced experts.

Mr. S. errs in saying I purchased "grossly counterfeit bronzes," etc. Once I showed him a gilt bronze of an antique pattern which had been left with me, somewhat skilfully executed, and asked his opinion. He, as I, believed it to be an imitation, and advised getting Marquis Strozzi's opinion, for, if genuine, it would be of great value. The Marquis confirmed our judgment. If I could have foreseen the sort of use Mr. S. would make of personal confidences of this nature, and his defamation of me simply because the critic of the *Nation* said a few words of praise of my last unpretending little book, I should have been far more afraid of him than of being taken in by any counterfeit, gross or fine.

If I am "utterly incapable of forming a valid opinion on any work of art," will Mr. S. explain why the oldest academy of fine arts in Europe, that of Florence, unsought and unexpected on

my part, elected me long ago an honorary member on account of my writings and services in this field? Will he also inform the *Nation* how many other Americans have had this honor? I do not like to follow his example in citing the opinions of others against him, as he does "all Florence" (I suppose he means his *all*) against me, but I cannot refrain from telling him that I have more than once heard Englishmen of high position cite his letters to the London *Times* as most untrustworthy and mischievous: which fact possibly has something to do with their stoppage. After pelting me with the mud of gossip of the streets of Florence, it is very generous to say: "I have no personal quarrel with Mr. Jarves, and will accept none." What, then, is the motive of Mr. Stillman's wanton, and I call it malignant, assault? Heaven save me from my friends, if this is a sample of their good-will! I think the public now have had enough of this personal matter, and Mr. S. has done all the good to the art he "reverences" that he can reasonably expect, by advertising his scrupulous regard for it at my expense.

JAMES JACKSON JARVES.

HOTEL VENDÔME, BOSTON, Sept. 22, 1883.

[We cannot continue this controversy.—ED. NATION.]

PROF. JEVONS ON JOHN MILL.

TO THE EDITOR OF THE NATION:

SIR: About five years ago, the late Mr. Jevons performed what a distinguished colleague of his described as a "war-dance upon the prostrate form of Mr. Mill"; the dance consisting in a series of articles which far surpassed anything the present writer has seen in the field of reputable criticism in their sweeping violence, and in their unhesitating and unqualified—not to say arrogant and conceited—assertion of Mill's incompetence for the discussion of the subjects upon which he wrote. Not the most offensive thing in the articles was the assertion that Mill's mind was "essentially illogical"; a proposition which even in this rapidly progressive age must still seem to many of the best minds almost a contradiction in terms. Mr. Jevons's articles, in the present writer's humble opinion, so utterly failed to establish his position that they were best answered by the almost silent reception they met with; but one who recalls the fact that his arguments, such as they were, rested almost exclusively upon certain inconsistencies which he had discovered, or fancied he had discovered, in Mill's writings, cannot forbear a feeling of satisfaction on finding the charge of inconsistency prominently brought forward against Mr. Jevons himself by a critic so evidently friendly as the reviewer of Mr. Jevons's essays in this week's *Nation*.

It is perhaps unnecessary to add that these lines are not intended as a personal attack upon one whose early death has been justly deplored as a loss in the ranks of earnest scientific workers, but to call attention to a point which ought certainly to diminish the force of Jevons's strictures upon Mill in the minds of those who have not themselves thoroughly examined their merits; and this, I confidently believe, is the only class of readers who regard those strictures as of much importance. It may not be amiss to mention here that those who reverence Mill—and who love justice—will find much gratification in the tribute paid to him by Professor Sidgwick in the opening pages of his recent valuable work on Political Economy.

Yours, very respectfully, X.

BALTIMORE, September 24, 1883.

THE STRAW AS A SIGN OF CONTRACT.

TO THE EDITOR OF THE NATION:

SIR: I have noticed with interest the discussion going on in your paper as to whether it is true or not that professional witnesses advertised their calling by straws stuck in their shoes, to indicate that they were ready to commit perjury if they could find such employment. It seems to me history sustains Mr. Axon in taking the affirmative of this question. I make the following quotation from 'Memories of Westminster Hall,' by Edward Foss, F.R.S.:

"The professional witnesses were most noticeable frequenters of the Hall in 'the good old times.' . . . These abominable traffickers in perjury were employed by attorneys to swear to any lie for which the support of false oaths was required. Not only did they ply their abominable trade, but, strange to say, they plied it notoriously—making no secret of their infamous business to persons initiated in the usages of the law courts. Daily these venal liars walked Westminster Hall on the look-out for employment; a straw stuck in one of his shoes being the ensign by which a member of the fraternity advertised his readiness, in spite of the terrors of the pillory, the whipping-post, the plantations, and the gallows, to swear by the hour together for a stated payment *per* oath. Throughout many years of the eighteenth century, a wicked attorney named Wreathcock—who, after undergoing sentence of death, was transported for life in 1736—kept a number of these scoundrels in full employment; and though his exposure and removal from the country broke up 'Wreathcock's Gang,' the man and his lying slaves were speedily replaced by another 'connexion' of perjurers" (vol. i., p. 83–4).

M. D. CHATTERTON.

MASON, MICHIGAN, Sept. 22, 1883.

Notes.

D. APPLETON & Co. are to become the publishers of *Latine*, the monthly magazine edited by Prof. E. S. Shumway. In their Parchment Series the 'Sonnets of John Milton,' edited by Mark Pattison, will be the next volume. The Parchment Shakspere will, it is thought, be completed during the autumn. They announce also for speedy publication the third volume of Bancroft's revised 'History of the United States,' and Cobbett's 'English Grammar,' edited by Alfred Ayres.

Taintor Brothers, Merrill & Co. will shortly publish 'Mexico and the Mexicans,' by Howard Conkling, grandson of a former Minister to Mexico under President Fillmore. The book will be illustrated, partly by the author himself.

Professor Hoppin's 'Homiletics' comes to us bearing a new imprint, that of Funk & Wagnalls.

Richardson's 'Primer of American Literature' (Boston: Houghton, Mifflin & Co.) merits its present success of a "twenty-first thousand." It presents a fair and, in spite of its brevity, a readable conspectus of its subject. Twelve portraits, mostly of living writers, including the younger poets and novelists, have been added to the present edition. The book seems to have entitled itself to much more illustration of this kind, especially for the older periods.

A less successful primer (apparently intended for civil-service examination crams) is Mr. Henry Grey's 'Bird's eye View of English Literature' (E. P. Dutton & Co.). Its arrangement is formal and almost tabular, each author being set down in the order of his death, with a curt characterization over against him, or simple mention of his principal works. Longfellow, who is taken in at the end as an adopted Englishman, has more space and words allowed him than any of his predecessors.

Longfellow's 'Courtship of Miles Standish' has just been added to the Riverside Literature Series, with a dramatic arrangement for use in school exhibitions and private theatricals. The omission of the descriptive portions (except as stage directions) makes some of the scenes very short; otherwise the poem seems actable.

Both the juvenile and the holiday publications put in an early appearance this year. Of the latter class the first may be considered 'Twenty Poems from Longfellow,' with fifty illustrations (one a portrait) from the hand of the poet's son, Mr. Ernest W. Longfellow. Undeniably, such a work possesses a peculiar interest from this association of father and son and of two kindred arts. "The Village Blacksmith," "The Day is Done," "The Bells of Lynn," the sonnets to Felton, Agassiz, and Sumner, are among the more familiar and endeared pieces selected by the painter. The majority, by inherited sympathy, have a maritime theme or imagery, and the accompanying designs show no little mastery of wave form and motion, and of the general sentiment of the sea. The landscapes are also for the most part to be praised: some are intentional reproductions of actual views in Cambridge, at Nahant, etc.—the father's haunts. Mr. E. W. Longfellow's moons would draw down the censure of *Nature's* scientific art-critic for their disproportionate size; and can he who knows and depicts so well the curve of breaking surf have blunted the tips of the leaves of the "spreading chestnut-tree"? The cuts are admirably engraved, and the book throughout is of fine workmanship.

Next spring, the third oldest academy in Massachusetts—the oldest away from the seaboard—namely, at Leicester, will celebrate its hundredth year. Among its first pupils in 1784 was Eli Whitney, the inventor of the cotton-gin; so that the South should feel an interest in the approaching occasion. There are many eminent names on the roll of instructors and students; among the latter, William L. Marcy, John Davis, David Henshaw, Benjamin F. Thomas, the Rev. Gardiner Spring, etc. The most noteworthy fact in the history of this institution is that from the commencement it has practised coeducation of the sexes. We gather these particulars from an interesting paper read in July, before the Worcester Society of Antiquity, by the Rev. Samuel May, who in turn drew upon a 'History of Leicester Academy,' by ex-Governor Emory Washburn, himself a graduate.

The October *Manhattan* shows a marked advance in its pictorial attractions, the series of views of the Hackensack Valley, and the series of portraits of the Irish Parliamentary leaders, having a special claim to mention. The literary contents are likewise above the recent average. They include what is formally a sonnet of Whittier's on 'The Story of Ida.'

Dr. Coan's September *Topics of the Time* (Putnams) touches "Questions of Belief," reproducing, among other articles, Miss Cobbe's "Agnostic Morality" and Leslie Stephen's "Suppression of Poisonous Opinions."

Two more volumes extend the new edition of Emerson (Houghton, Mifflin & Co.), namely, the 'Representative Men,' and the second series of the 'Essays.' Those who side with Mr. Adams in his unfriendliness to Greek will be pleased to meet again, in the lecture on "New England Reformers," a telling passage in the spirit of the Phi Beta Kappa address.

The *Sanitary Engineer* is hereafter to be published regularly in London, a fortnight later than the date of its issue here. So much of our sanitary science has come from England that this return in kind is somewhat surprising.

What promises to be a successful movement to regulate by convention the railway time of the country (and conformably the local time) has been initiated by Mr. W. F. Allen, Secretary

of the General Time Convention, who has, to show the dreadful confusion now existing, prepared a colored map of the standards by which our railroads are run. Another map, more to the purpose—for the evil is notorious and crying—shows the division proposed by means of four central standard meridians, viz., the 75th, 90th, 105th, and 120th, or practically those of Philadelphia, New Orleans, Denver, and Carson City. The traveller adds an hour to his reckoning, or subtracts it, as the case may be, on entering a section from one adjoining. The Canadian system of roads is embraced in this scheme, and is assigned to the 75th meridian, together with the Eastern and Middle States, and the Southern seaboard nearly to Georgia. The pamphlet may be had by those interested of the National Railway Publication Company, at 46 Bond Street.

The Signal Service has recently made a contribution to theoretical meteorology which will be heartily welcomed by all interested in the science. No. 12 of the Professional Papers of the Signal Service, the title of which is "Popular Essays on the Movements of the Atmosphere," contains a series of monographs by Prof. Wm. Ferrel, of the United States Coast and Geodetic Survey, which, at the instance and request of General Hazen, Professor Ferrel has collected from the various periodicals in which they first appeared, and compiled into a single volume. Of these monographs, No. iv., "On the Relation between the Barometric Gradient and the Velocity of Wind," is perhaps the most interesting, as the results and conclusions therein set forth are certainly of much practical importance, not only in the prediction of "weather" (the end and goal of most meteorologists), but also in the science of barometric hypsometry, to which Professor Ferrel has made other valuable contributions. The thanks of all interested in this subject are due to General Hazen for thus setting forth, in a most convenient and accessible form, the results of Professor Ferrel's researches, extending over many years. The term "popular" in the title of this paper is, however, to be taken in a very restricted sense. Professor Ferrel is too thoroughly a mathematician to write for the non-mathematical, and this collection of papers abounds in derivatives and integrals and other wild beasts of the mathematical menagerie to such an extent that it would be quite unsafe to predict for it a very extensive circulation. Its publication, however, is another example of the desire and efforts of the Signal Service to place the science of meteorology on a sure foundation.

The Signal Service Bureau reprints, too, Professor Ferrel's 'Motions of Fluids and Solids'—also purely mathematical, a few pages excepted; 'Meteorological and Physical Observations on the East Coast of British America,' by Orray Taft Sherman; and 'Charts and Tables showing the Geographical Distribution of Rainfall in the United States,' prepared by Lieut. H. H. C. Dunwoody. This last covers the period 1870–1880, and groups the tables of rainfall at the several Signal-Service stations.

We have already spoken of the map of Tonquin lately prepared for the *Journal* of the Berlin Geographical Society by Richard Kiepert. It has since been published separately by Dietrich Reimer, Berlin. Though not the most comprehensive of the many now before the public, it is very helpful for comparison.

Michael Bacunin's 'God and the State,' with the prefatory words of Carlo Cafiero and Élisée Reclus, has been translated and published by Benjamin R. Tucker (Boston).

Pope Leo XIII. recently addressed a letter to Cardinals de Luca, Pitra, and Hergenröther, the three "learned" members of the Sacred College, in which he dwelt on the importance of the study of history, especially in a country like Italy, much of whose glorious past was due to the popes. Naturally enough, the Italian clerical papers overflowed with admiration of the Pope's manifesto, but even the Liberal press was disposed to construe his remarks into a concession to modern enlightenment. However, exactly one week after the publication of the letter, a new instalment of the Index Expurgatorius appeared, including among the proscribed books two such purely historical works as Aubé's 'Histoire des persécutions de l'Église: La Polémique païenne à la fin du IIe siècle,' and its continuation, 'Les Chrétiens dans l'empire Romain, jusqu'au milieu du IIIe siècle.' The value of these works has been generally recognized, but M. Aubé has relegated many stories of pagan persecution and Christian martyrdom to the realm of legend; hence his place on the Index, notwithstanding the Pope's fondness for historical studies.

The first draft of the chapter in the 'Contrat Social' on civil religion has been reprinted from the MS. in the Public Library at Geneva by Ch. Borgeaud in his 'J.-J. Rousseau's Religious Philosophy.'

The last few years have been productive of a considerable number of works on Hebrew grammar. Among the most noteworthy are the twenty-second and twenty-third editions of Gesenius's 'Grammatik,' in great part remodelled by Kautzsch (1878 and 1881); the first part of Stade's 'Lehrbuch' (1879); and the first part of König's 'Historisch-kritisches Lehrgebäude' (1881). School-books have been issued by Nägelsbach (4th edition, 1880), Stier (1881), Seffer (7th edition, 1883), and H. L. Strack (3d edition, 1883). Strack's 'Hebräische Grammatik, mit Uebungsstücken, Literatur, und Vokabular,' which, as a substitute for J. H Petermann's manual, now forms the first volume of the 'Porta Linguarum Orientalium, sive Elementa Linguarum,' issued by Reuther (Carlsruhe and Leipzig), is a perfect model of correctness and compactness. Though written mainly for the instruction or self-instruction of learners who begin their course of Hebrew at the university, it will be found, on account of its fulness coupled with extreme brevity (it contains no syntax), an exceedingly convenient book of reference for the finer features of the grammatical structures, even by advanced Semitic scholars. Teachers cannot fail to recognize in it a most useful companion, but we would not recommend it without another guide to learners, to whom its conciseness, here and there bordering on obscurity, must unavoidably prove not a little perplexing. The Hebrew type used in it is very clear; the transliteration, wherever demanded, is most minutely precise; and we have in vain searched for a misprint uncorrected in the few lines of "Errata." Its bibliography, embracing dictionaries, concordances, grammars, treatises on special themes, etc., is a valuable addition. The other volumes of the 'Porta' comprise Petermann's grammars of the Chaldee, Samaritan, Arabic, and Armenian idioms, and Nestle's Syriac grammar. A Persian grammar, by Landauer, is forthcoming, and an Ethiopic is to follow.

The unfruitful letter E fills nearly all of Parts 77–83 of the new 'Brockhaus's Conversations-Lexikon' (New York: L. W. Schmidt). England, however, and Europe both fall within it, the former receiving attention to the extent of forty-one pages, with a map thrown in. The article Encyclopædia is valuable for its bibliographical information. Among the biographies, those of Emerson, the two Everetts, and Ericsson will interest American readers. The sketch of Emerson is not brief in comparison with the standard of this work, yet gives in a few words an intelligent judgment of a writer who still fills a larger space in foreign eyes as an essayist than as a poet.

'Brehm's Thierleben' (B. Westermann & Co.) continues its steady progress toward its hundredth part: Nos. 90–98 are before us, and introduce the Reptiles. Excellent are the cuts of the tortoise, and very effective the colored plates of the giant turtles. But indeed, with the snakes, lizards, and crocodiles also, both classes of illustrations are here at their very best.

—Mr. R. G. White's article on "Old New York and its Houses," in the October *Century*, will, we trust, be widely read by occupants of the high-stoop brown-stone boxes which have in the last forty or fifty years taken the place of the dwellings of our grandfathers. Mr. White laments the destruction or reconstruction of old New York, but gives reasons for thinking that we have reached the end of the period of bad taste, and that there is hope for the future. But if Mr. Schuyler, whose recent article on the subject we noticed, is to be credited, we are really only entering on a new variety of bad taste, which will, from the enormous amounts of money laid out in developing and establishing it, eclipse all former periods. It is certainly a curious thing that in Boston, which also has been entirely reconstructed within a very brief period, good taste has come out of the struggle for existence with vulgar and pretentious display so much better than with us—though of course the Bostonians will say that it is not in the least curious, but rather extremely natural, and just what we might have anticipated from what we know of the history of the two cities. Mr. W. H. Rideing, in an article on Thackeray, traces some of the localities which occur in his novels, and points out the fact that locality counts for much less in them than in Dickens. The London of Dickens can be reproduced from his descriptions; the London of Thackeray cannot. A great part of the power of the former comes from his use of the scene or landscape in affecting the emotions of the reader. Everybody will remember the suspense, excitement, and horror produced in his mind by the description which precedes the death of Sikes in 'Oliver Twist,' and the night scene which precedes the murder in 'Martin Chuzzlewit.' Thackeray may have regarded such literary aids as beneath him. He resorted to them rather more than some of his predecessors had done, notably Fielding, in whose novels there is almost no scenery or background. Bret Harte has, in this country, caught from Dickens the secret of the use of surroundings, and applied it to the wild, untamed nature of the West with a great deal of success. We are inclined to think that it will not die out altogether, though the passion for analysis at the present day has dealt it an apparently mortal blow; but in the novel of the future it will be used again, though probably not better than Dickens knew how to use it. Mr. Austin Dobson's paper on the "Pupils of Thomas Bewick" will be even more acceptable to art students than the paper on Bewick which it supplements. The information it contains cannot readily be had elsewhere, especially with such comparative illustrations of the work of Nesbit, Clennell, Harvey, Jackson, and the rest. The animal pictures here adduced show how much the pupils fell short of the master, not as engravers but as observers of animated nature. Harvey's work seems furthest removed from Bewick's, both in style of cutting and in definiteness of design, especially when it is a question of filling up the background.

—*Lippincott's* contains a protectionist article, published perhaps to show what the protectionists can do in the way of argument when they take the trouble to expose the wretched free-

traders. Mr. F. D. Y. Carpenter is the writer. He declares at the outset that "a great surprise is in store for the simple student of political affairs in the discovery that the free-traders of the United States are not free-traders at all." Mr. Carpenter has discovered, by means of correspondence and personal inquiry, that the persons who call themselves free-traders do not insist upon the abolition of the custom-houses and on revenue by direct taxation, and therefore he maintains that they are little better than hypocrites. The publication of this article throws a curious light on the condition of mind in the protectionist camp; for it is evidently put forward as an important contribution to the free-trade controversy. "In the Highlands of North Carolina," by Louise Coffin Jones, is a description of a little known, and to us, we confess, uninteresting country. "These our Actors" is the title of an article on the stage, by L. Clarke Davis, containing a good deal that is readable.

—"Daisy Miller," as a comedy in three acts (Boston: James R. Osgood & Co.), hardly does more than remind the reader of the clever little story of which it is a dramatization. Mr. James was obliged to change the climax (for to have the stage-version end in a death would hardly have done), and he has also thought it necessary to enlarge the European background and to introduce a new plot. With all these changes, the drama and the story are such distinct creations that it is idle to try and compare them. There is very little action in the play, but the dialogue is bright, and the sub-plot of *Eugenio* and *Giovanelli* and *Mme. Katkoff* is ingeniously worked out. *Randolph P. Miller*, the American boy, who is the product of hotel-life and affectionate parental neglect, presents a new and untried stage-type. The slight sketch of him in the story was admirable, and he is in the play quite unchanged in character, as the following extract will show:

"*Randolph.* Will you give me a lump of sugar?

"*Winterbourne.* Yes, you may take one; but I don't think sugar is good for little boys.

"*Randolph.* Oh, blazes! it's hard!

"*Winterbourne.* Take care, young man. You'll hurt your teeth.

"*Randolph.* I haven't got any teeth to hurt; they've all come out. I've only got seven teeth. Mother counted them last night, and one came out afterwards. She said she'd slap me if any more came out. I can't help it—it's this old Europe. It's the climate that makes 'em come out. In America they didn't come out; it's these hotels!

"*Winterbourne.* If you eat all that sugar, your mother will certainly slap you.

"*Randolph.* She's got to give me some candy, then. I can't get any candy here—any American candy. American candy's the best.

"*Winterbourne.* And are American boys the best little boys?

"*Randolph.* I don't know. I'm an American boy!

"*Winterbourne.* I see you are one of the best.

"*Randolph.* That isn't what my mother says, you can bet your life on that!"

But in an acting play, would it not be difficult to have *Randolph?* A bumptious, noisy hotel-child could be represented, of course, by one of those precocious stage infants with which our theatre is so thoroughly well supplied; but, then, would not the result be a little unpleasant—a little too like personal contact with *Randolph* in a hotel "corridor"? Fond as we are of the boy, and little as we should wish to spare him, we like him in a sketch better than in this high dramatic relief. With regard to *Daisy* herself, everything would depend upon the acting. We can imagine an actress who would make her charming, but we confess that we do not remember any leading lady now on the boards who would be likely to make her anything but vulgar.

—About the time when Mr. Henry Irving will produce in America Wills's tragedy "Charles I.," in which Cromwell figures as a sordid and vulgar clown, there will be acted at the Odéon Theatre in Paris the first published play of Victor Hugo, called "Cromwell," and famous more because of its preface than of its merits, as it is so hopelessly long that very few readers have ever had the courage to persevere in its perusal. Planned originally for the acting of Talma, and constructed with a view to the stage, Hugo seems to have abandoned the hope of seeing it performed before he began the actual writing, and to have therefore given his pen full license to run on without limit. Still, it has always been possible to see in it the well-knit skeleton of a possible play. It is this skeleton that is to be exhibited on the stage of the Odéon. Hugo himself has cut his verses with a merciless hand; and besides having had the pleasure of seeing the second performance of "Le Roi s'amuse" just fifty years after the first, he will now have the pleasure of seeing the first performance of "Cromwell" fifty-five years after its first publication. The Odéon expects to produce "Cromwell" in December, 1883, and it was in December, 1827, that its preface set forth the programme of the Romanticist revolt. It was in the same house that Hugo's first play was acted within two months after the publication of "Cromwell." This was "Amy Robsart," a dramatization of 'Kenilworth,' produced February 13, 1828, and damned out of hand. Although wholly Hugo's own work, he announced it as that of his brother-in-law, Paul Foucher, then a boy in his teens. "Amy Robsart" has never been printed, and it is believed that the only manuscript of it is now lost. It is to be hoped that "Cromwell" will be more fortunate than its predecessor. In its revised and reduced form it is to be called a comedy. The chief part will be taken by M. Lafontaine, formerly of the Comédie-Française, who acted, in the "Jeunesse de Louis XIV." of the two Dumas, the character of *Mazarin*, the hero of still another play of Hugo's, not yet either printed or performed.

—These remarks have been in part suggested by the perusal of a curious book recently published by M. Edmond Biré, 'Victor Hugo avant 1830' (Paris: Jules Gervais; New York: F. W. Christern). With the indefatigable patience of a literary detective and with a malicious humor, M. Biré devotes 500 pages to the revelation of the pettinesses of a great man. He has hunted up all Hugo's earlier and forgotten work, searched all contemporary records, collected and collated many of Hugo's personal and public letters, and succeeded in showing that Hugo is a romancer even when writing his prefaces or his autobiography. The poet's claim to a noble ancestry is exploded, and his humble but honorable origin set forth. M. Biré has gone through the files of the little paper founded by Hugo and his brother, the *Conservateur littéraire*, of which the Paris correspondent of the *Nation* has given an ample account, and which is now so rare that the three thin volumes bring 1,000 francs. We happen to know that Hugo himself has not a copy, and that when he wished to see it a year or two ago he was forced to borrow the copy which M. Nuitter had given to the growing dramatic and musical library of the Opéra. From this source M. Biré has dug out many curious facts. Hugo, for instance, declared that his 'Littérature et Philosophie mêlées' contained all his earlier critical writing reprinted *verbatim et literatim*, but M. Biré shows that many articles are omitted, that most are retouched, and that nearly all are antedated. Most curious of all is this: Hugo in his preface refers to the plot of a tragedy outlined when he was a schoolboy and reprinted with these other boyish writings; whereas it appears that this boyish plot is merely a critical analysis (reprinted from the fifth number of the *Conservateur littéraire*) of a tragedy actually acted in 1817 at the Théâtre-Français. In one respect at least M. Biré's investigations are of real service to the history of literature. Twenty years ago there appeared a biography of the poet, called 'Victor Hugo, raconté par un temoin de sa vie,' and evidently written by a member of Hugo's household and under his own eye. It was generally believed to be the work of Mme. Victor Hugo. But in the prospectus of the now complete *ne varietur* edition of Hugo's works the name of this book also appears, whence the inference is inevitable that if Mme. Hugo held the pen it was Victor Hugo who dictated, and that the book may be accepted as an actual autobiography. Now, it happens (and M. Biré takes pleasure in proving it by reiterated comparisons) that although the main facts of Hugo's career are set forth exactly enough, yet in matters of detail this biography is wholly untrustworthy.

—The *Academy* of September 1 contains "Two Biblical Suggestions" by Professor Sayce, one of which possesses a rather wide interest. He discovers the name of Joseph in the fragment of Manetho referring to the exodus of the Israelites from Egypt (quoted in Josephus, 'Against Apion,' i. 26). According to the Egyptian historian, the leader and lawgiver of the Hebrews was a priest of Heliopolis, called Osarsiph, whose name, derived from Osiris, the god of that city, was changed into Moses when he had gone over to the despised strangers. Now, Joseph was by marriage a member of a Heliopolitan priestly family, his wife being (according to Gen. xli. 50) Asenath, the daughter of Poti-pherah, a priest of that city (called by the Hebrews On, by the Egyptians An). "It is . . . plain that in the Egyptian legend the name of Joseph was regarded as a compound of *Saph* and *Jo* (*Yo*), the national name of the God of Israel, who corresponded to the Osiris of Egyptian belief. That it was also sometimes so regarded by the Israelites themselves seems clear from the spelling Jeho-seph in Ps. lxxxi. 5." Thus the legend incorporated by Manetho in his dynastic history has fused together, Professor Sayce thinks, two Israelitish heroes of different dates: the one who was the cause of the Hebrews' migration into Egypt, and whose name the Egyptians translated into Osarsiph, and the real leader in the Hebrew exodus from that country. This "suggestion," if not as obviously correct as its author believes it to be, is at least plausible enough. We can say the same of his other suggestion, which identifies the Helam of David's campaigns against the Syrians (2 Sam. x. 16, 17) with "Khalman, the name of Aleppo on the Assyrian monuments." But if anything in philologico-critical speculations is surpassingly extravagant, it is Terrien de La Couperie's statement, in the same number of the *Academy*, concerning "The Affinity of the Ten Stems of the Chinese Cycle with the [first ten] Akkadian Numerals"—the "striking" linguistic affinity, which only "a few remarks are necessary" to explain, between the following two sets of words:

Ka(p)	*Gi* (one)	*ket*	*'ash* (six)
œt	*min*	*kam*	*'imina*
binh	*esh*	*dan*	*ussa*
dim	*shimu*	*njam*	*ishimu*
ku (or *mu*)	*'a*	*kwi*	*gu.*

Our readers, we trust, will pardon us for not reproducing the "few remarks."

CURTIS'S BUCHANAN.—I.

Life of James Buchanan, Fifteenth President of the United States. By George Ticknor Curtis. Harper & Brothers. 2 vols., pp. 625, 707.

To understand the work which a biographer of Mr. Buchanan has before him, it is necessary to state the unfavorable judgment which historical critics have passed upon him; for his vindication, to be worth anything, must be addressed to this. It is, in substance, that being a citizen of a free State, with full knowledge of the blessings to the country of a free-labor system and of the curse of slavery, his personal and political ambition made him the subservient tool of the slave power; that in this subservience he sacrificed the rights and interests of the free community in which he lived, and those of the nation as a whole, to the demands of the most ultra-champions of slavery. This, it is alleged, went so far that he abandoned principles which he himself had declared most sacred, and advocated the opposite; that from supporting Jackson in the most sweeping denunciation of secession and nullification, he, for the sake of the Presidency, adopted those pernicious heresies, and was nominated because the disunionists of the South were well assured that he was at one with them in their asserted constitutional right to secede without opposition whenever they should think it necessary to slaveholding interests. It is further alleged that, being President, he connived at all the incipient stages of rebellion, accepting the belief of his Southern leaders that formal secession, if he should refuse during his term of office to oppose the national power to it, would result in a Northern panic of Union-saving which would nullify the effect of Mr. Lincoln's election, and give slavery the protection of explicit amendments to the Constitution in all the territory of the United States, North as well as South. When secession actually began, ominous signs of wrath instead of panic were seen in the Northern States; his nerve failed, and he disappointed the disunion leaders by denying the constitutional right of secession, though he justified them in *revolution* by a false statement of Northern aggressions, and encouraged them to go on by denying to the national Government, in his own hands or his successor's, the right to suppress the rebellion. He gave the rebellion, therefore, the undisturbed opportunity of three months' organization, when a Jacksonian proclamation from him in November, 1860, when the calls for secession conventions were issued, would probably have limited the insurrection to a single State, if it did not squelch the whole movement.

On this indictment the common judgment of the world has found him guilty. It is doubtful whether former Secessionists of the South are not as explicit as Northern men in declaring him the chief cause of all their woes, bitterly complaining that he lured them on till retreat was for them impossible, and when their only hope of success without bloodshed was in his recognition of their independence by acknowledging the disruption of the Union to be complete. That they thought him committed to this, and quarrelled with him when he partly disappointed them, seems indisputable. Their programme really required a message from the President in December, 1860, in which he should announce that, in consequence of the election of Mr. Lincoln upon the Republican platform, South Carolina had exercised her constitutional right to withdraw from the Union, and that it only remained for the North to make concessions which would bring her back with such other States as were rapidly following her example, or at once and for ever to acquiesce in the separation. To have followed this by withdrawal of all troops from the seceded States would have produced a condition of things in which the cotton States would have had an independence *de facto*, and in which armed collision could only have come by formal invasion from the one side or the other. In such a situation they believed that the Northern States would have yielded to every demand, and that after negotiation the Union would have been reconstructed upon the constitutional pro-slavery basis indicated above. They would have found themselves mistaken in this expectation, but that they had it is scarcely debatable; and it is reasonably certain that they regarded Mr. Buchanan as fully committed to their doctrine. His denial of their constitutional right to secede was, to them, a desertion by an ally, and their first great disappointment in their plans.

The task of the biographer is to examine the judgment his fellow-men have passed upon Mr. Buchanan, and review it in the light of the more complete evidence which he has at his command. This Mr. Curtis professes to have done, and finds that Buchanan has been misjudged; that he was wise, consistent, patriotic, courageous; that he did all that could have been done in the great crisis of 1860 to defend and preserve the national Government; and that no just criticism can be made upon his conduct or his statesmanship. To reach this conclusion, however, it was necessary that the author should have peculiar theories of history and of statesmanship. His standpoint he has given us in a long chapter entitled a "Summary of the Slavery Question," the gist of which is that down to 1854 all the complaints of the South were just and reasonable, and that "abolitionism" was responsible for whatever danger of disunion there was, since the South had given no occasion for the introduction of the slavery question into politics. He, however, disapproves the repeal of the Missouri Compromise by the Democratic legislation of 1854, and denies that the Dred Scott decision was, in any proper sense, the judgment of the Supreme Court of the United States upon the constitutional rights of slavery and freedom in the Territories. This is, in substance, what was known in 1860 as the "Silver-Gray" Whig position, and we do not find that Mr. Curtis has since accepted a more comprehensive view of the history of the country.

He also holds the opinion that, upon the attempted secession of States, there was nothing more to be lawfully done for the country than was done by Mr. Buchanan, and that the President was right in asserting that there was no constitutional means of "coercing" a rebellious State. He attempts to draw a nice distinction between enforcing the national sovereignty against a State and against the individuals composing the State, and claims that this was also a distinction acted upon by Mr. Buchanan. Common sense, in this case, is in accord with the broadest views of law, and repudiates the attempted distinction as one without a difference; but, good or bad, the biographer entirely fails to give us any evidence that President Buchanan made it. With such views, it is a foregone conclusion that Mr. Curtis should produce only an apology for Mr. Buchanan which can have very little weight with any one who is not already committed to the same set of opinions. In other words, "Hunker Whigs" and "Bourbon Democrats," so far as specimens of these classes still survive, are the only people who will find much satisfaction in either Mr. Curtis's defence of the ex-President or the interpretation of public history which he gives.

He tells us that the materials placed in his hands were enormous, as Mr. Buchanan was systematic in saving and arranging his private papers and correspondence. This only makes more noticeable the paucity of material which he extracts, and the great gaps which occur in very important places. For instance, the attitude of Buchanan toward the Oregon and Texas questions prior to the election of Mr. Polk is left almost wholly in the dark, though it bears directly upon the question of his good faith and sincerity in his conduct as Mr. Polk's Secretary of State. In like manner, his correspondence with politicians in this country during his residence in England as Minister from 1852 to 1856 may be said to be omitted; and the period was that most critical one when his party repudiated the Missouri and all other compromises, and made the organization of the Republican party a necessity by arrogantly adopting Calhoun's resolutions of 1847 as their platform, in which it was asserted that every pledge of territory to freedom, from the ordinance of 1787 downward, had been unconstitutional, and that to exclude slavery was confiscation of property. Mr. Curtis says that Buchanan did not approve that change of front. In saying so he contradicts Buchanan himself in his utterances during the campaign of 1856. If his correspondence shows any previous disapproval, it would have been well to insert parts of it, even at the cost of excluding some of the tittle-tattle about social experience in English court circles. If Buchanan disapproved that fatal political step of his party, why did he accept the nomination for the Presidency upon the platform that embodied the ruinous doctrine? Why did he afterward argue in favor of it as a thing right in itself? He was the very man who had declared the Missouri Compromise to be "almost as sacred as the Constitution itself"; how is it that his biographer leaves wholly unexplained and unillustrated from that great store of private papers this change of his course to the opposite point of the political compass?

Again, Buchanan had been a typical "Jackson man." He had professed all of Jackson's hatred for the Calhoun doctrines of nullification and secession. He knew how scornfully Jackson broke through the pretence that nullification could be "a peaceful and constitutional modification of law," not only from the public documents of the time, but from Jackson's own letter, which Mr. Curtis inserts (vol. i., p. 185). In the same letter Jackson taught him the value of a ringing appeal to the patriotism of the people by his celebrated proclamation. It was in the same letter, also, that Jackson said: "Thus die nullification and secession, but leave behind the remembrance of their authors and abettors, which holds them up to scorn and indignation, and will transmit them to posterity as *traitors* to the best of governments." At what time and under what circumstances did such radical change in Buchanan's opinions occur that when the doctrine of the right of secession had infected the whole Southern Democratic party, he made himself acceptable to them as their candidate in 1856 by repeated avowals that he stood squarely upon the Virginia and Kentucky resolutions of 1798, which were the shibboleth of the disunion party and their chosen formula for expressing their most ultra dogmas? Here, again, the correspondence in the biographer's hands might give us much fuller light than is vouchsafed us.

The completed change cannot be wholly concealed, and some of the steps of it are also visible even in the scanty material which we here find. It is noteworthy that the indications of these steps generally appear in the seasons preceding the nominations for the Presidency. Buchanan had been a Jackson man till "Old Hickory" retired to the Hermitage, and he maintained the same outward appearance in the earlier part of the administration of Van Buren.

In 1839,* when the succession to Mr. Van Buren agitated all Democratic statesmen, in a first-class "machine" speech in the Senate against restricting Federal officers from meddling in practical politics (how history repeats itself!), Mr. Buchanan adroitly seized the opportunity to "put himself right on the record" with the Southern leaders, in the following terms:

> "Now, sir, I shall say a few words concerning the Virginia and Kentucky resolutions of 1798, although the Senator from Virginia may consider it sacrilege in me to discuss this subject. I have at all times, ever since I read and understood these resolutions, held to the political doctrines which they inculcate; and I can assure the Senator I have studied them with care" (vol. i., p. 387).

This would indicate that the reading and study had probably been since the close of Jackson's Administration.

In 1844 the Texas and Oregon questions formed the staple of the political issues, and the absence in the biography of everything which would show Mr. Buchanan's treatment of the subject is very significant. His position on the Oregon question was one which has been most severely criticised. He had declared Mr. Webster's treaty (the Ashburton Treaty) to be a gross abandonment of the rights of the United States in regard to the northeastern boundary, and he had gone all lengths with the Western Congressmen in asserting the unquestionable right to Oregon up to 54° 40′ north latitude. Mr. Curtis says of him that no one of the leading Democratic statesmen was more conspicuous in bringing about Mr. Polk's election than he. The platform was the notorious "54° 40′ or fight." Mr. Buchanan was made Secretary of State, and one of his earliest acts was to renew the proposal to make 49° the line of our northern limit, at the very time the Administration was renewing, in the President's messages, the declaration of our incontestable right to the whole. An apology which makes no reference to this inconsistency is too significant in its silence. Mr. Buchanan had been a candidate for the nomination, and had put himself in line with the extremest Southern men. His name was withdrawn because most of the Northern States had instructed their delegates for Van Buren. The "two-thirds' rule" was adopted in the Democratic Convention notoriously to give the South an absolute control of the nomination, though it ostracised every Northern man who could not satisfy the disunionists that he was a safe man for them. Mr. Buchanan not only accepted this rule, but afterward made its repeal in the Baltimore Convention of 1860 the ground of his assertion that Douglas was not the nominee of a "national" convention, and an excuse for supporting Breckinridge. His position in 1844 made him the chosen instrument, as head of the Cabinet under Polk, to abandon the claim to Northern Oregon and to wrench from Mexico a vast territory intended to make room for many new slave States. The controversy directly affected Mr. Buchanan's character as a public man. The question was, Did he hold all his principles subject to the dictation of the disunionists of the South, and as his capital with which to buy a Presidential nomination? Mr. Curtis gives us no help in answering it. In the Senate, Hannegan, a leading Democrat of the West, bitterly denounced the conduct as "Punic faith."

In 1848 the "handwriting" was plainly to be seen "on the wall." Mr. Curtis tells us that Buchanan determined to retire to private life. The Whig Administration under Taylor and Fillmore succeeded. The discovery of gold in the newly-acquired Territory of California caused a rush of free immigrants to the Pacific Coast, and the slave-power was again exasperated, the Union was again in danger, because California framed a free constitution and asked to be admitted as a free State. Clay's compromise of 1850 followed, the price for the admission of California being the Fugitive Slave Law, which took from free citizens of Northern States the constitutional right of trial by jury when their liberty was immediately in peril on the claim of a Southern man that they were escaped slaves. Buchanan emerged from his retirement to write a letter to a public meeting (vol. ii., p. 11), in which he signified his full acquiescence in the new Southern claim. "I now solemnly declare," he said, "that two things are necessary to preserve the Union from danger: (1) agitation in the North on the subject of Southern slavery must be rebuked and put down by a strong and enlightened public opinion; (2) the Fugitive Slave Law must be enforced in its spirit." Mark that he does not see danger from agitation in the South for the extension of slavery. In the same letter he says: "Had the Wilmot proviso become a law, or had slavery been abolished in the District of Columbia, nothing short of a special interposition of Divine Providence could have prevented the secession of most, if not all, the slaveholding States." This latter statement is important as showing his opinion of the extent and determination of the disunion spirit ten years before the rebellion, and of the full intelligence on this subject which he must have had in 1860.

In 1851 Buchanan was already in the field as a candidate for the Presidential nomination in 1852. He began to be inquired of, touching his present views on the slavery question, when public sentiment was making many a politician in the North change his course. To one inquiring friend (vol. ii., p. 23) he answers that "Madison's report and Jefferson's *Kentucky resolutions* are the safest and surest guides to conduct a Democratic administration of the Federal Government. . . . The *Sovereignty of the States* and a devotion to their *reserved rights* can alone preserve and perpetuate our happy system of Government." To a letter from the "Central Southern Rights Association of Virginia" (significant name) he answered in almost identical terms. To several other inquiries of a similar official kind, he declares that "States' rights" and the "reserved rights of the States" should be the issue to be presented by the Democratic party in 1852. Mr. Buchanan was defeated for the nomination by the rivalry of leading Northern Democrats, and Franklin Pierce was nominated and elected. Buchanan then accepted the mission to England on condition that he should not be required to remain abroad more than two years—a proviso which was equivalent to an announcement that he meant to be in the field in 1856.

In one of his prefatory chapters Mr. Curtis says that the earlier Democrats of the Middle States had "a strong tendency to the Virginia principles of State rights; but what these were, beyond a general tendency to watch and prevent an undue expansion of the Federal powers, it would be difficult now to say." Few readers of history will share Mr. Curtis's difficulty; but if any had before existed, in 1852 there was none. The Kentucky resolutions of 1798 had become the favorite form of expression among all the Southern extremists, because their phraseology was the most explicit and clear as to the alleged constitutional right of secession. No one knew this better than Buchanan, and he who boasted in 1839, as we have seen, that he had "studied them with care" knew full well how he would be understood by Southern States'-rights associations when he made the resolutions of '98 his platform. The names of Jefferson and Madison were often used to lure private Democrats in the North to ignorant committal to the doctrine of those resolutions; but not so their leaders. The significant part of the doctrine of States' rights which became the soul of the rebellion was found, not in the declaration that the Constitution gave only specified powers to the Federal Government, but in the sweeping assertion that the several States themselves, in case of alleged violation of such powers, were the "judges, *not only of the infraction, but of the mode and measure of redress.*" No subtilty of sophism has ever been able to rid these words of the whole sweeping doctrine of the disunionists, that, they themselves being the judges of cause, necessity, and policy of secession, the States had each and all the constitutional right to leave the Union when they pleased, and that, once having acted, they were as independent of the Union as if they had never joined it. Mr. Buchanan, as the "careful student" of these resolutions, knew perfectly well that they were so interpreted not only by Southern States'-rights associations, but by all the leading Southern Democrats in 1852. The common judgment of the world is that he accepted them in this sense, and was nominated in 1856 because Davis, Toombs, Mason, Slidell, and the rest of the leading politicians of the South had faith in his sincerity. There is small risk in saying that if his voluminous correspondence with Southern politicians passed unexpurgated into Mr. Curtis's hands, it would not be difficult to find sufficient evidence of this, scanty as are the specimens to which we are treated in this biography.

* By a slip of the pen, Mr. Curtis makes this "Toward the close of General Jackson's Administration" (vol. i., p. 378). A few similar errors have a rather confusing effect on the reader, such as putting the Chicago Convention which nominated Mr. Lincoln "in the spring of 1856" (vol. ii., p. 284).

RECENT WORKS ON ART.

Lectures on Painting, delivered to the Students of the Royal Academy. By Edward Armitage, R.A. London: Trübner & Co. 1883.

Luca Della Robbia, with Other Italian Sculptors. By Leader Scott. [Great Artists Series.] Scribner & Welford. 1883.

Art Work in Gold and Silver: Modern. By Henry B. Wheatley, F.S.A., and Philip H. Delamotte. Charles Scribner's Sons. 1882.

Art Work in Porcelain. By the same. [Handbooks of Practical Art.] Charles Scribner's Sons. 1883.

Human Proportion in Art and Anthropometry: A Lecture delivered at the National Museum, Washington, D.C. By Robert Fletcher. Cambridge: Moses King. 1883.

MR. ARMITAGE'S twelve lectures, delivered to the students of the Royal Academy between the years 1876 and 1882, are diffuse in style and frequently inaccurate in statement. The first lecture is upon "Ancient Costume," and a large portion of it is taken up with conjectural remarks on ancient Jewish dress which contain no information and can be of little use. The second lecture, on "Byzantine and Romanesque Painting," betrays a common misapprehension of the nature of Byzantine art and of the value of its leading principles. The unskilled drawing and the frequent uncouthness of form which are characteristic of it appear to be the only qualities which the author recognizes. Its ordered design, through which subsequent art derives some of the most fundamental principles of the Greeks, is quite ignored. The qualities of Byzantine design not being recognized as identical with those which lie at the root of Greek art—mere skill in graceful and lifelike modelling being, apparently, thought to constitute the highest excellence of the Greek sculptor—Mr. Armitage declares it "hard to believe that these hideous deformities

should have descended from ancient Greek sculpture." "But ancient art," he continues, "does not mean the art of Phidias and Praxiteles: it may mean the barbaric [!] sculpture which preceded the advent of these masters"; and he confesses that there is something in the "odious grimace and the stiff draperies of Byzantine figures" which reminds him of this. "A certain traditional arrangement of folds" in Byzantine art he affirms to be derived from late Roman works. We think that a more adequate study of that "taste in ornament" which, as he admits, shows that the Byzantine artists were "not deficient in artistic capabilities," would tend to change his estimate of that great old school which gave us the mosaics of St. Mark and of Ravenna. It is an injustice to students to give them such false notions of one of the most important ancient schools. They should be helped, rather, to see that underlying the most repulsive forms of Byzantine art there are vital principles which it behooves them to appreciate—principles which form the basis of even the most fully-developed design in the Italian schools, and by virtue of which that design is separated by a great gulf from all that is merely picturesque or naturalistic.

In the third lecture, on "Eighteenth-Century Art," Reynolds and Gainsborough are spoken of disparagingly, while, in the author's opinion, Hogarth and Copley are the only English figure-painters of that century whose merit would be acknowledged by an intelligent foreign critic. Contrast with this the judgment of M. Ernest Chesneau, who, in his recent book on English painting, says: "Hogarth est avant tout un peintre moraliste. Reynolds et Gainsborough, au contraire, sont vraiment des peintres." In the next lecture, on "David and his School," these highly conventional painters are characterized as "really great artists," while the truly refined and beautiful English painter Stothard is mentioned with slight praise. In the lecture on "Drawing" are some highly questionable precepts on proportion—as where, on page 119, the student is advised to "make the leg, from the patella downward, somewhat longer than it is in nature." Length of leg, it is added, "gives style and elegance to a figure.' There are, however, some good remarks in this discourse on the expression of movement in figures of men and animals. The unsatisfactory character of those positions which have lately been obtained by instantaneous photography is well illustrated. The key to the expression of rapid movement is shown to be in the length of the stride in running, or of the stroke in rowing; and to produce the impression of such movement we must choose the moment when the stride or stroke displays its full reach. If, in the case of running, we choose the moment when one leg is passing the other, our drawing may be equally truthful, but it will convey no impression of rapid movement.

The remarks on color are singularly inadequate. They contain little more than some hints and suggestions regarding the properties of pigments, and their combinations and mutual relations. There is nothing whatever concerning the fundamental principles of coloring in art and nature. The lecture on "Decorative Painting" is equally remarkable for paucity of ideas. It is concerned, from first to last, with materials and processes, rather than with principles, while the lecture on "Finish" treats largely of the employment of models and lay-figures, and other irrelevant matter. In treating of composition, little more than arbitrary rules and personal preferences are given. On page 219 the author says: "A rule which it is well to observe in all decorative work is to avoid cutting off any portion of the figures." Yet the great designers frequently and freely cut off portions of their figures with admirable effect—as may be seen in the panels of the pulpit of the Baptistery at Pisa, by Niccolo Pisano, in the "Deposition" in San Lorenzo at Florence, by Donatello, and in the works of numerous other sculptors and painters of equal excellence. On page 244 Mr. Armitage speaks against the practice of representing stooping, sitting, or kneeling figures without enough space over their heads to allow them to stand up, and says: "The mannerism of introducing figures too large for the canvas originated probably with the old German masters of the Albert Dürer school. With them, however, it was not a mannerism, but a habit contracted by wood-engraving." But the fact is that this "mannerism" is as old as the art of design itself. It may be enough to cite as instances the Egyptian portrait of Rameses II. in the Louvre, some portions of the Parthenon frieze, and the reliefs for the organ gallery of the Cathedral of Florence by Della Robbia. Finally, on page 245, we have this: "As to the actual dimensions of the figures in historical or 'genre' subjects, there is only one size which I think objectionable, and that is rather smaller than life." The size here objected to is precisely that chosen for their mural paintings with such admirable effect by nearly all the great Florentine designers, from Giotto to Raphael.

The sixth book in the "Great Artists Series" is a sequel to the volume on Ghiberti and Donatello, and other early Italian sculptors, which we noticed some months since. That gave an outline of the rise of Italian sculpture to the schools founded by Ghiberti and Donatello, and this continues the narrative through the 15th and 16th centuries. The work appears careful and accurate as regards the leading biographical facts, and for these it will doubtless prove interesting and useful to the general traveller. There are some good passages embodying observations on the bearing on the arts of the events and conditions of the times treated of, as on p. 90, where, regarding the causes of decline of the schools of sculpture, it is said that it was "partly because imitation had taken the place of inspiration and invention; partly because patronage, instead of being patriotic, as in the early days of the Republic, was private and courtly, the decorations of villas and private palaces failing to call forth the higher nature of artists, as the beautifying of churches and creation of great national works had done; and partly on account of the entire change of thought and aims brought about by the humanistic teaching of the Renaissance." It might be added that the sundering of the arts one from another had much to do with the decline. Among the reflections which force themselves upon the mind in perusing the biographies of Italian artists of the early and central times, is the significant one that these masters were so versatile in genius and in skill. In the majority of cases the same person was at once architect, sculptor, and painter, as well, frequently, as worker in the minor branches of engraving, ornamental metal-work, etc. This forcibly illustrates the fact that all the branches of the fine arts spring from one root, that they are essentially one, and that a true artist, whenever the external conditions favor the free and full development of his faculties, is competent to work equally well in any department of the general field. The history of the arts, too, shows that all departments have prospered in proportion as artists have been thus versatile in practice, and as all the arts have been cultivated together.

As a critic Mr. Scott does not impress us as very discerning. His chief praise for so refined and charming a master of expression as Mino da Fiesole is that "he seems to have wrought the marble till it became soft under his hands," and of Verrocchio he says that he "was not endowed with, and did not achieve, great excellence in any branch." The frequent and needless use of Italian terms not likely to be generally understood by the English reader—such as *stipiti, scarpello, stecchini, gradino, tucco*, etc.—is objectionable, especially in a book intended to be used as a traveller's guide. On p. 101 an illustration is referred to, as on p. 96, which is really on p. 100. The woodcut illustrations are of fair average quality, with exception of the portraits, which are unusually poor.

The chief aim of the "Handbooks of Practical Art" is, according to the editor's note, to bring to the notice of students and amateurs a series of examples, both ancient and modern, of the application of beautiful designs to articles of every-day use, and to the various objects which are frequently employed for purposes of decoration. The aim is a very good one; but it is certainly not well carried out in these two volumes, both of which contain a great many more bad designs than good ones. Indeed, the quality of each book is pretty fairly indicated by its frontispiece, which, in the case of the work on Gold and Silver, represents a coarse modern French design in onyx and enamel, while in that on Porcelain we have a Sèvres vase, in which the severity of Greek form and ornamentation is mechanically copied and associated with a sentimental figure-design in modern pictorial treatment. The fact is, that for examples of beautiful art, modern handicraft in gold and silver and in porcelain presents a mostly barren field, from which very little that is worthy of being held up to students and amateurs as models of taste can be gathered; and there is certainly no real profit to be derived from the study of Milton shields, Dresden china, and kindred objects with illustrations of which these books abound. The text in both books is inadequate and superficial. The briefest historical outline is given; but there is no rational elucidation of principles, or any discriminating guidance.

In a pamphlet of thirty-one pages Dr. Fletcher describes the various ancient and modern systems of human proportion, in which some one part of the body is taken as a modulus, and briefly discusses their supposed employment in the fine arts of the past. He then shows that all these systems are fallacious, since there is, in reality, no such relation of any one part of the body to all the other parts, as they assume; but he argues that the new system of anthropometry—which bases its results upon a mean derived from measurements of a vast number of individuals—may be expected to yield a true and serviceable canon of proportion. This system assumes that "there is a perfect human type, varying, to some extent, with sex, age, and race"; and that variations from this type are due to the law of accidental causes. Without undertaking to discuss this point, which involves some very profound considerations, we will say only, that whatever may be the value to science of this system, it can have no more value, in the field of art, than the older systems—which is very little, if any; for the artist does not work from formulæ, though it may sometimes be subordinately useful for him to be acquainted with them.

History of the Northern Pacific Railroad. By Eugene V. Smalley. G. P. Putnam's Sons. 8vo, pp. 437, map and illustrations.

THE first of the three parts into which this work is divided corresponds strictly to the title. Part 2 describes the physical features of the country

through which the road passes. Part 3 follows the course of the main line, with its stations, settlements, etc. The industry necessarily bestowed on the historical retrospect cannot readily be appreciated. The narrative begins with the early explorers of the Northwest via the Great Lakes, and the maritime discoverers of the Columbia River and Puget Sound. It then passes to the connecting link, the famous expedition of Lewis and Clarke set on foot by Jefferson during his Presidency, and actually begun just after the completion of the Louisiana Purchase. Like Jefferson, Lewis and Clarke were Southerners, and all unconsciously worked for the ultimate extinction of slavery by broadening the area of freedom. After them the South regarded expansion on that side of the continent only with apprehension and unfriendliness. New England was now to follow up the advantage acquired by a hostile section. A Boston sea-captain had already (in 1792) crossed the bar of the Columbia River; another, still earlier, had first sailed round Vancouver's Island and past the mouth of Puget Sound. The first popular advocacy of a national railroad between the two oceans—"from New York to the Columbia River"—was made (in 1834) by a Massachusetts physician, Samuel Bancroft Barlow. He was not, however, the first to declare the feasibility of such an enterprise, nor does Mr. Smalley make that claim for him, though overlooking the probable original prophet, Caleb Atwater, another native of Massachusetts, in his 'Tour to Prairie du Chien' (1831). That more vigorous champion of the idea, Asa Whitney, likewise may, from his name, be presumed to have had a New England origin. Josiah Perham we know was a native of Maine (while yet a part of Massachusetts), and the first Northern Pacific Railroad Company was organized under his auspices in Boston (in 1864). The real enlistment of capital presently brought a Vermont element into control, and it has ever since been prominent in the affairs of the company. After the accession of Jay Cooke, as after his failure, the Pennsylvanian management became of the first importance. The final alliance of the Northern Pacific Railroad with the Oregon system was, again, effected largely by Eastern capital. The solitary settlement of Astoria at the mouth of the Columbia, founded by the German Astor, has at last been connected by rail with the Atlantic seaboard by his countryman, Henry Villard.

We need not attempt to summarize the struggles of the road just completed for existence. It was, after all, fortunate in suffering from the popular reaction against the mode in which the Union and Central Pacific roads had been subsidized by the national Government. Its land aid has been all, and will not be judged an excessive or unwise encouragement. It owed much to Thaddeus Stevens, who reported the first land-grant bill, and who forced the Union Pacific interest, when asking for favors, to support an extension of time for completing the Northern Pacific under its charter. It was the victim of Napoleon III.'s insane war upon Germany, through the consequent inability to market its bonds abroad at a critical moment. Mr. Smalley shows clearly, however, that failure was inevitable in 1873. The condition of the Northwest was extremely backward and most unpromising, and the extinguishment of the Indian titles to reservations on the Upper Missouri and the Yellowstone, which was not effected till 1880, was indispensable to the success of the road.

Mr. Smalley has accomplished his difficult task with a creditable degree of success. So far as he has been able, he has given biographical sketches of the men most prominent in all the romantic phases of the achievement, and his account of the financial operations may be taken as absolutely authoritative. For the Lewis and Clarke expedition he might have referred to and profitably consulted Dr. Coues's bibliography.

What Social Classes Owe to Each Other. By William Graham Sumner, Professor of Political and Social Science in Yale College. Harper & Brothers. 1883.

THIS little book consists in the main of a plea for laissez-faire, which is, being interpreted by the author, minding your own business. Advice of this kind is notoriously hard to give, and we cannot say that Professor Sumner has taken pains to make it palatable. He is evidently of the opinion of the Irish priest who, after having bitterly complained of the brutishness of his parishioners, was asked whether they were unaffected by the preaching of the Gospel, and replied that he was not going to waste the good Gospel on the likes of them. The argument is strong and convincing, but those who have held different opinions from the author's are likely to be convinced against their will. They may be bullied into silence and hammered into submission, but they will not make trustworthy recruits. We consider, however, the fact stated by Professor Sumner, that during the last ten years he has read a great many books and articles by German writers, exalting "the state" as a tutelary genius over us all, to be a sufficient excuse for his asperity, and would by no means convey the impression that his adversaries get worse treatment than they deserve. It is sometimes necessary to break your opponent's skull in order to get access to his brain.

The particular fallacy which this book is intended to explode, is that of regarding the state as something more than the people of which it is composed. Every attempt to remedy a social ill by state interference is an attempt to make some people take care of others. When the evil is the result of bad political institutions, then it may be the duty of one social class to see that these institutions are reformed. But when the evil is due to natural causes, nothing but injustice and mischief can result from compelling those who have escaped it to relieve those who suffer from it. Most of the evils complained of nowadays which the state is urged to remedy, arise from the wickedness and folly of mankind. State relief consists in transferring the punishment from those who have deserved it to those whose virtue and wisdom have exempted them from it. The "forgotten man," the sober, industrious, and prudent workman, has to pay the cost of all the commissions, bureaus, and departments that are so rapidly increasing in number.

It is of course impossible to treat thoroughly such a theme as this within the limits the author has set for himself, and still more so to attempt any detailed criticism within the space at our command. We can only say that society is to a certain extent organized as a protest against the remorselessness of the law of natural selection, and that the argument for laissez-faire, to be conclusive, must take account of this fact. We think also that Professor Sumner seriously underestimates the extent to which riches are gained by dishonest practices. Few large fortunes have a perfectly honorable history, and, even where no personal taint attaches to their possessors, they are frequently due to the existence of unjust privileges. It is hardly a satisfactory reply to this to say that the people have created these privileges and have no right to complain of their results. The people are incapable of comprehending the results of their legislation unless educated men like Professor Sumner recognize the duty of labor in the work of political evangelization.

Although we cannot help regarding some of the author's statements as too sweeping and therefore seriously weakening the force of his argument, yet the conclusions he reaches are substantially unanswerable. If the force now wasted in futile and harmful socialistic schemes were devoted to the improvement of existing institutions, we should all be much better off, and moreover, we should be working in the right direction instead of in the wrong one. As Professor Sumner says, a free man is a sovereign, but a sovereign cannot take "tips." If the state is to do for any class what that class can do for itself—that is, if some of us are to be made to bear the burdens resulting from the idleness and improvidence of others—the independent, self-reliant citizen will have a hard time of it. No more important doctrine than this can well be proclaimed, and our country owes a debt of gratitude to whosoever will proclaim it in the sturdy, straightforward style of this book. We need not despair of the Republic while our young men are fed upon such meat as this. Whether Professor Sumner's pupils adopt his conclusions or not, they cannot fail to be stimulated by his reasoning. To follow him or to differ with him takes strong and clear thinking, and we congratulate not only them, but those whom they will hereafter influence, upon instruction in politics worthy of the importance of the subject.

Studies in Philosophy, Ancient and Modern. By W. L. Courtney. London: Rivingtons. 8vo, pp. 204.

Essays in Philosophical Criticism. Edited by Andrew Seth and R. B. Haldane. London: Longmans, Green & Co. 8vo, pp. 277.

THE two volumes of philosophical essays before us, 'Studies in Philosophy,' by W. L. Courtney, and 'Essays in Philosophical Criticism,' by Professor Seth, Messrs. Haldane, Professor Caird, and half-a-dozen other authors, are interesting as showing the present state of the Kantian Philosophy in England. They seem all to be somewhat affected by the influence of the late Prof. Thomas Hill Green, of Oxford, and an obvious likeness runs through their writings—a tone very different from that of the American students of this school. These Englishmen are not satisfied with vague thought or obscure expression. There is no twaddle about things thinging themselves, and the like. Where our American writers too often adopt a style of prophetic inspiration which asserts and scorns to reason, these Englishmen cautiously explain why they think as they do, and strive to make themselves clear even to those who do not agree with them. This is no small attraction. Abstract thought is at the best difficult enough to pursue without having the additional difficulty of imperfectly intelligible English added to it. The reading public have a right to have the philosophy which is presented to them written in clear, perspicuous, consecutive English, just as they have a right to have the book clearly printed, and the words rightly spelled.

We have called these writers Kantian because they agree in following the general line of investigation opened up by Kant, and which Hegel pursued with greater or less success. They do not attempt a precise reproduction of the work of those philosophers.

"Valuable as may be the history of thought," says Professor Caird, "the literal importation of Kant and Hegel into another country and time would not be possible if it were desirable, or desirable if it were possible. The mere change of time and place, if there were nothing more, implies new questions and a new attitude of mind in those whom the writer addresses, which would make a bare reproduction unmeaning. Moreover, this change of the mental atmosphere and environment is itself part of a development which must affect the doctrine also if it is no

mere dead tradition, but a seed of new intellectual life. Any one who writes about philosophy must have his work judged not by its relation to the intellectual wants of a past generation, but by its power to meet the wants of the present time—wants which arise out of the advance of science, and the new currents of influence which are transforming man's social and religious life."

We have quoted this passage at length because it has such a valuable lesson in it for our own writers. The Kantian philosophy is a tender exotic here in this country. One cannot approach it without entering a hothouse whose overloaded atmosphere betrays the artificial attempt to reproduce thoughts no longer in living relation to our time. These English essays, however, are more practical, treating modern science and history and art and religion from the standpoint of idealistic philosophy. They discuss Spencer's evolution of the social organism, and Darwin's struggle for existence, and the new ethics of positivism, with a real appreciation of their value.

"If," says Mr. Courtney, "we confine ourselves to broad general issues, and ask to which side will tend the future speculations of English psychology, the answer is hardly doubtful. For many reasons it seems likely that the ultimate victory in England will rest with the side which lays its stress on science and experience, . . . [on account of] the constitutional English dislike of subtlety, and its preference for that which affords solid and tangible results. And if this be so, it becomes a matter of some importance to adapt to the newer standpoint some of those practical studies and disciplines which have hitherto been modelled on the older lines. There is little doubt, for instance, that the science of education has been hitherto based on something like the Platonic idea of the soul as a separate and special substance in authority over the body. And the science of ethics, too, has undoubtedly some of the old spiritualistic Adam about it, with its insistence on ideal duty and authoritative conscience and categorical imperatives. Conceptions such as these must either disappear or be vitally transformed in the crucible of experimental ethics."

These essays are analytical and critical, not constructive. And there is in them occasionally a doubt about fundamental ideas and an unwilling obedience to practical considerations that is characteristic of our day. Mr. Courtney's volume is decidedly the more brilliantly written of the two, and gives hopes for excellent future work. Both books are attractively printed.

The Fertilization of Flowers. By Prof. Hermann Müller. Translated and edited by D'Arcy W. Thompson, B.A., Scholar of Trinity College, Cambridge. With a preface by Charles Darwin. London and New York: Macmillan & Co. 1883.

We begin our notice of this book sorrowfully with the announcement of the death of the author, which, as we are at this moment apprised, took place in the Tyrol on the 25th of August—prematurely, we judge: for the earliest of the researches which have made his name illustrious in this new branch of biology was published as late as the year 1869, and the original edition of 'Die Befruchtung der Blumen' appeared in 1873. Moreover, the work now so neatly rendered into English by Mr. Thompson, and enriched by "a large mass of Dr. Hermann Müller's recent observations," carries a saddening reminder in the preface by Darwin, "full of suggestion, full of kindly, appreciative feeling," which was one of the very last of his writings. A crowning merit and advantage of Dr. Müller's work is that he investigated with equal painstaking and with equal acuteness the mechanism of the flower-visiting insects and the progressive development of their adaptations, and of the blossoms visited and benefited. Part 2, on "The Insects which Visit Flowers," with its beautiful illustrations, is therefore of special interest to readers and students in this country; Part 3, taking up the flowers in their natural orders, and enumerating the insects known to visit them, is encyclopædic, and is also capitally illustrated; while Part 4 takes a general retrospect of the various structural features of flowers, tracing their general effects on the life of the plant and the course, if not the causes, of its modifications. At the end there is a very full bibliography, drawn up by the English editor, and revised by the lamented author. The historical introduction lets us know how well Dr. Müller appreciated his countryman Christian Conrad Sprengel, who, in that long-forgotten and lately resuscitated volume which was published just ninety years ago, originated this curious branch of biology. By the equally "rich store of his patient and acute observations and his comprehensive and accurate interpretations," inspired and clarified by the broader teleological view opened by "the Knight-Darwin law," the lamented author of the present elaborate treatise (covering nearly 700 pages, 8vo) has restored the German ascendency in this interesting line of inquiry, and attained the highest position in it.

A text-book on this subject was much wanted. The way for it has been well prepared in this country, and we expect that this volume will have very many readers.

BOOKS OF THE WEEK.

A Kempis, T. Of the Imitation of Christ. Boston: J. R. Osgood & Co. $1.
Alexander, Mrs. The Executor: a Novel. Henry Holt & Co. $1.
Briggs, R. Steam Heating. D. Van Nostrand. 50 cts.
Brown, Susan A. Mrs. Gilpin's Frugalities. Charles Scribner's Sons. $1.
Bunner, H. C. A Woman of Honor. Boston: J. R. Osgood & Co.
Cleland, R. Inchbracken: a Novel. Glasgow: Wilson & McCormick.
Davis, W. F. Saint Indefatigable: Sketch of the Life of Amarancy Paine Sarle. Boston: D. Lothrop & Co. 75 cents.
Dixon, D. B. The Machinist's and Steam-Engineer's Practical Calculator. D. Van Nostrand.
Eggleston, E. The Hoosier School-Boy. Chas. Scribner's Sons. $1.
Emerson, R. W. Representative Men: Essays. Second Series. 2 vols. Boston: Houghton, Mifflin & Co. $1 75 each.
Ewing, Juliana H. Blue and Red; or, The Discontented Lobster. E. & J. B. Young & Co.
Fisher, Prof. G. P. The Grounds of Theistic and Christian Belief. Chas. Scribner's Sons. $2 50.

SCRIBNER & WELFORD,
No. 745 Broadway, New York.

753-755 Broadway, New York, Sept. 20, 1883.

NOTICE TO TEACHERS & SCHOOL OFFICERS:

The success of Swinton's Readers, just published, has been so marked—more than 250,000 copies having been called for during the past sixty days—that we have been unable to fully keep up with the demand for them, and are compelled to ask the patience of those whose orders remain unfilled. We shall be prepared, in a few days, to supply the books in any required quantity; meantime we can only regret the disappointments and annoyances ensuing through this delay.

Swinton's Readers.

AN ENTIRELY NEW SERIES OF SCHOOL READING-BOOKS, IN FIVE NUMBERS.

By Professor WILLIAM SWINTON.

IN PRESENTING this new series of school reading-books to the educational public, the publishers believe they are not claiming too much when they say that they are the most carefully edited and most beautiful series of school text-books ever issued from the press.

SWINTON'S READERS *are preëminently* LANGUAGE READERS. It is the conviction of the author of the books that *the reader is the real focus of school language-study.*

The illustrations are by the most eminent American artists: Church, Dielman, Fredericks, Pyle, Harper, White, and others, and were drawn expressly for these books.

I. *SWINTON'S PRIMER AND FIRST READER.*—In print and script exercises. The script exercises are a specially attractive feature, being white on black, as in blackboard and slate work, the script being the result of careful experiment in securing a practical style of letter for this sort of work. Another noticeable feature of this book is the type, which was made for us, and which is unlike any other font of type heretofore cut, in the matter of size and face. Handsomely illustrated, and bound in cloth. *One volume;* 120 *pages.*

II. *SWINTON'S SECOND READER.*—In print and script exercises. This is also a beautiful book, and commends itself especially for its grading, for the purity and sweetness of its literary form, and for the development of "language work." Illustrated, and bound in cloth. 176 *pages.*

III. *SWINTON'S THIRD READER.*—Presenting many new and original features. Noticeable for the charming series of original lessons entitled "Home Pets," "Bright Examples," and "About Plants." Illustrated, and bound in cloth. 240 *pages.*

IV. *SWINTON'S FOURTH READER.*—A book of choice selections for this important grade, carefully edited and arranged. It contains also many useful and entertaining original lessons, especially on "Useful Knowledge," and "Pictures of American History." Illustrated, and bound in cloth. 384 *pages.*

V. *SWINTON'S FIFTH READER & SPEAKER.*—This book contains abundant exercises in language, reading, recitation, and declamation. An instructive and entertaining original feature is the series of lessons under the title of "Glimpses of Science," presented in the highest form of literary art. Illustrated, and bound in cloth. 480 *pages.*

Sample pages and full descriptive circulars, by mail, to teachers and educationists.

*** *A set of the Readers, from the First to the Fifth inclusive, sent to any teacher or educationist on receipt of* $1.75.

IVISON, BLAKEMAN, TAYLOR & CO.,
PUBLISHERS,
753-755 Broadway, New York.

PUBLISHED MONTHLY.

Price 15 cts.; Annual Subscription, $1 50.

No. 1 ready Monday, Oct. 1.

The English Illustrated Magazine.

The price at which it is issued justifies the belief that it will appeal to a large and varied circle of readers, and an endeavor will be made in the choice and arrangement of its contents to satisfy the tastes of all who are interested in Literature and Art.

By the help of numerous engravings, which will be applied to the illustration of every theme wherein the services of Art can be fitly employed, it is intended to give to the pages of

The English Illustrated Magazine

a wider scope and a more vivid and varied interest than can be attained by the unaided resources of printed text, while at the same time the presence and support of writers of reputation in every branch of Literature and Science will effectually distinguish the new publication from those illustrated periodicals which are exclusively devoted to the study and criticism of art.

The English Illustrated Magazine

is designed for the entertainment of the home, and for the instruction and amusement of young and old; and it will be conducted in the belief that every section of its readers, in whatever direction their tastes and interests may tend, are prepared to demand and to appreciate the best that can be offered to them.

Fiction, in the shape of short stories or longer serials, will always find a place in the pages of

The English Illustrated Magazine,

and Poetry will be admitted as often as it is found possible to secure contributions from acknowledged masters of the craft. The Magazine will also contain studies in History and Biography, and records of Travel, together with descriptive papers on such places in our own Empire and in foreign countries as, by right of natural beauty or the associations of art, have served to make travel memorable. It will treat from time to time of the serious occupations of our modern life, and of its pleasures and amusements, of our National Industries and our National Sports, touching, as the occasion offers, upon all topics, Literary, Artistic, Scientific, and Social, which are of interest to English-speaking peoples throughout the world.

CONTENTS OF NO. 1:

SHY. (Frontispiece.) By L. ALMA TADEMA, R.A. From the Picture in the possession of D. O. Mills, Esq., New York.

FROM THE OLD LAW COURTS TO THE NEW. By F. MAITLAND. With illustrations by H. Furniss, John O'Connor, and A. Morrow.

LES CASQUETTES: a Poem. By ALGERNON CHARLES SWINBURNE.

THE DORMOUSE AT HOME. By GRANT ALLEN. With illustrations by Chas. Whymper.

ROSSETTI'S INFLUENCE IN ART. By J. COMYNS CARR. With illustrations after D. G. Rossetti.

THE SUPERNATURAL EXPERIENCES OF PATSY CONG. By WILLIAM BLACK.

OYSTERS AND THE OYSTER QUESTION. Part I. By Prof. HUXLEY, P.R.S. With illustrations.

THE ARMOURER'S PRENTICES. Chapters I. and II. By CHARLOTTE M. YONGE.

MACMILLAN & CO.,
112 Fourth Avenue, New York,
AND ALL BOOKSELLERS AND NEWSDEALERS.

The Nation.

NEW YORK, THURSDAY, OCTOBER 4, 1883.

The Week.

THERE are signs of an approaching struggle in Congress over the wool tariff. The Wool-Growers' Convention at Chicago the other day demanded the restoration of duties to the figures which ruled before the tariff revision of last winter was effected, and censured by implication the action of their representative on the Commission, Mr. A. M. Garland. The reduction in duty was effected by changing in some small degree the classification of imported wools, and by striking out the ad-valorem part of the duty altogether and slightly augmenting the specific. Thus, under the old tariff, clothing wools worth 32 cents or less per pound were taxed 10 cents per pound and 11 per cent. ad valorem. Under the new tariff clothing wools worth 30 cents or more per pound are charged simply 12 cents per pound. The reduction is small, but it has been sufficient to excite the ire of the wool-growers, while it has not saved the woollen manufacturers from loss. The contest is pretty sure to reach Congress before many months. It will then be seen that the manufacturers, however generous the natural instincts of their hearts and the tender memories of the past might prompt them to be, are unable to yield a hair's breadth. They are in the last ditch now, and they might as well die fighting the wool-growers as fall under the weight of an additional burden on their raw materials. The case of the wool-growers has very little merit when we reflect that if worst comes to worst they have only to turn their grazing lands to some other use, the whole boundless field of farming being still open to them, while the manufacturers' machinery is good for nothing but the making of woollen cloth, suspension of which means irretrievable ruin.

The leasing of Mr. Blaine's house in Washington, in which he expected to receive his friends for so many years to come, is probably a sign that he is not so completely out of politics, and so wholly given up to literary pursuits, as his friends have of late been trying to persuade us. There is no better place for literary pursuits, especially those of an historical nature, than Washington, and Mr. Blaine's library is said to have been an excellent workshop for the student or philosopher. But it has lately been made plain that the country voters object strongly to the owning of fine houses in that city by politicians who seek marks of their confidence. They prefer that they should build their houses at their political "homes," and not pretend to have a permanent residence at the capital. Accordingly, we may safely assume that in declining to occupy his mansion Mr. Blaine is getting rid of encumbrances in preparation for the fray. Mr. Windom's fate doubtless keeps him awake. Mr. Windom built himself a fine house in Washington, but his enemies found a photograph of it a very effective weapon against him in his Senatorial canvass.

Ex-Senator Thurman has joined the other Democratic statesmen in explaining that a tariff, when rightly adjusted, is merely a philanthropic agency for the happiness and prosperity of the whole people. He says there is no party in this country which can be said to be composed of free-traders in the sense that by free trade is meant the abolition of all customs duties. What he and the Democratic party propose is just enough tariff to pay the necessary expenses of the Government, so adjusted as not to foster monopolies, but merely to afford the desirable amount of protection requisite to prevent injustice from being done to anybody. In other words, the Senator is a believer in the formula of "tariff for revenue with incidental protection," and the drift of the whole Democratic party is in the same direction. Of course Mr. Thurman, and every other Democrat who has any knowledge on the subject, know that the formula is a grotesque absurdity, which means nothing to anybody except that the Democratic party does not dare to express any open hostility to protection. Nobody will be deceived by this shuffling, least of all the independent voters who are becoming more disgusted every day with the Democratic tendency to dodge every important national issue.

Judge Hoadly's belated speech does not appear to be a valuable contribution to the political literature of the time. It had evidently been so thoroughly "revised" that no dangerously progressive views were left in it. The Judge said he had left the Republican party because since the settlement of the slavery question it had had no "guiding principle," but he failed to point out precisely what the principle is which holds that position in the Democratic party. It clearly is not the tariff, for the Judge avoided dangerous ground on that issue by saying that nothing is to be done with it for three years. This is a longer postponement than the protectionists have hoped for, and the Judge's words will be a great comfort to them. The only hint in the speech of anything like a guiding principle is the declaration that the "Democratic party is the party of governmental economy and personal liberty," which bears so close a resemblance to the prevailing Democratic demand for a "return to constitutional government" that we infer that the Judge has become imbued with that idea, and joins the rest of his party in making it the chief issue for the next Presidential campaign.

The platform of the New York Democrats has the merit of being a novelty among the platforms of the year. Instead of indulging in profuse promises for the future, it consists almost entirely of complacent references to the past. No national question is touched upon at all. The tariff, civil-service reform in its national aspects, silver coinage, taxation—all are ignored. Even the time-honored declaration in favor of the protection of American citizens in foreign lands is omitted, and there is no reference whatever to the stentorian demand of the Democracy everywhere for a "return to constitutional government." The Convention was evidently so completely absorbed in the task of uniting the party that it had no time or strength to devote to ascertaining whether it had any "principles" or not. On the whole, this seems to us the wisest course for the party to pursue. The *Sun*, speaking with all the weight of a national Democratic authority, says that a "great many Democrats become fools when they talk about civil-service reform so called"; and if the remark be extended so as to include the tariff, it is difficult to see how any one can successfully dispute the truth of it.

The Massachusetts Democrats believe in the Supremacy of the Nation, but at the same time do not forget the Integrity of the State; they promise, if admitted to power, to give equal rights to all, without distinction of race or sex. They are in favor of making the freedom of the ballot "impartial"; of honesty and economy in State and Nation; of a thorough reform of the civil service; and of a tariff limited in amount to the sum necessary and adequate for revenue. There is nothing new in all this, and the Republicans are sound on all these questions unless it be the very last of them. There is one point, however, on which that party has not spoken, and as to this the Democrats speak in trumpet tones. They demand the "careful consideration" by the Legislature of the necessity of a law securing to all employees compensation from their employers for any personal injuries they may receive while in discharge of their duties. The Republicans overlooked this branch of the labor problem, no doubt blinded to it by their secret sympathy with the employing class. But it is too late now.

One of the most extraordinary incidents in Butler's history was the appearance of three of his followers, one of them a woman, at the Charities Conference at Louisville the other day, as delegates to make a report on his Tewksbury almshouse crusade, in which they compared him both to Julius Cæsar and to the Saviour of mankind. This led to a sharp retort from Mr. F. B. Sanborn, of Massachusetts, and something like a row at the close of the proceedings. No corner of the continent now seems safe from the labors of Butler's emissaries, but he ought to revise their reports, and especially their eulogies. His enemies are triumphing over him now by pointing out that he cannot be properly compared both to Christ and to Julius Cæsar, because these personages were so different. This, at first sight, does seem a fatal criticism, but he will easily evade it, in the eyes of his "crowd," by explaining that sometimes he resembles the one, sometimes the other. In fact, he owes a large part of his success to his absurdity. It is largely the grotesque and ridiculous things he has said and done which have made his fame and popularity. The truth is that there

are plenty of people in the world like Butler; the really odd, unique, unprecedented thing in his surroundings is the constituency which made him Governor. There are thousands of charlatans ready to be as ridiculous and shameless as he, if they can thereby get high office.

The full text of Mr. Justice Field's decision in the Chinese case at San Francisco has come to hand. It overrules, or, rather, controverts, Judge Lowell's decision in Massachusetts that Hong Kong Chinamen, being British subjects, and therefore not within the purview of the treaty with China, are not excluded from the United States by the act of Congress. Judge Field holds that the act of Congress contains all the law of the matter which the courts need regard, and that this clearly intends the exclusion of all persons of the Chinese race wherever born. He accordingly sent back to the ship a Chinese immigrant who had been brought before him on habeas corpus. It remains to be seen now what the British view of the matter is. The British law certainly knows nothing of two classes of subjects, each entitled to a different degree of protection, but at the same time it is doubtful whether any objection could or would be taken to the classification of British subjects by a foreign Power for the purpose simply of exclusion from its territory. Every government can exclude any class of foreigners it pleases from its soil, subject, of course, to retaliation by their government. Anyhow, if Judge Field's ruling stands, it saves the act of Congress from complete nullification, because there are enough "Asiatic hordes" in Hong Kong to flood the Pacific slope with their cheap and useful industry.

The latest Mahone circular is an earnest appeal to his followers to circulate the Washington organ of the Administration, the *National Republican*, among the people of Virginia, as the only means by which to refute the "specious appeals" of the opposition press. This places the Administration in the unpleasant position of not only supporting Mahone with patronage, but with having the newspaper which is edited by an official of the Government used as the chief exponent of Mahone's repudiation and anti-civil-service reform principles. We observe with much pleasure that the Postmaster-General is asserting his authority as the head of his Department, and is doing all he can to check the political activity of his First Assistant, who is the editor of the *National Republican*. If the President would follow this excellent example, he would give genuine pleasure to every true friend of his administration.

If the National Convention of Colored Men was designed to further the political ambitions of any Presidential candidate, it has failed gloriously to fulfil its mission. The delegates were disposed to regard it mainly as an arena for free speech, and all efforts to commit them in a body to any political policy or candidate were hooted down with an uproar which is gratifying evidence that the colored voters are learning to exercise the freeman's prerogative of voting as he pleases without dictation. An attempt to commit the Convention irrevocably to the support of the Republican party was fairly howled out of the Convention on Wednesday week, and a subsequent attempt to endorse President Arthur shared a similar fate. The address adopted by the Convention is upon the whole a moderate and well-considered document and one calculated to make a favorable impression. Its most striking feature is the absence of any complaint in reference to Kuklux outrages or to intimidation at the ballot-box. It may be inferred from this that the outrages have ceased, and that intimidation, if it exists, is of a kind which cannot be reached by legislation. The elimination of this factor in national politics is a prodigious gain all around. It clears the way for reforms in other directions which could never gain a hearing while the story of such grievances filled the public ear, and touched the hearts of all who gave it credence. The address deals chiefly with the social problem, and proposes only moral means for its solution. It recognizes the fact that a tremendous revolution has taken place in the South, wholly in the interest of the colored people, and little short of miraculous in bringing about their emancipation. It acknowledges that the adjustments requisite to a satisfactory condition of society must be the work of time. The allusion made to the failure of the Freedmen's Savings Bank, and the demand that the United States should pay off the depositors, are the least that could be expected from the victims of that disgraceful crash.

Judge Hand, the referee in the action of the State against the Western Union Telegraph Company, to recover the back taxes due for the year 1881, under the new corporation tax laws of this State, has given judgment for the State in the sum of $178,397 26. Other taxes due will, in accordance with the principles of this decision, make the total amount recoverable $626,000. The important point in the decision is that this tax is levied, under the acts of 1880 and 1881, not upon that portion of the capital stock of Western Union invested in this State, but upon the entire capital. Now, Western Union is chartered in many different States, and if one of them can raise such a tax, any or all of them may, and the concern might thus be taxed out of existence. The question is one which affects all telegraph and railroad companies, and many other varieties of corporations doing business in different States. It has arisen in Pennsylvania, whose corporation tax law we have copied, but it is still to be seen how the courts of last resort will deal with it when it comes properly before them.

The decision of the District Court of Hamilton County, Ohio, concerning the liability of Catholic Church property for the late Archbishop Purcell's debts, while not likely to be accepted as final by the creditors, is of great importance. The Court holds that the Church property in the diocese, consisting of church edifices, asylums, schools, etc., cannot be sold to satisfy the claims of the creditors, except in those cases where it can be shown that the property was acquired either in whole or in part by money furnished by the Archbishop. These are comparatively few, and as there are 3,500 creditors and $4,000,000 of indebtedness, the proceeds obtained would afford small relief. The decision is based on the ground that although the title to the Church property was in the Archbishop's name, still it was not his own property, but was held by him, under a rule of discipline of his Church, in trust for various congregations. The case will probably be carried to the State Supreme Court.

The estimates of the crops of the various countries of the world, as reported by the International Congress which met at Vienna on the 27th of August, showed that the wheat crops of all the largest consuming and also of all the largest exporting countries of Europe were below last year's, and many of them largely so. Taking 100 to represent an average crop of the past five or ten years, the figures representing this year's crops were reported as follows, viz.:

	1883.	1882.
United Kingdom	80	100
France	85	100
Austria	85	111⅛
Hungary	100	157
Russia	77¾	102¾

From this it would appear that with the ordinary demand there should be a ready market for all the surplus wheat the United States will have to spare, unless prices are advanced by speculation so as to check consumption and consequently the export movement. Thus far the current exports of breadstuffs this year from the United States have been considerably below those of last year, but the estimates of crops above referred to afford the prospect that they will increase. The official reports of the exports of provisions show that these are largely in excess of last year's. Cotton exports are at present equal to last year's, but, in the depressed condition of the Manchester cotton-goods trade, they may not continue so. On the whole, however, it is reasonable to expect that the result of our foreign trade in the year ending June 30, 1884, will show a balance in favor of the United States as large as last year, viz., $100,000,000. Last year this credit balance was largely offset by the selling of American securities by European holders. This year they have few such securities to sell, and the credit balance will be paid in specie. This is the expectation in London; the Bank of England has been preparing for it ever since last June, when the rate of discount was advanced to 4 per cent. The Bank has been gaining specie all summer from the Continent, and now that a large surplus has been accumulated, the Bank has this week reduced its rate of discount to 3 per cent., and will probably offer none of the usual resistance to an export of specie to this country.

The controversy in medical circles between the old code and the new code has been given a new turn in the New York Academy of Medicine by an address from Dr. Fordyce Barker, suggesting that the code question be ruled out of the Academy altogether and remitted to the County Medical Society, where it belongs, the Academy being a purely scientific body. This suggestion appears to be quite in the interest of regularity, and therefore worthy of adoption, but obviously the

main question is not settled by merely tossing it out of a place where it does not belong to one where it does belong. The issue between the two divisions of the medical fraternity is really between the "code" (as regards consultations with homœopaths) and no code at all, although the record, as made up, presents it somewhat differently. The advocates of no code claim the right to practise their profession simply as men of honor, each to be the judge of his own duty in any particular case. The other side contend for the readoption of the code of former years, which was rescinded by the State Medical Society two years since. The decision of the main question cannot be much longer delayed, although Dr. Barker's motion to throw it out of the Academy seems quite reasonable.

Mr. Murray, of Adirondack and other fame, and for some time a popular minister in Boston, has taken to lecturing against the received Christian theology, beginning on Sunday in this city. The lecture was, however, probably simply a "prelude" to the announcement that he was going to deliver one hundred lectures throughout the country, and would afterward open a law office in San Antonio, Texas, and that "he owed a few debts," which he would pay "in a short time." The law is a profession, however, in which success is so difficult that nobody can well begin it too early, and a gentleman who is going to enter it with a gray beard and hair has not a day to lose, especially if he has a few unsatisfied debts. We would therefore suggest the abandonment of the hundred lectures, and the prompt opening of the San Antonio office, and the postponement of any further demolition of the Pentateuch and the theologians. They will always keep, and Mr. Murray can take them up after he has built up his practice and settled with his creditors. The latter have ten times more importance to him than the theologians.

The customs service on the docks of the foreign-steamship lines, where the baggage of passengers is examined, has been for some years performed as well, perhaps, as our complicated tariff laws would permit. Blackmailing by inspectors has been of such a shady character, if it existed at all, that nobody ever heard of it, and in this respect the contrast with former periods of the service has been very generally remarked. It appears, however, that on the 3d of September a customs inspector, upon the arrival of the steamer *Arizona*, used language to one of the passengers implying that unless the passenger would "do the square thing" he would get into trouble with his baggage. The passenger, in order to avoid trouble, gave the inspector $10, which the latter was not satisfied with, although he pocketed the money. The inspector has since been suspended pending an investigation. The case is one of the most flagrant in Custom-house annals, although the amount of blackmail involved is very small. If the facts are as stated by Mr. Whiteley, the passenger, to the *Herald* reporter, the inspector ought not only to be dismissed the service but prosecuted to the full extent of the law. The full extent of the law in such cases is ridiculously inadequate to the offence, being merely a fine of $50 for the first offence and $200 for the second. The case suggests a much-needed amendment to the statute. The extortion of $10 from a passenger ought to be punished with at least as much severity as the theft of the same sum by a pickpocket.

The *Herald* has a cool and moderate editoria article on the contest now going on between itself and the newsdealers, counselling every body to be patient and above all to be satisfied with small profits. The newsdealers, it says, can make a rate of interest equal to 16 per cent., or five times greater than that of the Government bondholder, by selling the *Herald* at two cents per copy. By selling it at three cents, it says, they make a profit of 80 per cent., which is altogether unreasonable at a time when the rate of interest all over the world rules so low. The newsdealer would probably reply that there is a noteworthy difference between himself and the Government bondholder, since the latter sits by a warm fire, with nothing to do but to cut off his coupons, whereas the former must go to the *Herald* office in all kinds of weather, take his backload of newspapers, pay office rent, fold his papers and carry them to his customers before breakfast, and often in the midst of pelting rain or snow. In other words, the difference to the newsdealer between the buying and selling price must cover not only the profit, if there be any, but remuneration for labor performed. Whether this can be done for one-third of a cent per copy is a question of fact more than a question of principle. Passion will be aroused in any contest where dollars and cents are involved, and we must not expect the newsdealers to behave more calmly than great railway officials when a war of rates breaks over their heads. It is quite in the usual order of things that the proprietor of the *Herald* should be denounced as a grasping Crœsus and an enemy of the poor, at a time when he has none of the sensations which usually characterize the bloated monopolist.

The position taken by the *Herald* has evidently been forced upon it. In any war of rates among newspapers the one which has the largest circulation must lose the most money by a reduction, since the loss takes effect upon each copy sold. A loss of one cent per copy to a newspaper having a circulation of 100,000 is equal to $300,000 per year unless the difference can be made good in whole or in part by increase of circulation at the reduced price. The *Herald* is the sole judge of its ability to stand the losses which result from its involuntary reduction in price. The newsdealers are likewise the exclusive judges of their ability to "handle" the *Herald* and serve it to their customers on a margin of one-third of a cent per copy.

A new field for woman's work is likely to be opened soon in London. Six women, who are students in the South London College of Chemistry, have so distinguished themselves in their classes that there is thought to be no doubt of their ability to pass the examination of the Pharmaceutical Society and receive certificates entitling them to become druggists. They will be the first women to undertake the business of pharmacy, an employment which is in many ways especially adapted to them. It is light and neat work, and the only objection which has been made to their performing it is their lack of the requisite scientific knowledge. That they can acquire this by the necessary application has been shown by the six London students. Certainly it cannot be claimed that the male druggists have always shown that exact scientific knowledge which is necessary in the business to make fatal mistakes impossible. There is no reason to suppose that women would be less careful in compounding medicines than men are.

Speaking of the bicentenary anniversary of the deliverance of Vienna from the Turks, on the morning after the festival, we remarked the singular fact that that capital had prepared for the celebration in ill-humor, grumbling at the Poles for their late anti-German votes in the Reichsrath, and therefore depreciating the merits of Sobieski, whom she hailed as her saviour in 1683. Full accounts of the commemoration since received show that it passed off entirely in that mood as regards the Poland of the past and present. It is surprising to see—and it casts a very disagreeable light upon the acrid nationalism of our days—to what extent King John III. and his heroic legions, and the country from which they came to save the Imperial capital and Christendom, were ignored in the congratulations, orations, and addresses which the Viennese and their imperial and city authorities showered upon each other. Vienna glorified herself, her ancestors, her German defenders, Charles of Lorraine, her Hapsburg-Lorraine dynasty; and the dynasty duly repaid her compliments. The best that was done for the memory of the Polish king was the insertion of his name at the head of the list of the conquerors on the solemnly unveiled tablet commemorating the battle of September 12. Had he not been the Commander-in-Chief and King, his name would, perhaps, have appeared last. Outside of Austria and Germany, however, the gratitude of Christendom almost uniformly designated the festival as the "Sobieski celebration." The remembrance of Sobieski as the deliverer of Vienna will probably long outlive his name as the designation of persons descended from his house; for two females, descended from a brother of the great-grandfather of King John, are the last survivors of the race—an unmarried octogenarian countess, of Warsaw, and her niece, the daughter of a combatant in the Polish revolution of 1830, born in exile, and married to a journalist of Cologne. The royal line of John Sobieski expired as early as 1740, with his granddaughter, the Duchess of Bouillon. Maximilian John Sobieski, who died in Covington, Ky., in 1875, and is mentioned in a German cyclopædia as the last descendant of John III., was probably as little a genuine scion of the royal house as our "Tom" Corwin, of Ohio, was a descendant of King Matthias Corvinus, of Hungary, a connection which was often claimed for him.

UMMARY OF THE WEEK'S NEWS·

[WEDNESDAY, September 26, to TUESDAY, October 2, 1883, inclusive.]

DOMESTIC.

THE politicians of the Democratic party began to gather at Buffalo on Wednesday for the State Convention. In the evening the State Committee held a meeting and voted (22 to 10) to put Tammany and Irving Hall on the list of delegates to be called in the first instance, instead of putting them in the place of contestants. This took the question out of the hands of the Convention. The Convention met soon after noon on Thursday, and ex-Speaker Chapin, as temporary Chairman, made an address calculated to please the Independents and Cleveland Democrats. Thomas E. Benedict, of Ulster County, was made permanent Chairman. The platform adopted reaffirmed the platform of the last State Convention, referred with pride to the reforms wrought by the Democratic State administration, and heartily endorsed Governor Cleveland. The Convention was altogether in the hands of the Governor, and a State ticket previously agreed upon by his friends was nominated in its entirety. It was as follows: For Secretary of State—Isaac H. Maynard, of Delaware County. For Comptroller—Alfred C. Chapin, of Kings County. For Treasurer—Robert A. Maxwell, of Genesee County. For Attorney-General—Dennis O'Brien, of Jefferson County. For Engineer and Surveyor—Elnathan Sweet, of Albany County. The only real contest was over the Secretary of State. Mr. Maynard got 209 and Mr. Purcell (Tammany and Irving Hall) 173 votes. Mr. Manning was reelected Chairman of the State Committee on Friday. It is estimated that twenty-four of the thirty-four members of the Committee are in thorough sympathy with the Cleveland-Manning wing of the party. It is believed that the party will be harmonious during the campaign.

At Syracuse on Wednesday the New York Prohibition State Convention nominated Frederick Gates, of Herkimer County, for Secretary of State, and a full State ticket.

At a meeting of the New York Republican State Committee in this city on Wednesday Mr. James D. Warren, editor of the Buffalo *Commercial*, was elected chairman by a vote of 17 to 14 for Chester S. Cole, of Corning.

At Springfield, Mass., on Wednesday, the Democratic Convention of that State met with more than 1,500 delegates present. The programme had been thoroughly prepared by the supporters of Butler, and was carried out to the letter. The Convention was organized in their interest, notwithstanding several violent speeches against them and a consequent uproar. Speeches were made eulogizing the Governor for his administration. Governor Butler was then unanimously renominated by acclamation. He appeared and made a long speech in praise of his administration and denunciation of his opponents. The platform reaffirms the national Democratic platform of 1880 and the State platform of 1882. It approves of Governor Butler's course in the Tewksbury affair, and commends him to the people as the only volunteer soldier ever elected Governor of Massachusetts.

Judge Dixon has written a letter accepting the Republican nomination for Governor of New Jersey, approving of the platform, and announcing his intention not to resign his judgeship previous to the election. Leon Abbett, the Democratic candidate, has also accepted. In his letter he favors "all measures which tend to improve the condition of the workingman" and the simplest and most economical form of local government.

The Republican State Convention of Maryland met on Thursday at Baltimore and nominated Hart B. Holton, of Baltimore, for Governor. There was no opposition. The ticket was completed with strong candidates. The platform favors protection, the extension of colored schools, and is constructed so as to please the Reform Democrats of Maryland.

A Judge of the Supreme Court and Regents of the University were nominated by the Nebraska Republicans on Wednesday. The platform favors a protective tariff and a State Railroad Commission.

The session of the Colored Men's Convention, at Louisville, was very disorderly on Wednesday. Motions to affirm the devotion of the colored men to the Republican party and to commend President Arthur's administration called out decided opposition. Late in the evening they adopted an address expressing gratitude for the laws of the United States in their favor, and asserting that they do not ask for any more class legislation. They call attention to employment, education, and sound moral training, as preëminent above all other questions that affect their race. They think the United States Government should reimburse the creditors of the Freedman's Savings Bank. They demand the abolition of the chain-gang convict system, and ask for free admission into the better class of trades and professions. Soon after, the Convention adjourned.

In the Connecticut town elections on Monday Republican gains were made.

The Secretary of the Treasury has rendered an important decision with regard to the construction of section 7 of the new Tariff Law, relating to packages and coverings of imported merchandise. He holds that the cost or value of the outside covering into which goods are finally put for land and ocean carriage, is not to be taken as part of or in addition to the value of the goods; nor is the value of the goods to be considered as enhanced by reason of that outside covering about them.

The new two cent postage rate throughout the country went into operation on Monday. In the city from 8 o'clock until noon the sales were made at the rate of about 100,000 stamps an hour, nine-tenths of the demand being for the two-cent stamps.

During the month of September the public debt of the United States was reduced $14,707,229 11.

The Second Comptroller of the Treasury has decided that officers who were restored to the army by Executive order are not entitled to be placed upon the retired list, and are not in the army. The decision will attract general attention on account of some of the notable persons who thus are deprived of a salary. Among these are Gen. Adam Badeau, Consul to Havana, and General Grant's staff officer and biographer; Gen. Daniel E. Sickles, once Minister to Spain; and Benjamin P. Runkle an intimate friend of President Hayes.

Mr. Miles Rock, Assistant Astronomer at the Naval Observatory in Washington, has been appointed Astronomer and Engineer Commissioner of the Guatemalan Government to locate the boundary between that country and Mexico. The boundary line is about 200 miles long, and one or two years will be required to finish the work.

Judge Samuel Hand, referee in the tax suit brought by the State of New York against the Western Union Telegraph Company, has rendered a decision in favor of the State for $178,397 26. This sum is for the taxes for 1881, but if the judgment is sustained the company will be liable for $139,200 more for 1882. The tax was levied upon the entire capital stock of the company, and not upon the portion invested in this State alone.

The Court of Appeals of this State on Tuesday rendered a decision in the Hatch-Williams case *versus* the Western Union Telegraph Company, reversing the decision of the General Term and affirming the judgment of the Special Term. The original suit in this litigation was brought by William S. Williams against the Western Union Telegraph Company to restrain the execution of the consolidation agreements entered into by the Atlantic and Pacific, American Union, and Western Union Telegraph Companies, and disputing the legality of the issue of $15,526,590 of stock by the Western Union Company to represent its surplus earnings since 1866. Judge Truax, of the Superior Court of this city, at Special Term decided in favor of the validity of this issue on June 20, 1881. On appeal to the General Term this decision was reversed, the Court there holding that the issue of shares of capital stock to the stockholders of the Western Union Telegraph Company was a violation of the statute law of the State, and the payment of dividends on such unlawfully issued stock was also illegal. The opinion of the Court of Appeals upholding the Special Term decision was unanimous, except that two of the judges, who were stockholders in the company, did not unite in it.

The suit brought by the assignee of the late Archbishop Purcell, in which he asked that over 200 pieces of Catholic church property in the diocese of Cincinnati be sold for the payment of the debts of Father Edward Purcell, which had been assumed by his brother, the Archbishop, was decided in the Hamilton County, Ohio, District Court on Monday. The decision is favorable to the churches, except in cases, which are comparatively few, where it can be shown that the property they hold was acquired either in whole or in part with money furnished by the Archbishop.

The One-Hundredth Convention of the Protestant Episcopal Diocese of New York met on Wednesday morning in St. Augustine's Chapel, this city, about 250 delegates being present. In the afternoon a letter was read from Bishop Horatio Potter, announcing his ill-health and requesting to be relieved from all official cares and duty. The Convention decided to elect an assistant bishop, and after several ballots Dr. Henry C. Potter, rector of Grace Church, in this city, was chosen. He is a nephew of Bishop Horatio Potter, and has signified his acceptance of the office.

The fiftieth anniversary of the formation of the New York City Anti-Slavery Society was celebrated by a meeting in the Broadway Tabernacle on Tuesday. Elizur Wright, one of the officers of the society elected fifty years ago, presided at the celebration. Albert O. Willcox read a history of the society. Remarks were made by C. W. Bowen, Oliver Johnson, the Rev. Edward Beecher, and others.

The Boston Base-ball Club has won the championship of the National League, and the Athletics of Philadelphia the championship of the American Association.

St. Julien, the great trotter, was defeated in three straight heats at Fleetwood Park on Saturday by Jay-Eye See, a five-year-old, which recently made a record of 2:10¾. More than 20,000 people were present.

During part of the week the Corean Embassy were in this city. They were received by the Mayor and tendered other courtesies. On Tuesday they visited the Departments in Washington.

John B. Carroll, formerly a clerk in the Bureau for the Collection of Assessments and of Arrears of Taxes and Assessments and of Water Rents in this city, has been placed under arrest as the principal culprit in extensive frauds in the Bureau. A deficiency in his accounts amounting to between $14,000 and $15,000, which has been discovered, embraces only three transactions of a kind which are said to have been numerous. The loss to the city will be smaller than the nominal amount, as part of the money will be recovered.

Mme. Christine Nilsson, the prima donna, arrived in this city from Europe on Tuesday to take part in the coming opera season at the Metropolitan Opera-house.

FOREIGN.

Several French newspapers conducted last week a campaign against King Alfonso of Spain

because they were convinced that henceforth he would be an ally of Germany, as he had accepted a Colonelcy of the Uhlans, and had appeared publicly in the uniform of his new regiment. The Madrid *La Epoca* was indignant concerning the articles, and denied that an alliance had been formed between Germany and Spain. Alfonso reached Paris on Saturday, and was met at the railway station by President Grévy and his Cabinet. Great crowds of workingmen were in the neighboring streets and hissed the King as he went by, crying: "Down with the Uhlan King!" The clamor continued all along the streets through which the King passed. He behaved with great discretion during the trying ordeal. President Grévy on Sunday visited the King at the Spanish Embassy, and the interview was of a most cordial character. M. Grévy tendered a sincere apology to the King for the behavior of the mob, in the name of the French people, who, he said, should not be confounded with the authors of the hostile manifestation. He begged King Alfonso to give to France a fresh proof of sympathy by accepting an invitation to a dinner at the Palace of the Elysée on Sunday evening, to be attended by all the Cabinet Ministers, when the true sentiments of France toward the King would be shown. The King accepted, and was present at the dinner from 7 to 11 P. M. He made an excellent impression by his conduct. President Grévy urged him to stay another day, but on Monday morning, at 8:45 o'clock, King Alfonso and his suite left Paris for Spain. There was no demonstration by the Parisians. Most of the French journals condemned the conduct of the mob, and the *Journal Officiel* on Monday published the fact that President Grévy had apologized. It is said that the King is perfectly satisfied with the good faith of Prime Minister Ferry. Alarming reports, however, prevailed in Paris on Monday that the Spanish Cabinet would demand a public apology from the French Government for the insults offered to King Alfonso, and that the German Government would make a diplomatic remonstrance against the indignities to which the Spanish King was subjected. In Madrid great indignation was exhibited. Bands of people paraded the streets on Sunday evening, insulting Frenchmen, and openly threatening the French Embassy. The police, however, prevented any violence from being perpetrated. The King's prestige at home has been increased by his dignified actions in Paris.

The Queen of Spain and family returned to Spain on Monday, and received a warm greeting from the populace. A meeting of the Dynastic Left was held on that day, and it was resolved to organize a great public demonstration in honor of the King on his arrival in Madrid. Many persons of note went to the frontier of Spain to greet the King. On the arrival of the train bearing his Majesty and suite at Irun, Spain, on Tuesday morning, a cordial and enthusiastic reception was given the party. In parting at the frontier with his French escort, the King bade the aide-de-camp of President Grévy convey his thanks to the President for the cordial welcome he had given him in Paris. It was denied on good authority that a treaty had been entered into between Spain and Germany. The King arrived in Madrid in the afternoon. The streets were crowded with enthusiastic people, who cheered him again and again. In the evening he gave a reception, attended by about thirty thousand people of all ranks.

There were rumors in Paris on Tuesday of a Cabinet crisis. It was said that a violent feud which exists between M. Wilson, son-in-law of President Grévy and member of the Chamber of Deputies, and Prime Minister Ferry had caused dissension between the President and M. Ferry in relation to King Alfonso's visit. M. Wilson was accused of having aided in the agitation against Alfonso. Later in the day it was announced that the Ministry would stand until the meeting of the Chambers.

Prime Minister Ferry, of France, had conferences on Wednesday and Thursday with the Marquis Tseng, the Chinese Ambassador. Advices from French sources, dated Hanoi, September 16, were received in Paris on Thursday, announcing that the Black Flags had abandoned Sontay and had retired to the left bank of the Red River. The French forces will undertake no offensive operations until after the arrival of reinforcements. It was again reported on Thursday that China's reply to the French memorandum had been received, and that it rejected several of the French proposals. China claims both banks of the Red River, placing the neutral zone southward. The French Government has declared that it cannot accept these terms, because by doing so it would lose all the fruits of its expedition, obtaining neither the delta, the Red River, the rich mining districts of Tonquin, nor a monopoly of the trade with the southwest provinces of China.

A French Cabinet Council on Saturday decided to convene the Chambers on October 23.

Emperor William, the German Princes, a great number of distinguished Germans, and 250,000 people were present on Friday at the ceremonies attending the unveiling of the great national monument on the Niederwald. The monument is 110 feet high. The statue of Germania which crowns it is about thirty-three feet in height. The total cost of the work was about $250,000. It was erected to commemorate the "unanimous and victorious rising of the German people and the reëstablishment of the German Empire—1870–1871." The Emperor delivered a short speech. At its conclusion, amid the roar of artillery, the tolling of bells, and the cheers of the people, the great blue silk cloth covering the statue dropped. The Crown Prince Frederick William, bending his knee, seized and kissed the Emperor's hand, whereupon the father and son embraced and kissed each other repeatedly. Emperor William then shook hands with General von Moltke. A dinner was given at the Royal Castle, in Wiesbaden, in the evening, in commemoration of the festival.

Bulgarian affairs again came into prominence during the week. It was announced from Constantinople on Thursday that the Porte was preparing a circular to the Powers, declaring that if Bulgaria lapsed into a state of anarchy, Turkey would exercise her right of suzerainty in that country for the restoration of order. It was also reported that Russia would issue a circular to the European Powers taking exception to the recent changes in the Government of Bulgaria, by which Prince Alexander removed the Russian Ministers, Generals Sobolefl and Kaulbars, and placed M. Zankoff, a Liberal, at the head of his Cabinet.

M. Bratiano, Prime Minister of Rumania, held a conference with the Emperor Francis Joseph, after having repeated interviews with Count Kálnoky, the Austro-Hungarian Minister of Foreign Affairs, and Prince Henry VII., of Reuss, the German Ambassador at Vienna. It is generally considered that Rumania's entrance into the Austro-German alliance has been effected.

The Croatian members of the Hungarian Diet have declared that they will not take their seats in that body until the constitutional administration of the government is reinstated in Croatia.

Anti-Jewish excesses were reported on Wednesday in a district of West Hungary. Several arrests were made.

A papal decree regulating procedure before the civil tribunals of the Vatican was published in Rome on Tuesday. It ignores Italian law, and ordains that all contracts between any portion of the Pope's household and parties outside shall be regulated solely by Pontifical law.

The official report of the fatalities consequent upon the late earthquake on the island of Ischia asserts that 1,990 persons were killed and 374 injured.

O'Donnell was brought again before the Bow Street Police Court in London on Friday, when his examination was resumed. Carey's son and widow testified. The former thought that O'Donnell had said he was sent to do the murder, but on cross-examination expressed some doubt as to what the assassin had said. Mrs. Carey affirmed positively that O'Donnell said after the shooting of her husband: "Don't blame me; I was sent to do it." O'Donnell made no defence, and he was committed for trial at the next session of the Central Criminal Court. Judge William Fullerton and Gen. Roger A. Pryor, of this city, have been retained as the American counsel of the prisoner.

Five townships in Tipperary County, Ireland, have been proclaimed by the Government on account of outrages perpetrated there.

At Dungannon, Ireland, on Wednesday, Thomas Power O'Connor, member of Parliament for Galway, and Mr. Small, member of Parliament for Wexford, visited Unchnaclay Market for the purpose of holding a political meeting. They were unable to speak, however, as a body of Orangemen took possession of the place and compelled them to remain within doors. An Orange meeting was held on Thursday. The police prevented a collision with the Irish Nationalists.

A report was circulated in London on Thursday night that Mr. Parnell had been shot. It had no foundation in fact.

The Convention of the Irish National League of Great Britain held a session at Leeds on Saturday morning. The meeting was held with closed doors. Resolutions were unanimously passed expressing confidence in the Irish leaders, pledging support to the Executive and to a policy in the local Parliamentary elections best calculated to promote the Irish cause, and congratulating Ulster on its campaign against landlordism and bigotry. A resolution was also unanimously adopted denouncing mob violence and reprobating journals hounding Protestants to outrages.

Mr. Bradlaugh has addressed a letter to Sir Stafford Northcote, in which he declares that he will again demand his seat in the House of Commons on the reassembling of Parliament.

Fifteen thousand steel and iron workers employed in the counties of Glamorganshire, Wales, and Monmouthshire, Eng., have struck against a reduction of 10 per cent. in their wages. Employers urge that, in view of English and American competition, they must either close their works or reduce wages.

The British Association for the Advancement of Science has decided to invite the American Society for the Advancement of Science to become honorary members of the Association during its visit to Montreal in 1884.

The steamer *Rotterdam*, of the Netherland-American Line, was stranded at noon on Thursday on the coast of Zealand. Her passengers were safely landed. On Friday she split in halves.

Notwithstanding the large reduction made in customs and excise duties at the last session of the Canadian Parliament, the surplus in the revenue of the Dominion over expenditures was larger during the fiscal year ending June 30 last than ever before in Canada, being about $7,000,000.

The jury in the case of Tide-waiter Logan, charged with having originated the recent riots in Canton, China, on Friday returned a verdict of manslaughter. He was sentenced to seven years' penal servitude. There was considerable dissatisfaction with the sentence on the part of the Chinese. Business is entirely suspended in Canton.

BUSINESS FAILURES.

THE reports of mercantile failures for the last quarter foot up 1,803 in number, with liabilities of $53,072,884, as compared with 1,300 failures and $19,000,000 liabilities during the corresponding period last year. Since January 1, 1883, the failures have been 6,440 in number, with liabilities amounting to $118,261,918, against 4,897 failures and $69,000,000 liabilities during the corresponding nine months of 1882. It is impossible to disguise or belittle these facts. Although we have had nothing resembling a panic in the commercial world, we have had a severe reaction in business, commencing with midsummer, 1881. The shrinkage in prices has been partly, but only partly, disclosed in the depreciation of railway securities. The same shrinkage has been going on in mercantile, manufacturing, and mining industry. It behooves us to look for its cause, if it can be found.

It is an old truism that agriculture is the foundation of all industry. A moment's reflection will show that there can be no progress without agricultural progress, because human beings cannot live without food. There can be no advance in the number of population—therefore no addition to the numbers employed in non-agricultural pursuits—without corresponding increase in farms and farm products. Great Britain, with her limited area and dense population and great and growing manufacturing power, seems to contradict this doctrine, but really commerce brings Great Britain into the same relations with the wheat fields of Western America that contiguity brings us. She is a partaker with us in the proceeds of every harvest. No adjustment of tariff duties, so long as we have an exportable surplus, can keep her out, or prevent her from getting a share in the year's yield corresponding to its quantity and to her commercial importance in the world. The same may be said of every country with which we have any trade, direct or indirect. Great Britain has the advantage over us in other than agricultural industry that, having access through freedom of trade to all the wheat fields in the world, she is less subject to the vicissitudes of seasons than we are, and has a correspondingly larger market for her own products—that is, more room for growth in all non-agricultural employments.

The question which we are considering, however, is not one concerning tariff restrictions. We are interested to know why business failures have increased to the extent shown by the returns of the last quarter of last year and of the three-quarters of the present year. "Overtrading" is the usual explanation given for every business crisis, great or small. The solution may be, and probably is, the correct one, but overtrading does not define itself, and it conveys a very indistinct notion of the causes by which merchants and manufacturers are brought low. How is anybody to know that he is overtrading, so that he may stop in time? What signal should be given so that all men may know and understand that it is time to take in sail?

If our premises are correct, the test and evidence of a sound condition of trade is to be sought in the growth and conditions of agricultural progress—our own agricultural progress exclusively, so long as we are hemmed in by protective tariffs. If for any reason the development of trade and manufactures outruns by ever so little the development of agriculture, the excess will return to stifle the traders and manufacturers. It might be supposed that as commerce of every sort is conditioned upon agriculture, the former could not possibly outrun the latter. It would be well for the commercial world if it were so. It would be well if Providence had drawn a hard and fast line beyond which trade could not advance in any given period. But as agriculture itself is not a fixed quantity, but varies in its results from year to year, much latitude is given to other vocations to expand in good years without the corresponding power to contract in bad ones. Expansion implies the investment of capital and the creation of liabilities. These, when once brought into existence, cannot be curtailed at pleasure. Curtailed they must be, if they stand in unequal relation to the state of agricultural production at a given time, but the shortening process will be forced, and not voluntary. It will find its expression in business failures. It would be safe to say *à priori* that any marked increase in the number of failures must point to a present deficiency of the crops, as compared with some former period when the expansion of general trade took place.

What are the facts? We quoted statistics last week showing that the increase in acreage under cultivation in this country had been at the rate of only 2 per cent. per annum since the year 1879. The increase of acreage, however, is only one factor in the problem. The increase of bushels is the really important one. Measured by this test it will be difficult, we think, to show that there has been any increase at all in the amount of cereals grown in this country since the years 1879 and 1880. Those were exceptionally good ones, and trade received a tremendous impulse from the wealth poured out by the favoring conditions of soil and climate. The pace could not be sustained. We have had no bad years, save in the sense that any year which yields less than the maximum is a bad one for the man who has laid his plans and incurred his liabilities in the good years. There are no statistics at hand showing what has been the growth of non-agricultural industries since the census year, except in railway construction. This has been at the rate of 9 per cent. per annum, or 45 per cent. in five years. The shrinkage in the quotations of railway stocks and bonds since midsummer, 1881, has been estimated by good judges at not less than $1,000,000,000. This sum is equal to the cost of 40,000 miles of railway at $25,000 per mile, or to 50,000 miles at $20,000 per mile. The shrinkage in values has been about equal to the increase of mileage, from which it would be reasonable to infer that the equilibrium between railways and agriculture (as regards the prices of securities) has been restored, and that no further depreciation in the aggregate need be looked for. Probably all the "water" has been squeezed out of the new railways, and a large amount of the sugar likewise. At all events, small encouragement is left to new railway projects for some years to come. The competition of capital, which grows fiercer as the world grows older, and of which the present "war of rates" among the newspapers is the latest outcome, must take some other direction. Railway construction and the industries immediately dependent upon it must call a halt till agriculture overtakes the existing mileage and gives the signal for a new start.

Nobody can say what the crop of failures in the next few months will bring forth. The testimony of good judges concurs in saying that mercantile indebtedness is on a low scale, that business is done on shorter time than ever before, and that the ratio between capital and liabilities is more favorable to sound conditions of trade than at any former period. If these are the facts of the situation, we may confidently expect a reduction in the number of failures for the next quarter; but we can only wait and see.

INTERNATIONAL LAW-MAKING.

THE Institute of International Law, which has now been in active existence some ten years, while it has enriched the literature of international law with many valuable discussions and suggestions, has not thus far accomplished much of the work which its founders expected of it. The principal aim of Lieber, Rolin-Jacquemyns, and Bluntschli in founding the society was to "ascertain the juridical opinion of the civilized world, to give to that opinion an expression clear enough and precise enough to fit it for acceptance by the several states, as the rule of their external relations; and thus to prepare, by gradual stages, for that codification of international law at present so persistently demanded." It was under the idea that a code was to be the next step in international law, and that the proper codifiers would be the writers who had turned their attention and devoted their lives to this subject, and that the decisions of such codifiers would be gladly accepted by the several states, that the Institute was founded. It cannot be said that these ideas have been justified by the event. Although it is a fairly representative body, its membership covering a dozen or more of the leading countries of the world, and although it has faithfully taken up and discussed most of the important international questions of the day, the countries interested have shown very little disposition to adopt its solutions, and still less desire for a codification of them.

Being in a certain sense a product of the stimulus given to the interest in arbitration by the *Alabama* convention, the society early took up the question of the relations of neutrals and belligerents, and produced a revised edition of the "Three Rules" governing them, laid down in the Treaty of Washington. It will be remembered that these rules were adopted by the United States and Great Britain for their guidance in future, and both countries agreed to invite other Powers to accede to them. But so dissatisfied were the English with the interpretation of the rules at Geneva, that no such action has ever been taken by Great Britain; and we have, as Dr.

Woolsey points out in his treatise on international law, the curious result of the two Governments differing as to the meaning of the rules, and yet bound to observe them, and to get other countries to do so. "We must admit," he says, as far as future difficulties are concerned, "that any other board of arbitrators would not be compelled to follow the interpretation of the tribunal at Geneva." The revised three rules of the Institute have not solved these difficulties.

The Institute has settled as far as it can one question of maritime law, by declaring the inviolability of private property of an enemy under a neutral flag to be part of the "positive law of nations." This is a mere repetition of one of the articles of the Declaration of Paris, adopted in 1856, which has already been acceded to by almost every European Power, and to which the United States would be a party had it not been for the unsettled dispute about privateering. The possibility of making an international prize court and getting a prize code adopted is a question which has occupied a great deal of the time and attention of the society. It has been at work upon this for some six years. The object is to protect private property at sea during war as far as possible. The Continental members of the Institute are in favor of this, but the English members are violently opposed to it, and the United States has not been heard from. The neutralization of the Suez Canal has had a good deal of study at the hands of the Institute, but the only result has been the expression of a hope by that body that damage done to it by a ship of war will be repaired by the state to which it belongs.

Thus, so far as the great questions of modern international law which relate to the rights of neutrals and belligerents, and the protection of private property in time of war, are concerned, they have been left where the Institute found them. The reason is not far to seek. With regard to the United States, although under ordinary circumstances it might be counted on to join in any movement for the amelioration of international law and the protection of neutral and private rights, its recent attitude as a belligerent has obscured its own diplomatic traditions, and the "three rules" of the *Alabama* treaty place it in a position in which it is as difficult to advance as to retreat. The same thing, to a certain extent, may be said of England. The great nations of the Continent hesitate to do anything, because they may at any moment be engaged in war on a great scale, and no nation is ready in advance to cripple itself by a serious act of self-abnegation. It is true enough that England did in advance of the Crimean war waive the right of seizing enemy's property on board neutral vessels, but this was in the interest of neutrals with whom she desired to be on friendly terms, quite as much as in that of international altruism.

Speaking generally, the period in which we live is, as regards nations, one of armed legal neutrality. Since the United States refused to abolish privateering, no important advance in securing the right of neutrals has been made. No maritime Power seems willing to abandon the old right of dealing its enemy a crushing blow through its commerce, any more than any great nation is ready to abandon its time-honored privilege of levying tribute, or, as it is now prettily called, making requisitions, on land. Such a time is not propitious for the adoption of a code which would only have the effect of handicapping somebody—no one knows exactly whom—in future troubles; and the jurist consequently finds that such work as that undertaken by the Institute is more difficult and discouraging than it might have been a generation ago.

BENEFITS OF TRADE UNIONS.

Some remarkable statistics of the strength and work of the trade unions of England were given by Mr. Frederic Harrison recently in an address before a trade-union congress in London. The most common idea of a trade union is that it is an organization of workmen designed chiefly to give them support in strikes against their employers. Mr. Harrison shows that, so far as English unions are concerned, this is an error. They have more than doubled their numbers and incomes during the past sixteen years. Five of the principal unions, which did not in 1867 number in all 60,000 members, now have an aggregate membership of 125,000. During the same period they have doubled their incomes and their reserve funds. Trade in England suffered severe depression during these years, and the strain upon the unions was very great. Seven of them spent within six years nearly $10,000,000 in support of men out of work and for other charitable purposes, drawing upon their reserve funds for nearly $1,000,000, yet now they have an aggregate balance on hand of $1,800,000. The Engineers' Union alone paid $750,000 to men out of work in the year 1879, and during five years the same society paid for the same object $1,935,000. During the hard times in 1879 more than 46,000 persons were wholly supported by the funds of five unions, which in the same year spent $5,000,000 in aiding the sick, paying insurance on tools and lives, and for other purposes. Out of the total expenditure of $10,000,000 in six years, only $800,000 was spent in settling strikes and trade disputes of all kinds; and during the last year, when their aggregate income was $1,650,000, and their aggregate resources $3,450,000, they spent only $25,000 in settling disputes, or less than 1 per cent. of their resources.

These figures show that the unions have grown into great provident societies, which are as great a benefit to the state as they are to the workmen. No one can dispute Mr. Harrison's assertion that it is a vulgar error to say that organizations which devote 99 per cent. of their resources to charitable purposes and only 1 per cent. to the settlement of disputes, exist mainly for the purpose of encouraging and sustaining quarrels between the laborers and their employers. Mr. Harrison is well known in England as the foremost champion of the trade unions outside the ranks of the workmen. He began his defence of them years ago, when public sentiment, as it was manifested in the press, was bitterly opposed to them. He has maintained his position in the face of all obstacles, and has the satisfaction of seeing all the ablest journals of England come over one after another to his side. The *Spectator* not only cites his figures as proof that unionism is spreading, but shows from them that "it is a good thing that it should spread." The *Pall Mall Gazette* says the old doctrine that no bargaining on the part of the workmen can have any effect in making their wages higher "is now for all practical purposes as dead as Queen Anne," and adds: "Whatever new dangers the development of trade unionism may yet bring with it, the movement has at least opened out to us a new hope. It has given men a confidence, which theorists were wont to discourage, in the power of the workmen to raise their condition by combination, and a new belief in the truly social doctrine that the advancement of one class, however it may at first seem to threaten others, must conduce in the long run to the advantage of all."

One of the most important things shown by Mr. Harrison's figures is that strikes are growing less frequent every year. As the unions increase in power and wealth the number of disputes between employers and laborers diminishes. The reasons for this are not far to seek. The strength of the unions not only makes employers more cautious about provoking them, but has a restraining influence upon the unions themselves. They have more to risk, as the *Spectator* well points out, and are in consequence less inclined to risk it. Their large reserve fund represents the labor and self-denial of many years and many men, and they will hesitate long before risking its sacrifice in what may be an unsuccessful strike. This is in accordance with an old and familiar law. The man who has nothing is always more ready to accept risks than the man who by self-denial has saved something. By gradual development the trade unions of England have become great mutual benefit associations, which, by improving the condition of their members, have increased the proficiency of their labor, and thus directly enhanced its value to their employers.

The trade unions of the United States have little in common with those of England. Here they are chiefly combinations for the purpose of affecting wages and assisting in strikes, and have few of the beneficent objects which are so commendable in the English societies. Yet it is a fact which we think few persons will dispute, that strikes are becoming less frequent in this country every year. The failure of the iron-workers' strike in Pennsylvania and the West last year, and of the telegraph operators this year, has undoubtedly had much to do with making the workmen more reasonable in their demands. By enlarging the scope of their organizations and modelling them after the English pattern, the American unionists would be certain to achieve the same happy results which have been obtained in England.

AT FROHSDORF AND GOERZ.

PARIS, September 14.

After the war of 1870, whenever M. Thiers, who wished to establish a republican form of government, found himself embarrassed by the opposition of the Constituant Assembly, he would say it was impossible to make a monarchy, because there were three monarchical parties—

meaning the Bonapartists, the Legitimists, and the Orleanists. The Bonapartists were not very powerful immediately after Sedan and the disastrous events of the invasion; the Legitimists and the Orleanists were divided by the memories of 1830, which were dying out. The Comte de Paris, led by patriotic motives, went to Frohsdorf, and told the Comte de Chambord that if ever France resolved to return to the monarchical form of government, he would not be his rival to the throne. This declaration was of great importance, since it satisfied the Legitimists, while it reserved the sovereign rights of the French nation. The Comte de Paris did not assert the principle of the divine right: he merely said that if France again became a monarchy, the monarch ought to be the Comte de Chambord, the then head of the ancient House of France.

When this first interview at Frohsdorf took place, in 1873, it was under peculiar circumstances. Very few people in France were aware of the intended visit; the secret was well kept. The Comte de Paris arrived at Vienna very unexpectedly, and the little court of the Comte de Chambord was taken by surprise. Still, some opposition was at first made to the visit, and it can hardly be doubted, in the light of recent events, that the opposition did not come solely from the followers of the Comte de Chambord, but that it came also from the Comtesse de Chambord. She was the daughter of that Duke of Modena who would never recognize Louis Philippe as King from 1830 to 1848; she had been brought up in sentiments which were hostile not only to the House of Orleans, but to the French nation. Married to the Comte de Chambord, she feared the throne of France more than she could desire it; she looked with alarm on the nation which represented the Revolution. There was nothing in the history of Marie Antoinette, of Louis XVI., of Charles X., of the Duc de Berri, of the Duchesse de Berri, which tended to reconcile her with France. Many a foreign princess in old times, married to a French prince, had been obliged to go to war with her own people and her own relations; but these princesses had become queens, and had the duties and responsibilities of the royal office. The Comtesse de Chambord had married her husband in exile; she had never been with him in France; she had never had a court; she had never become familiar with the French nation. The only Frenchmen she saw were those devoted gentlemen who came in turn to discharge some voluntary offices near the Comte de Chambord.

The Comte de Chambord, while he lived in the greatest harmony with a wife who was absolutely devoted to him, saw things from a higher point of view. It is idle to speak of him now, as some people do, as of a man who had been a real king, and who always fulfilled all his royal duties; but it is true that he had a high notion of his representative character, and a sort of dignity which proceeded from it. He perceived at once the importance of a political reconciliation with the Comte de Paris; and when, after a short negotiation, he received him, he never made an allusion to the past, to so many differences, to all the memories which had long stood between the eldest and the youngest branches of the House of Bourbon. He received the Comte de Paris in the most friendly manner, and was impressed by the frankness, the honest expression, the seriousness of the grandson of Louis Philippe. He presented him to the Comtesse de Chambord, who asked the Comte de Paris to send her, as soon as possible, photographs of the Comtesse de Paris and of all his children.

This interview of 1873 led politically to no result, as the Comte de Chambord issued some time afterward various manifestoes, under the form of letters, which made the reëstablishment of a monarchical form of government impossible. But the Comte de Paris, having reconciled himself publicly with the head of the Bourbons, continued to hold relations with him, which ceased, however, to have any political character. He informed him of all the family events which could have any interest for him. When it became known that the Comte de Chambord was dangerously ill the Comte de Paris resolved to go to Frohsdorf. The day before he left Paris he saw only some intimate friends, whom he informed of his resolution. He knew that it was not without danger. At the beginning of this year some republicans, without any provocation on his part, or on the part of any member of his family, had proposed to banish all the members of the ancient royal family. This proposition, which nothing could justify, had been rejected by the Senate; still it might be that he would find the doors of France shut on him on his return. He felt, however, having solemnly visited the head of his family in 1873, that he could not let him die without seeing him; it was his duty to pay this homage to a prince who was the last of the eldest branch of his house. The visit took place, and the Comte de Chambord, already very ill, had much pleasure in seeing the Comte de Paris. He was moved by this mark of regard; he received him with much emotion. It was remarked, however, that this time the Comtesse de Chambord did not see the visitor, nor his uncles who accompanied him. She excused herself on the plea of ill-health and fatigue.

The Comte de Chambord seemed to be better some time after the visit, and the Comte de Paris returned to France. He had not been there long when the news of the death of the Comte de Chambord reached France. Not a moment was lost. The Comte de Paris immediately returned to Vienna. All his uncles followed him. His brother, the Duc de Chartres, who was in Norway, arrived directly. The whole Orleans family found itself united in the Imperial Hotel at Vienna. A large number of Frenchmen who wished to pay a last homage to the Comte de Chambord proceeded to the Austrian capital. On the 18th of August the Princes arrived at Frohsdorf. The Comte de Paris was this time accompanied by his young son, the Duc d'Orléans. The Comte de Paris, assuming the responsibilities which now fell on him, sent telegrams to all the courts to inform them of the death of his cousin. These telegrams were signed Philippe, Comte de Paris. Hitherto he had always signed his letters and telegrams Louis Philippe d'Orléans; but it has invariably been the custom in the royal family, that when the eldest branch of the house became extinct, the head of the branch which followed dropped his family name, and only kept his Christian name. The name of Comte de Paris is merely a title, like the name of Comte de Chambord; the Comte de Chambord signed simply Henri, the Comte de Paris signs now Philippe. In so doing he gives satisfaction to those who see in him the representative of the old royal House of France. Such also was the position which the Comte de Paris was to take in the funeral ceremony of the Comte de Chambord. He had become, in the eyes of all the monarchists, the successor of the Comte de Chambord, and nobody could dispute him the preëminence. Great difficulties at once arose, however, because the Comtesse de Chambord wished to give the funeral a mere family character. She asked the first place for her nephews, the Duke of Parma, the Comte de Bardi; and even for Don Carlos, the Duke of Madrid, who is only her nephew by alliance. The Comte de Paris would only have ranked behind these three Princes; it was singular to claim for the heads of the Parmesan and Spanish branches the right to conduct the funeral of a prince who, during all his lifetime, had asserted his position of chief of all the Bourbon family with so much energy.

The negotiations lasted during four days. The Comtesse de Chambord was never willing to see in person those who conducted the negotiation in the name of the French princes. The Comte de Paris meanwhile received the visit of the Emperor of Austria, as if the Emperor by this demonstration wished to show that he looked upon him as the head of the Bourbon family. On the 1st of September there was a private ceremony at Frohsdorf, in the house of the Comtesse de Chambord. The Comte de Paris would make no conditions: he was willing to accept the second place, and to put himself behind the Duke of Parma. The small chapel at Frohsdorf witnessed a curious spectacle: the whole house of France and the whole house of Austria uniting in the same prayers over the descendant of Henri IV. and of Louis XIV. The Spanish princes did not appear. The ceremony at Görz could not have the same private character. All the French royalists were to follow the procession to Görz; they would not endure to see the Comte de Paris following Don Carlos. But at the last moment the Comtesse de Chambord sent a written memorandum, in which she said that, in accordance with the intentions of the deceased, she desired that "each prince should be placed at Görz according to the degree of relationship." The question of nationality was to be made secondary. It could not so appear to the Comte de Paris: he did not look upon the funeral of the Comte de Chambord as an ordinary funeral; he hesitated a moment, and announced that he would not go to Görz. This determination was taken on the evening of the 1st of September, and the next morning at 8 o'clock the Emperor of Austria announced that he had modified the dispositions which he had taken in order to be represented at the funeral at Görz. He had intended first to send his own brother, Louis Victor; in the absence of the Comte de Paris, he contented himself with sending his grand equerry, Prince of Tour and Taxis. The ex-King of Naples, who, as representative of the Bourbons of Naples, a branch of the French Bourbons, had accepted the precedence of the Comte de Paris, announced that he could not accept the precedence of the Bourbons of Parma, Modena, and Spain, and therefore he did not go to Görz. The ceremony there was in consequence deprived of the presence of the Bourbons of France and of Naples.

These questions are not mere questions of royal etiquette. The French Legitimists expected to follow the Comte de Paris at Görz as the representative of the monarchical principle, and as the only representative of this principle for France. As I said in my last letter, the existing constitutional laws of France have a revision clause, which is extremely comprehensive. A majority of one vote in both Chambers can convert the two Chambers into a constituant congress, and this congress has a right to alter the form of government. The fact, therefore, that all the old differences between the Legitimists and the Orleanists have ceased is significant. The Comte de Paris is the only possible king of France, and the most ardent Legitimists are bound to be loyal to a prince who by education and by tradition represents the best part of what we call the principles of 1789. It is undeniable that the force of heredity is doubled in him by the character of a prince who is in sympathy with modern ideas. It must not, however, be imagined that the Comte de Paris will be an agitator, and take the position

of an unruly and ambitious pretender. He expects nothing except from the free will of France, if the country should find its present situation among the monarchies of Europe too dangerous or too difficult. It would be very hard to foresee under what circumstances a pacific and so to speak legal change of government might take place. It would be almost a new fact in history, as generally such changes arise only from sedition, civil wars, or the dictation of a conqueror.

Notes.

FROM the last two numbers of the *Publishers' Weekly* we select the following fall announcements as not yet having been made in these columns. *A. C. Armstrong & Son* : A translation of Prof. J. J. Rein's 'Japan,' with its fine illustrations and maps. *Cassell & Co.*: 'European Butterflies,' by W. F. Kirby, of the British Museum; 'Some Modern Artists and their Work,' with portraits and specimen pictures—all English, except Boughton; and 'Prometheus Unbound,' with twelve outline illustrations by Sir J. Noel Paton. *The Century Co.*: 'Sport with Gun and Rod in American Woods and Waters,' by Prof. Alfred M. Mayer, of the Stevens Institute. *Dodd, Mead & Co.*: 'A Score of Etchings,' by Haden, Herkomer, Hamerton, Brunet-Debaines, etc.; 'A History of Sculpture,' by Lucy M. Mitchell, profusely illustrated; a revised edition, brought down to date, and printed from new plates, of Bryan's 'Dictionary of Painters, Engravers, and Sculptors'; 'Stone Sculptures of Cópan and Quirigua,' from the German of Julius Schmidt, by A. D. Savage; 'The Northwest Coast of America,' also from the German, and ethnologically illustrated from the collections at Berlin; 'The Basé Country,' travels in Sudan, by Frank James; a new edition of Curzon's 'Monasteries in the Levant'; Prof. Alfred J. Church's 'Stories from Herodotus,' and 'Stories from Livy'; and 'The Chronicle of the Cid,' edited by Richard Markham, with fifty designs expressly made for this work. *Harper & Bros.* : 'Autobiography of Anthony Trollope'; 'Life of Bulwer Lytton,' by his son; and 'Folk-Lore of Shakspere,' by the Rev. T. F. Thiselton Dyer. *Macmillan & Co.*: 'Egypt and the Egyptian Question,' by D. Mackenzie Wallace; 'Notes on the Caucasus'; 'Travels in New Zealand,' by the Rev. W. S. Green; 'Samoa a Hundred Years Ago and Long Before,' by Dr. George Turner; 'Camping among the Cannibals,' by Alfred H. Johnston; 'Isaiah of Jerusalem,' by Matthew Arnold; and 'Investigations in Currency and Finance,' by the late Prof. W. S. Jevons. *G. P. Putnam's Sons*: Edward Armitage's 'Lectures on Painting'; and 'The Secret Service of the Confederate States in Europe; or, How the Confederate Cruisers were Equipped,' by James D. Bullock, late naval representative in Europe of the Confederacy. *R. Worthington:* Ihne's 'History of Rome'; and 'Types of Spanish Story, or the Manners and Customs of Old Castile,' by R. De Los Rios, with thirty-six proof etchings on Japanese paper. *S. E. Cassino & Co.*, Boston: A cheap edition of Sir J. Gardner Wilkinson's 'Manners and Customs of the Ancient Egyptians'; and Fergusson's 'History of Architecture.' *Estes & Lauriat:* Gray's 'Elegy,' with original designs by Birket Foster, W. L. Shepard, W. L. Taylor, and Francis Müller. (This poem, by the way, seems an especial favorite this year with our holiday-book makers; witness the "Artists' Edition" promised by J.B. Lippincott & Co., with the aid of Richards, W.H. Gibson, Thomas Hovenden, A. B. Frost, and others, and the "Harry Fenn Edition," in preparation by Roberts Brothers, that artist being the sole illustrator.) *Houghton, Mifflin & Co.*: 'History of Georgia, from its Settlement to the End of the Revolution,' by Colonel Charles C. Jones. *Little, Brown & Co.*: 'Addresses and Orations,' by the late ex-Gov. Alexander H. Bullock: and 'Shakspere as a Lawyer,' by F. F. Heard. *D. Lothrop & Co.*: A 'Life of Oliver Wendell Holmes,' by E. E. Brown; a 'History of the American People,' by Arthur Gilman; 'American Exploration in the Ice-Zones, compiled by Prof. J. E. Nourse; and 'Through Spain on a Donkey-back.' *Roberts Brothers*: 'New England Legends and Folk-Lore,' by Samuel Adams Drake; 'The Expansion of England,' by Prof. J. R. Seeley; 'In Nazareth Town, and Other Poems,' by the Rev. John W. Chadwick; 'Sarah and Angelina Grimké,' by Mrs. C. H. Birney (in the "Famous Women Series"); a 'Short History of the City of Philadelphia,' by Susan Coolidge; and a new edition of 'Robinson Crusoe,' with Stothard's illustrations. (With this last may be mentioned the edition to be issued by John E. Potter & Co., Philadelphia, with Ernest Griset's illustrations.) *J. B. Lippincott & Co.*: 'Palgrave's Golden Treasury of Songs and Lyrics,' continued by selections from recent and living English poets, under the editorship of John Foster Kirk. *John E. Potter & Co.*: A reprint of Whitehead's 'Life of Wesley'; a 'History of the Methodist Episcopal Church in the United States,' by the Rev. Douglass Garrie; 'Lorenzo Dow: His Life, Travels, Labors, and Writings,' by Peggy Dow; and Kitto's 'History of Palestine from the Patriarchal Age to the Present Time.' *J. A. & R. A. Reid*, Providence: 'Picturesque Washington,' by Joseph West Moore. *Townsend McCoun*, Chicago: 'A Dictionary of Music and Musicians,' by W. S. B. Mathews; and a new edition of the same author's 'How to Understand Music.'

Peter Paul & Bro., Buffalo, N. Y., publish next month 'The Poems and Swedish Translations of Frederick Peterson, M.D.,' which include a version of Tegnér's 'Axel.'

The September number of Mr. Foster's *Monthly Reference Lists* (F. Leypoldt) guides the student of the Treaty of Peace of September 3, 1783, or of Social Life in New England in the seventeenth century.

In the September number of the *American Journal of Science* is an article by Messrs. Hague and Iddings, of the U. S. Geological Survey, on the volcanoes of Northern California, Oregon and Washington Territory, to which the attention now called to the great Northwest by the opening of the Northern Pacific Railroad lends additional interest. In the latter part of the summer of 1870 members of the geological exploration of the fortieth parallel commenced a survey of these volcanoes, with a view of preparing a series of monographs on the phenomena presented by them, accompanied by accurate and detailed maps. Mr. Clarence King, who was in charge of this exploration, examined Lassen's Peak and Mt. Shasta in California, Mr. Arnold Hague Mt. Hood in Oregon, and Mr. S. F. Emmons Mt. Rainier in Washington Territory. Owing to the late season at which it was commenced, their work was only partially completed, and as the authorities at Washington did not approve of its continuation another season, none of the scientific results obtained, except the fact that actual glaciers were discovered on all the peaks except Lassen's, have ever been published. Messrs. Hague and Iddings have recently been engaged in making a thorough microscopical study of the specimens from these four peaks, the results of which, together with a short description of their physical characteristics, are embodied in the above article. The composition of the lavas in these volcanoes, which are mainly andesitic, are shown to be remarkably uniform, even the so-called granitic rhyolite from Lassen's Peak, which had been considered by Richthofen a type of his nevadite, being found, in the light of recent advances in lithological study, to be, like the other rocks, an andesite.

The two handsome volumes of the *Wheelman* testify, both externally and intrinsically, to the social standing of the devotees of bicycling in this country in a manner worth remarking. No other "rage" that we remember has produced a periodical so excellent in tone, taste, or literary standards, or so apparently prosperous. All this the Boston *Wheelman* has been "from the start." Book notices form a regular feature of each number.

The names given to translations into English of foreign books are a source of some confusion to the reading public. Frequently there is no relation between the name in the original and the name given to the translation. A worse trouble arises, however, when two or more translations appear of the same book with different titles. In 1879 a translation of E. Bürstenbinder's novel 'Um hohen Preis' was published in Boston with the title 'At a High Price'; a few months ago a New York publisher issued a new translation of the same book with the title 'No Surrender.' The same author's 'Vineta,' published in Boston in 1877 with the same title as the original German, now appears in a new translation issued in New York with the title 'Under a Cloud.' No doubt many persons bought these new translations, thinking they were new books and not old friends with new names.

Eminently gratifying is the evidence of an attempt at the South to stem the flood of obscene periodicals that comes from the North. A Richmond Grand Jury has indicted the newsdealers of that city for selling these prints, and the newsdealers have not awaited trial and conviction, but have agreed to discontinue the miserable traffic at once. Within a few years—and it is only within a few years—these papers have been excluded from certain Northern railway lines, at least as regards sale in the cars. The great news companies have been highly culpable in consenting to deal in them. The eye of the passer-by is offended, as the morals of the young are corrupted, by pictures whose exposure it ought to be a common police duty to suppress.

Mr. Henry Brooks, of Boston, has prepared a useful series of specimens of the wood of several of the important timber trees of the Eastern States for the use of teachers and students of natural history. Each species is represented by three thin transparent sections of wood framed together and cut in the direction of the layers of annual growth, at right angles with the grain, and in a manner to show a cross-section of the trunk. The specimens mounted between thin sheets of mica permit a satisfactory examination of the position and size of the different ducts, cells, medullary rays, etc., besides showing admirably the color and general character of the different woods. Architects and builders, therefore, as well as teachers, will find Mr. Brooks's contribution to a knowledge of our trees of considerable practical value. Complete sets representing seventeen species, or single sheets, can, we believe, be obtained by addressing Mr. Charles W. Spurr, 35 Bedford Street, Boston.

M. de Saint-Heraye has a long paper, and an entertaining one, in *Le Livre* for September, on the "Literature of the Cholera," and contrives to overlook Sue's 'Wandering Jew.' M. Émile Colombey endeavors to rectify the tradition concerning Mirabeau's apostrophe to the Marquis de Dreux-Brézé—"Allez dire à votre maître

que nous sommes ici par la volonté du peuple," etc. A copy of the Bodleian portrait of Mary Stuart accompanies an account, with specimens, of her French versification.

Brentano, Union Square, has received 'Paris—Ischia,' the production of the committee of the Paris press for the relief of the recent sufferers from earthquake. The first literary contribution is by Renan, who tells of his happy sojourns on the island, during which he composed his 'Souvenirs.' Rochefort has a clever reflection on the disadvantage of marble palaces in an earthquake country, and the consequent gain to France in sober living if a volcano existed on her soil, and compelled people to live under thatched roofs. The best of the illustrations are those not evoked by or symbolical of the catastrophe.

Mr. F. Gutekunst, Philadelphia, sends us two panel photographs of Monsignor Capel, of large size and beautiful execution, and, as we can testify, excellent likenesses of the celebrity of the hour.

The *Revue Critique* quotes from a discourse by M. Person, of the Lycée Condorcet, an enumeration of the memorial statues and busts that have been set up in France in the last twenty years. He gives the name, date of inauguration, and place of 223, not including the 93 statues of the new Louvre and the 117 of the new Hôtel-de-Ville. The *Revue* may well complain that France is a prey to what the Germans call the *Denkmalsucht*.

The fourth half-volume of Dr. Otto Zöckler's 'Handbuch der Theologischen Wissenschaften' (see the *Nation*, No. 893) has lately appeared (New York: B. Westermann & Co.).

— A glance at Macmillan's new *English Illustrated Magazine* shows that it is not a competitor in kind with *Harper's* and the *Century*. The scheme, in other words, is distinctly English: the contributors are everything, the editor nothing (except purveyor); there are no "departments"; there is a uniform typography. We have seen this already in the *Cornhill*, and later in *Longman's*. Indeed, compare the eight papers of *English Illustrated* with the eight of the October *Longman's*, and the variety is nearly the same—Miss Yonge's "Armourer's Prentices" being matched by Bret Harte's "In the Carquinez Woods"; Grant Allen's "Dormouse at Home," by E. Kay Robinson's "Toads, Past and Present"; Swinburne's "Les Casquettes," by U. Ashworth Taylor's "'Till Death do us Part'"; Carr's "Rossetti's Influence in Art," by Haweis's "Richard Wagner's Grave"; and (in a fashion) Huxley's "Oyster and the Oyster Question," by Dr. B. W. Richardson's "Cycling as an Intellectual Pursuit"; while Mr. Maitland's "From the Old Law Courts to the New" is, if not paralleled, at least offset by Mr. Freeman's "Titles"; and William Black's short "Supernatural Experiences of Patsy Cong" by chapters of James Payn's "Thicker than Water." But *Longman's* gives no pictures, and adheres to page-broad lines and large type, while *English Illustrated* is printed in double columns with a smaller letter, and presents a very ornamental appearance by means of head-pieces and initial letters and a large assortment of engravings. The best of these last are very good indeed, and the series illustrating Rossetti's art is interesting in a high degree; but the average is hardly up to what we are now accustomed to. Coming to the contents of the magazine, we find Mr. Swinburne's performance not worth the trouble to understand it, and Professor Huxley's (half-finished) lecture on the oyster better adapted for the columns of *Nature* than of a popular monthly. Mr. Grant Allen has given us more satisfaction than any of his colleagues, for he clearly and lightly and with proper brevity indicates the utility of the dormouse as a connecting link in the evolution of the rodents. On the whole, therefore, the British invader at present has no terrors for cis-Atlantic publishers. Nevertheless, the attractiveness and (absolute, not relative) cheapness of *English Illustrated* will, doubtless, secure it purchasers, if not subscribers, in this country, and to that extent diminish the circulation of the native products Time will show whether the English or the American idea is better calculated to win the favor of the Anglo-Saxon reading public.

—Dr. E. J. James, Professor of Political Economy and Administrative Law in the University of Pennsylvania, has contributed an interesting and valuable paper to Conrad's *Jahrbücher für Nationalökonomie* on the "Study of Political Science in the United States." The ground is taken that in no other country are the Elements of Political Economy so widely studied as in America, and nowhere else has so great progress been made within the past few years in the more advanced studies of the science. Some fifteen pages of the article, or nearly half of it, are devoted to a description of the work done in the schools and colleges to promote a more or less general elementary knowledge of the various phases of the science of government. The author then turns to a more careful consideration of the three schools established within the past few years for the promotion of more advanced studies in this direction; viz., the Schools of Political Science in the University of Michigan and Columbia College, and the Wharton School of Finance and Economy at Philadelphia. The courses of study in each of these schools are given and the peculiarities of each one pointed out. Attention is called to the fact that while the school at Ann Arbor is particularly strong on the side of History, the school in New York devotes itself more especially to Constitutional and Administrative Law, and that in Philadelphia to Political Economy and Finance. The terms of admission to the several schools are also pointed out. At the close of the paper the author devotes a few paragraphs to a consideration of the probable future of these studies in America. The most formidable obstacle in the way of any very great popularity of the schools is the fact that they lead directly to no one of the professions except the academic, in which the demand must always be limited. As yet the civil service has made no call for the technical information these schools are designed to impart. The sphere of the schools, therefore, is not so much to fit their students for professional economists as to elevate and inform that class of educated persons which is to take the leading part in moulding and directing public opinion on political affairs. Dr. James is of the opinion that schools of Political Science in this country will most successfully fulfil their work when they carry it on at the great seats of learning, and especially in connection with the great law schools. Not only do the studies form an admirable preparation for a knowledge of Law and Jurisprudence, but the knowledge thus acquired is likely to be most successfully disseminated among the masses of the people, and for that reason most influential in improving our political methods. The paper is well worthy of translation and publication in accessible and popular form.

—The assumption that professional training is always traceable in literary style has suggested many ingenious and interesting researches, but few more curious than the work of Dr. Hobart on the 'Medical Style of St. Luke,' recently published in the Dublin University Press Series. Dr. Hobart has undertaken to show (and has fairly succeeded in showing), from the language employed in the third Gospel and the Acts of the Apostles, that both are the works of a person well acquainted with the language of the Greek medical schools. This, of course, confirms the traditional view that the author of both was "Luke the beloved physician," and disposes of any patchwork theory as to the origin of the Gospel. The first part treats of what may be called the medical cases, the miracles of healing, in which the writer is more circumstantial than the other Evangelists, shows more professional knowledge, and uses technical language such as we find employed in the extant Greek medical writers, especially Hippocrates, Aretæus, Dioscorides, and Galen — language such as a layman would not be likely to use. Here the internal evidence is stronger and more satisfactory than in the second part, which deals with the medical coloring of the general narrative. Dramatists and novelists of the old school have greatly exaggerated the tendency of professional men to use technical terms in every-day speech and writing. The professional man of our time certainly does not betray himself in any such crude fashion, and perhaps the consciousness of the profession may keep down the technical. Still, such evidence is not to be set aside even when it stands alone, and, when it confirms the technical treatment of professional cases, must be allowed to have cumulative force. If, for instance, the authorship of "Kabale und Liebe" were disputed, the medical imagery of Schiller's younger days might be suffered to have weight, and the legal compounds with "where" and "there" are apt to peep out in the popular writings of lawyers. While, then, exception may be taken to details in this part of the work—as, for example, to the "medical" character of παρακολουθεῖν—there are many points of great interest and cogency, such as the technical character of the word employed for the "corners" of the sheet in Acts x., 11. The well-known predominance of σύν in St. Luke as compared with the other Evangelists is to be explained by the conservatism of medical Greek, which continued on the same lines from Hippocrates to Galen. Σύν, strictly speaking not a prose preposition, would naturally hold its own in prescriptions as in business contracts and in religious formulæ. The book is a fascinating study to every investigator of the New Testament idiom, and even those who take no interest in the Greek part of it may pick up some significant points. Grace must have done much for St. Luke when we reflect that he is the only one of the Evangelists that records the proverb cited by Jesus, "Physician, heal thyself"; and it may be worth while to notice that in the narrative of the woman with an issue of blood St. Matthew, who never spares the publicans, spares the physicians, St. Mark emphasizes the sufferings of the patient at the hands of her medical men as well as the expense of the treatment and its futility, while St. Luke looks on the pain of the treatment as a natural concomitant, dwells only on the exhaustive fees, and half throws the blame on the want of recuperative energy in the woman's system.

—The Leipsic publishing house of F. A. Brockhaus not long since completed the new edition, elaborated by Ernst Klein, of Fessler's famous 'History of the Hungarians.' The original work appeared in Leipsic in 1815-25, in ten large volumes, under the title 'Geschichte der Ungarn und deren Landsassen.' It almost completely superseded the earlier German publications of Gebhardi ('Geschichte des Reiches Ungarn und der damit verbundenen Staaten,' 4 vols., Leipsic, 1778-82) and of Engel ('Geschichte des ungarischen Reiches,' 5 vols., Vienna, 1813-14)—both

of which were issued as component parts of very extensive universal histories—in spite of great merits which render them still useful; and it found no worthy rival in German in Majláth's 'Geschichte der Magyaren' (5 vols., 1828-31), though this work, less learned but more popular, obtained a wide circulation. Nor have the German translations from the Magyar of the more recent national histories of Horváth and Szalay thrown Fessler's bulky volumes into the shade. It is, however, this very bulkiness of the original publication which has always limited the sphere of its readers, and has made a reëlaboration in an abridged form desirable. The new edition embraces only five volumes of more moderate size; its title is, 'Geschichte von Ungarn, von Ignaz Aurelius Fessler; zweite vermehrte und verbesserte Auflage, bearbeitet von Ernst Klein' (1867-83). The change in the title and the word "vermehrte"—while the work is so considerably reduced in extent—sufficiently indicate that the editor was not content with merely condensing the author's diffuse narratives and omitting some of his now uninteresting details and excessive historico-philosophical speculations. Herr Klein, a German Protestant clergyman of the extreme north of Hungary, where also Engel belonged, has to a considerable extent modified the tenor of the book by frequently substituting his own views of events, actions, and actors for those of Fessler. Thus, what is designated as a new edition is virtually a new book, following the plan, the arrangement and divisions, and the choice of topics of the old, and generally borrowing its narrative style.

—Few careers of authors have been as strangely checkered as Fessler's, and one wonders how a man so migratory and eccentric, doomed to so many changes of position, occupation, and study, could find time and tranquillity to carry out a literary enterprise of such weight and magnitude as was his. We exhibit only a portion of his vicissitudes—which form the subject of a very interesting autobiography ('Rückblicke,' etc., 1826)—when we mention that he spent ten of his youthful years, from 1773, as a Capuchin monk in various convents of Hungary and Vienna, but eventually denounced convent life to the Emperor Joseph II.; was four years professor of Oriental languages and Old Testament hermeneutics in Lemberg, and was thence forced, in 1784, by fanatical persecution to flee to Prussian Silesia; educated a prince's children, adopted Protestantism (1791), reformed with Fichte a masons' lodge in Berlin, and became royal ecclesiastical "consulent" in Prussian Poland, but renounced Masonry in 1801, and lost his position after the battle of Jena in 1806; was in 1809 called by Alexander I. as professor of Oriental languages and philosophy to St. Petersburg; was denounced as an atheist and deposed, but made a member of the Legislative Commission, and sent to the Government of Saratov, to realize some philanthropic schemes; was deprived of his salary in 1815, regained it two years later, joined the Moravians at Sarepta, was appointed, in 1819, Superintendent of the evangelical communities in Saratov, and, on the abolition of the Saratov consistory by Czar Nicholas in 1833, superintendent-general of the Lutheran congregation in St. Petersburg, where he died in 1839, at the age of nearly eighty-four. He was the author of several historical novels and other writings, but only his great history survives in universal literature.

—Among the restorations of modern times perhaps none is more remarkable than that of the tapestries called *la dame à la licorne*. They were found in a château in Boussac, which had been converted into a sous-préfecture. The officials had cut them up to fit the panels of the walls—a head here, a body there—and what they could not use that way served as carpets and mats. In such base uses M. Sommerard, agent of the Commission des Monuments Historiques, found them, and after some bargaining secured them for 25,000 francs. At the Hôtel de Cluny the fragments were spread out, fitted in place, and after some months of labor perfectly repaired. There are six pieces, each about 3 mètres long by 3.7 high. Each represents a scene in the life of a great lady of the fifteenth century. She is richly dressed in gold brocade and velvet, and has at her sides a lion and a unicorn holding lances with oriflammes and other banners. The background is a bright red; the lady and the animals stand on a green parterre. In one scene she is presenting dainties to her falcon; in another she is wearing a crown of roses, in another playing on the organ; in a fourth she is coming out of a tent bearing the device *À mon seul désir;* in another she holds the unicorn on her knees and its image is reproduced in a mirror. It is said that the rich tones, the delicate design, the brilliancy and harmony of color are not surpassed by any known tapestry. And this is what the good people of Boussac were using for door mats. They are now building a market with the proceeds. It has been discovered that the lady's name was La Viste, that she lived in Lyons, and that Pierre d'Aubusson, being desperately in love with her, had this tapestry made for her pleasure.

—The Germans do claim Copernicus as a countryman, but they leave King John Sobieski, "with his glory," to the Poles. The London *Times*, however, in reproducing the inscription of the memorial stone unveiled on the summit of the Kahlenberg, on occasion of Vienna's great anniversary, translates it thus: "From these heights, on the morning of the 12th of September, 1683, John *Römisch* Sobieski, King of Poland, . . . John George *Römisch* of Saxony, . . . and other commanders, descended with the troops of the Emperor Leopold *Römisch*, . . . to the battle for the deliverance of Vienna." (The italics are ours.) The natural inference is, that, like the Elector of Saxony, John Sobieski, though King of independent Poland, was a member of the Empire of which "Leopold Römisch" was the head—all hitherto written history to the contrary notwithstanding. But the thing is not so, and we have irrefragable evidence for our assertion. We have the original German inscription in the most authentic form before us, and in this the words corresponding to "John Römisch Sobieski," "John George Römisch," and "Leopold Römisch" are: "Johann III. Sobieski," "Johann Georg III.," and "Leopold I." Nor is the explanation of the substitution by the *Times* of "Römisch" for "III." or "I." difficult to find. The Vienna correspondent of that journal dictated his correspondence to an amanuensis, in German, thus: "Johann drei (Römisch)," "Johann Georg drei (Römisch)," "Leopold eins (Römisch)." That is, he told him not to write "der Dritte," "der Erste," or "Johann 3," "Leopold 1," using Arabic numerals, but to write "III.," "I." in *Roman* (*Römisch*) figures; and the amanuensis, strictly obeying, wrote "Johann drei Römisch," "Johann Georg drei Römisch," "Leopold eins Römisch." As the English translator of the correspondence could discover no meaning for "drei" and "eins," he left out these words without daring to alter the three times repeated "Römisch," which he probably considered an indubitably integral word of the inscription, referring to the Roman Empire.

—But even our New York dailies will nod like the "Thunderer." We recall instances, now tolerably old, when we read how "The Czar declares that Lithuania is even worse governed now than under the Emperor Nicholas," the reference being to the *Czas*, a Polish newspaper of Cracow; and again: "The Austrians have cut the railway in the rear of the Prussians, between Abo and Lepanto," towns of Finland and Greece respectively, separated by twenty-two degrees of latitude. The latter piece of news, however, given without comment, was incomparably less striking than the following cable despatch with ample geographical explanation — the latter copied from Lippincott's 'Gazetteer' — which appeared a little more than a month ago in one of the most prominent American journals:

"CONSTANTINOPLE, Aug. 21.—Brigands have captured the Governor and several councillors of Florian, near Salonica. They demand $20,000 for the ransom of the captives"

"Florian is a suburb of La Valetta, a seaport city and capital of the island of Malta. It contains the dwellings of many English families, and has barracks, a botanic garden and a house of industry for female children. Salonica is a seaport city in European Turkey, in Roumelia, capital of a sanjak. The population is estimated at 80,000, of whom 25,000 are Jews, 5,000 Turks, and the rest Greeks and Franks."

CURTIS'S BUCHANAN.—II.

Life of James Buchanan, Fifteenth President of the United States. By George Ticknor Curtis. Harper & Brothers. 2 vols., pp. 625, 707.

THE campaign of 1856 was fought, on the Democratic side, upon the doctrine that the Territories of the United States were none of them closed against slavery, and could not be closed, except in the act of adopting a State constitution prior to admission into the Union. In short, it put all the Territories in the same category that Southern territory, south of the Missouri Compromise line, had before been in. The practical application of it was the Kansas-Nebraska struggle, in which the attempt was made to force Kansas into the Union under a constitution establishing slavery against the will of an overwhelming majority of her citizens. The success of the South in dividing the North by the aid of its leading politicians, while the slave States were an absolute unit in all that affected the slave interest, led to an over-confidence that hastened their ruin. Their repudiation of all compromises in 1854 led, as we have already said, to the organization of the Republican party, and to the absorption into it of all other political organizations opposed to the Democrats. The challenge of the disunionists was accepted; the old compromises were admitted to be dead by the hand of the slave propagandists, and the exclusion of slavery from all the national territory outside of organized States was made the new platform. Mr. Curtis tells us that Mr. Buchanan did not approve the repudiation of the compromises by his party; but (as we have before said) he gives us no proof of it, and Buchanan himself contradicts him, for he lauds the platform of 1856 as just, fair, and worthy of acceptance. In addressing his neighbors after his nomination (vol. ii., p. 176), he calls it "a plain and elementary principle of all popular governments." In his inaugural he calls it "a happy conception," and in his speech at the White House in 1860 (vol. ii., p. 292) he declared it confiscation of property for a Territorial legislature to prohibit slavery.

It was the fashion among Democratic politicians of that time to talk vaguely of the aggressions of the abolitionists, which made the life and property of Southern slaveholders insecure, and naturally accounted for, if they did not justify, the threats of disunion at the South. We cannot too carefully recall distinctions which it was their policy to hide and confuse.

The "abolitionists" were a small body of earnest people who kept outside of all political parties, and devoted themselves to preaching against slavery as a great moral wrong, which ought immediately to be abolished by the conscientious act of slaveholders themselves. To suppress them would be to crush liberty of thought, of speech, and of the press. Putting them down "by an enlightened public opinion," which Mr. Buchanan recommended, had been tried by mobs when they were few and feeble, and had failed. It failed because the agitation was in favor of eternal right and justice against a horrible wrong; because the reform was one of those great movements in human progress, like the abolition of feudalism and the establishment of representative government, sure to take its place, as it has done, among the most sacred struggles for the elevation of man. As its methods were only moral ones, its suppression would directly attack every intellectual and personal liberty that freemen could hold dear. To say that the South could not live under a government which did not put this agitation down, was to say that discussion of fundamental human rights was inconsistent with their system. Yet this position Mr. Buchanan adopted.

Turning to the political movements against slavery, we find they were directed carefully and wholly against its spread. No political organization in the United States ever claimed the right, under the Constitution, to meddle with slavery within the slave States. That these parties were aggressive is untrue. Their action always responded to aggressions of the slave power, and they never reached formidable proportions in numbers till the audacious repudiation of all compromises by the Democratic party in 1854. Then the Republican party was formed, and simply accepted the issue forced upon the country, as we have already noted. When the Constitution was adopted, every foot of territory which the nation owned was for ever dedicated to freedom by the ordinance of 1787. The Union was therefore formed with the necessary understanding that no more slave States could be formed except by the subdivision of States already existing. But soon Louisiana and Florida were added to the South. It would have been right for the free States to insist that they should not be received except as free territory; but they did not. In 1819 they objected to the admission of Missouri as a slave State, because it was not a fair division of the Louisiana purchase, and was north of the Ohio River line which had been the boundary between the two sections. The Missouri Compromise followed, admitting that State with slavery, but agreeing that no more slave States should be made north of 36° 30′. Was that aggression? Then came the reduction of our limits on the northeast, and the double-faced dealing which brought the northwest boundary nearly six degrees of latitude southward. Was that aggression? The shameful history of the Mexican war was next in order, with the annexation of Texas and the boundless room for the peculiar institution to spread. The Wilmot proviso was the attempt of Northern men of all parties to offset the increase of slave territory in Texas by providing that any other taken from Mexico should be free. It was at first conceded by the South, but, failing to become law by a mere accident, the Southern demand enlarged, and the proviso was bitterly opposed and defeated. The aggression here was surely not Northern. Then came the Fugitive Slave Law and the repudiation of compromises, with the bold demand that the law of personal property should be applied to slaves everywhere within the national territory. In the face of such a history, the talk of free-State aggression was simply impudent, and, on the part of Northern politicians like Mr. Buchanan, deserved still harsher characterization.

But, it was said, your Northern States passed "personal liberty" bills. Not till after the passage of the Fugitive Slave Law, which deprived the personal liberty of free citizens of the protection of jury trial. But, if a balance were to be struck, we must look into Southern State legislation. Before that time, several Southern States had passed laws imprisoning free colored sailors on Northern ships all the time they might be in their ports, and charging the expense of the wrong upon the ships. No obstacle was made in Northern States to making cases for decision in Federal courts on any disputes arising under our laws; but when Massachusetts sent Judge Hoar to make a test case for her seamen in South Carolina, the Legislature by resolution called upon the Governor to expel him, and he was violently prevented from bringing the suit. Substantially the same was done in Louisiana. The war of 1812 with Great Britain was made for a less cause. When to these things are added the State laws interfering with the mails and with the freedom of the press, the laws against the residence or immigration of free colored citizens of the North, the balance of grounds of complaint was so greatly against the slave power, that the pretence of Northern aggression here, as in the case of Federal action, is contemptible. It is sad evidence of the deep root which early prejudice takes, that Mr. Curtis can to-day summarize those events in nearly the tone and sense of the pro-slavery politicians of 1860.

This brings us to the critical time in the life and career of Mr. Buchanan, to which all the rest was prelude. He was President of the United States. The determination of the disunionists to break up the Union, which he had described in 1850, and again in 1856 (vol. ii., p. 182), had not grown weaker, but had increased with their numbers and their power. Admit that the election of 1860 had shown that the Republican party had the power and the will to prohibit the further extension of slavery: their constitutional right to do so they thoroughly believed, and it was never really doubtful. They would do only what the fathers had done in the ordinance of 1787. The election of Mr. Lincoln was confessedly legal in form and in fact. How, then, should a patriotic President act in the face of expected secession? Mr. Curtis assumes that Buchanan had never adopted the heresy of the right of secession. The evidence is against him; but let it be assumed that it is true: what should he do? He was on personally friendly, even intimate, terms with the leading disunionists. Two of them, Cobb and Thompson, were in his Cabinet—three, if we do not accept the theory that Floyd only joined them when his peculations were discovered. His relations to Thompson were even affectionate. It is as certain that he knew the purposes of the Southern leaders as any historical conclusion can be. Yet down to the meeting of Congress in December, not only was no preparation made to meet the storm, but no word of warning was spoken. The Governor of South Carolina sent his message to the Legislature on the very day of Lincoln's election, recommending the call of a convention to consider "the mode and measure of redress," using the very words of the resolutions of '98 which have been before quoted. This was the 5th of November. On the 7th the Judge of the United States Court in South Carolina resigned, and the Grand Jury refused to act, the whole scene being only too plainly a prearranged tableau with an eye to public effect. It would help Mr. Buchanan's reputation if it could be shown that it was not also intended to meet his opinion that he could not enforce the national laws if there were no national officers through whom to do it. On the 12th the bill for the convention passed, calling it as soon as the forms of election could possibly allow. It met on the 17th of December, and was told by W. Porcher Miles that he was just from a consultation in Washington of friends from every Southern State, who unanimously urged instant secession. The Senators of the cotton States (those of South Carolina having already resigned), in a meeting on the 5th of December, had resolved that their States should secede "as soon as may be" and hold a meeting to organize a Southern Confederacy at Montgomery not later than the 15th of February. The calls for secession conventions in most of those States were already out. These facts were no secret to the country; the President knew them all, and a great deal more. No other man knew so well the purposes of the disunion leaders. Had he broken with them? So far from it that he submitted the draft of his annual message to Jefferson Davis, and the latter tells us that all the modifications which he (Davis) suggested were accepted ('Rise and Fall of the Confederate Government,' p. 59). Davis tells us further that he had gone to Washington on the urgent request of two of the Cabinet (no doubt Thompson and Cobb) "on account of the influence which it was supposed he might exercise with the President in relation to his forthcoming message." Afterward the message was changed so as to displease Davis; but unless the latter falsifies the fact (and Mr. Curtis expressly declines an issue of veracity with him), the message was at first such as the leader of the secessionists was content with.

What shall we say as to the disunion members of the Cabinet? They resigned on their own motion when they were ready, Thompson on the 8th of January, 1861, because, as he alleged, of a purpose to send troops to Fort Sumter. Writing to the President on the 10th, he says: "For more than forty days I have regarded the display of a military force in Charleston or along the Southern coast by the United States as tantamount to war. Of this opinion you and all my colleagues of the Cabinet have been frankly advised." The character which Buchanan gives Thompson in the correspondence stops the mouth of any advocate of the former from raising the question of veracity, quite as much as in the case of Davis. Before the 1st of December, therefore, Buchanan knew of these views of Thompson, if not for a much longer period. But there is evidence still more startling, if possible. The *Nation* formerly called public attention to the disclosures of Senator Clingman, of North Carolina, in his published volume of speeches (p. 526. See the *Nation*, vol. xxv., p. 171, No. 637). Clingman there tells circumstantially of Thompson's visit to North Carolina in December, 1860, as a *commissioner from Mississippi to promote the secession of North Carolina*. Clingman himself questioned the honorable character of the action unless Buchanan knew of it. Thompson assured him that he did. Clingman being still sceptical, Thompson made a second full explanation, and declared that Buchanan still wished him to go, and hoped he might succeed. Clingman adds: "I could not help exclaiming, Was there ever before any potentate who sent out his own Cabinet Minister to excite an insurrection against his Government!" Can Mr. Curtis be ignorant of all this?

Can any rational person doubt that a patriotic President would have insisted upon ridding his Cabinet of secessionists at the first movement of South Carolina on the 5th of November, if he had not done it before? It is only too plain that he was with reason regarded by the secessionists as one of them. No other theory accounts for their conduct or for his. The growing wrath of

the Northern people made him insert in his annual message of December 3 a denial of the right of secession which was not there when Davis approved the draft; and the substitution of Holt, Dix, and Stanton for Cabinet officers who resigned introduced more wholesome influences among his advisers. His message, however, remains one of the most astounding documents ever issued by the head of a government. He puts upon the North the responsibility for the rebellion, while he admits that the South had nothing to complain of but agitation. He denies the technical right of secession, while he admits that the South had the right of revolution, which the Federal Government would have no right to resist. He says it would be his duty to sustain officers of the Government in the South, but, since all have resigned, no embarrassment to them can arise from that duty. He alleged the duty to hold the forts as real estate, but the directions given to the handful of men in them "to act strictly on the defensive," and the unconcealed intention to withhold reinforcements, would naturally indicate that this annoyance would be only temporary. When the message is read as the production of a man who had committed himself absolutely to the disunionists in the belief that, used as stage-thunder, secession would scare the North into humble submission, but who was now awakened to the knowledge that an actual gulf was at his feet into which he dared not leap, it is intelligible enough. Read in any other light, it is a farrago of nonsense, and calling it "statesmanship" is the most conclusive proof of the hardihood of Mr. Curtis's advocacy.

Compare it with some of the phrases of Jackson's proclamation against South Carolina. "Treason," he said, "is an offence against sovereignty, and sovereignty must reside with the power to punish it." "Every one must see that the other States, in self-defence, must oppose it [secession] at all hazards." "The laws of the United States must be executed." "Those who told you that you might peaceably prevent their execution deceived you—they could not have deceived themselves. . . . Disunion by armed force is TREASON—are you ready to incur its guilt?" It was the remembrance of these words that made the loyal men of the country, in that autumn of 1860, cry out, as in an agony: "Oh! for one hour of Andrew Jackson." Could Buchanan have caught his spirit, and appealed to the country in his very language, what Dix and Holt and Stanton did would have been done by the whole Democratic party of the North, and the spectacle of the party standing shoulder to shoulder with the Republican party for the Constitution and the Union, would have put a bloodless end to the attempted revolution, by rebellion's quick collapse. But Buchanan had tampered too far with the crime; he could speak no denunciation of it without hearing a mocking hollowness in his own words. Yet he could not complete the transfer the revolutionists demanded and expected of him, and, caught by their own devices, they found themselves committed to a gigantic war that was to destroy them and their idol, when they had reckoned only on a martial parade.

FRANZ LISZT.

Franz Liszt, Artist and Man. 1811–1840. By L. Ramann. Translated from the German by Miss E. Cowdery. London: W. H. Allen & Co. 1882.

Liszt. Von Ludwig Nohl. Leipzig: P. Reclam, jr.

OF all the questionable doctrines preached by the *laudatores temporis acti* the silliest is doubtless the assertion that ours is not a great musical epoch, and that the composers of the present day are inferior in creative power to their predecessors. The truth is, that neither the period of Bach and Handel, nor the "classical" period of Haydn, Mozart, and Beethoven, nor the post-classical period of Schubert, Weber, Mendelssohn, and Schumann contributed so many original and valuable ideas to musical literature, or effected such a complete revolution in taste, as the last fifty years. It would be useless to search in Italian history for a greater composer than the author of "Aïda." Gounod has produced the best operas France has given to the world, and, as far as ideas are concerned, Saint-Saëns is her greatest instrumental master, Berlioz not excepted. Rubinstein, like Mendelssohn a Jew, does not always equal the latter in formal elegance, but his ideas are more vigorous, manly, and inspiring; his chamber music and his symphonies are at least as good as Mendelssohn's, and he has written some operas which would now perhaps lead the repertory were they not eclipsed by the gigantic works of Wagner. Brahms may ultimately be ranked with Schumann. Franz, Rubinstein, Liszt, Brahms, and Jensen have written songs equal in beauty to any in existence. The music dramas of Wagner are as immeasurably superior to all preceding operas in originality of conception, unity of form, dramatic expressiveness, beauty of coloring, and wealth of musical ideas, as the pianoforte compositions of Chopin (who died only thirty-one years ago) are superior in poetic beauty and formal finish to all other works written for that instrument. Bargiel, Raff, Hofmann, Gade, Kiel, Dvořak, Strauss, Bizet, and other less-known composers, have all written works equal in beauty to all but the very greatest of the classical periods. And, finally, we have a figure almost as unique as Wagner—a Hungarian, of whose wide-reaching significance and influence the general musical public has as yet but a vague notion. Liszt is acknowledged on all sides to be the greatest pianist the world has ever seen, and to have developed the mechanical resources of that instrument so thoroughly that hardly anything was left for his successors to add. He has created the symphonic poem, which marks a step beyond the classical symphony somewhat analogous to the position of Wagner's music-drama in relation to the old-fashioned opera. He introduced the Hungarian element into German music, which, like a refreshing shower, stimulated its growth in several new directions. He revived Catholic church-music, and gave it a new course and impulse. As director, performer, and critic, he devoted much of his time and influence to fostering the popularity of youthful or neglected composers; and the services of a similar kind done by Mendelssohn and Schumann, for example, seem insignificant when compared with the indefatigable efforts of Liszt to introduce the works of Chopin, Beethoven, Schubert, Wagner, Berlioz, and others to the public in all parts of Europe. Any one of these achievements would suffice to give Liszt a very high rank among musicians; together they constitute a power which cannot be easily overrated.

Biographic essays and sketches of Liszt exist in large numbers in various languages, but the first attempt to give a full and detailed account of his life and doings is Lina Ramann's, whose work bids fair to fill half-a-dozen volumes, since the two so far issued extend only from 1811 to 1840, leaving more than forty busy years "to be heard from." Frau Ramann gives evidence of acute musical and æsthetic intelligence. She is personally acquainted with Liszt, and her statements may evidently be relied upon, as it is expressly asserted in one place that she read the first sketch of her work to him in 1874, on which occasion he denied the report that his mother wished him to enter the priesthood, and "was also angry because his mother had been represented to the public as a very pious woman." In another place she demolishes a few more popular myths by stating that "Liszt's excellent memory . . . could in no wise recall the musical echo-play on the terrace at Nohant, as little as it could the evening when, with the lamps extinguished, he imitated Chopin's playing so deceptively—in revenge for a little defeat—that the hearers seriously thought Chopin was sitting at the piano." Frau Ramann has not been able to avoid occasional flights of sentimental rhetoric, and sometimes pitches the note of eulogy too high; and she would have improved her book by striking out some fifty pages of social philosophizing. But these blemishes are more than atoned for by the narrative, and especially by the lucid account of the different artistic, religious, and social phases through which Liszt passed in his early life. Good use is made of contemporaneous estimates and descriptions by critics and composers, and also of Liszt's own essays and books on art and artists which have recently been collected and reprinted by Breitkopf & Härtel. The English translation of Ramann's work is, unfortunately, very slovenly in many parts, and the technical and grammatical blunders are so numerous that it is useless to attempt to give a list of them. However, as they are mostly of a harmless nature, they need not interfere with the popularity of the book. The other book we have placed at the head of this article is quite unworthy of its author, whose admiration for Liszt should have prevented him from printing a loose and rambling essay consisting almost entirely of irrelevant episodic matter, interspersed with a few facts taken from Ramann's biography, and some descriptions quoted from Miss Amy Fay's 'Music Study Abroad.' This latter entertaining contribution to the Liszt literature gives a very vivid picture of the artist's appearance, habits, and methods of teaching, and has been translated into German at Liszt's desire.

It appears to be a law of nature that all prominent composers must either die very young or live to a very advanced age. Mozart, Mendelssohn, Schubert, Chopin, Bellini are among those who died before they had time to develop their fullest powers, while Bach, Handel, Haydn, Beethoven, Rossini, Verdi, Wagner represent the other extreme. To this class also belongs Liszt, who will be seventy two on October 22, and who does not differ from his famous predecessors in respect to the untiring energy and creative power displayed in his old age. A minute survey of the life of Liszt would give an almost complete bird's-eye view of modern music. His grandfather was steward to Prince Esterhazy, and his father occasionally assisted in the performances of the famous orchestra directed by Haydn, who died only two years before the birth of Franz Liszt. From his father Franz received his first instruction on the piano at the age of six, and three years later he made his first public appearance. We are told that Franz, who was a delicate and well-behaved child, displayed such a great interest in music even before he began his lessons, that he would often forget his playthings and listen when his father was playing. After his lessons had commenced, his devotion to the instrument became so passionate that he had to be repressed instead of encouraged; and from the beginning he gave evidence of a remarkable memory. Prince Esterhazy was present at his first concert, and was so much pleased that he made him a present of fifty florins. His second concert, shortly thereafter, was even more fruitful in results, for

it induced several Hungarian noblemen to get up a purse insuring Liszt an annual income of six hundred florins for six years. With this he was enabled to live in Vienna and enjoy the instruction of the most noted teachers of the time—Salieri in theory, and Czerny on the pianoforte. He also had the privilege of seeing and hearing Beethoven, whom he had the courage to beg for a theme to improvise upon at his farewell concert, in accordance with the custom of those days. Beethoven refused the theme, but attended the concert, at the end of which he hurried on to the platform and kissed the youthful performer.

Liszt was now eleven years old, and his father determined to take him to Paris and put him into the Conservatoire. But the rules of that institution forbade the introduction of a foreigner, and the pedantic Cherubini was unwilling to make an exception in Liszt's favor, notwithstanding the proofs of his extraordinary talent. Franz was thus thrown on his own artistic resources. Under the guidance of his father, he gave a series of successful concerts in Paris, London, and elsewhere, and when his father died, in 1827, he brought his mother to Paris and began to give lessons for a living. Before long he became a general favorite in aristocratic circles, where "le petit Litz," as he was incorrectly called, found abundant opportunity to cultivate his mind, which had hitherto received a purely musical education. How great was the impression made on all circles by his playing is shown by such incidents as these: that after one concert the actor Talma pressed him to his heart and prophesied a great future for him; while at another the orchestral players were so completely carried away by his playing that they forgot to take up their interlude at the proper moment. Already, however, a vague dissatisfaction with the life of a virtuoso appears to have made itself felt in his conscience, and he now passed through a period of religious excitement in which he resolved to become a priest—a craze which was fortunately overcome, but which reappeared at different intervals in his life. His musical enthusiasm was again stimulated by the appearance in Paris of Paganini, whose incredible performances and feats on the violin aroused in him the ambition to transfer them to the pianoforte, not literally, but with due respect for the peculiarities of that instrument; and thus commenced that series of technical achievements by which piano-playing was revolutionized. Berlioz, the creator of descriptive or programme-music, and Chopin, the musical Heine, the lyric poet of the pianoforte, stimulated his mind in other directions, as was manifested in his performances and, later, by his original compositions.

Although Liszt was distinguished above all other artists by the favors shown him by the aristocracy, which swept away the traditional barriers of social intercourse, he was prevented from marrying his first love by considerations of rank, and this fostered in him sympathies with the revolutionary movement. Still another leading motive in his life was St. Simonism, the proprietary and matrimonial communism taught by which accorded with a morbid condition of his mind and with the teachings of the early novels of his friend George Sand, and led him, apparently against his will, to form an alliance after the fashion of the time with the Comtesse d'Agoult, who subsequently acquired literary fame under the pseudonym of Daniel Stern. Ten years were thus spent, chiefly in Switzerland and Italy, during which Liszt seldom came in contact with the public, although he was by no means idle. His final separation from the Countess was apparently due partly to a growing incompatibility, provoked by a desire on the part of the Countess to "guide his inspiration," and partly to the wish to provide for the future of their three children, one of whom, Cosima, is the widow of Richard Wagner. This wish he was enabled abundantly to gratify during the next ten years, which include the most brilliant period of his career as pianist. In 1847, tired of the life of a virtuoso and of his very triumphs, he accepted a position as director at Weimar, and through his efforts the insignificant capital became once more, in a musical sense, what it had been for literature in the days of Goethe, Schiller, and Herder. Here were the headquarters henceforth of the neo-German school, the place where ambitious young composers and artists—among them Bülow, Tausig, Cornelius, Raff—found a protector, and where epoch-making works like Wagner's "Lohengrin," Berlioz's "Benvenuto Cellini," and Schumann's "Genoveva" were for the first time produced in full accordance with the intentions of the composers. To Weimar musicians flocked during those years as they have lately done to Bayreuth; and the general appreciation of Wagner's works was greatly facilitated and forwarded by the able analyses of three of them—the "Flying Dutchman," "Tannhäuser," and "Lohengrin"—which Liszt published. Here also Liszt wrote his greatest works, the symphonic poems. A conservative cabal, apropos of the production of an opera by Cornelius, induced him in 1861 to leave Weimar, and since that time he has lived alternately at Rome (where he became abbé in 1865), at Pesth, and lately again at Weimar. Artistic or general charity has been almost the sole motive during recent years that could induce him to appear in public. But the noblest of all his acts was accomplished in 1839, when he agreed to furnish the 50,000 francs required for the proposed Beethoven monument in Bonn, to which a hypocritical world had only contributed 600 francs in six months. His only stipulation when he made this offer was that he should have the privilege of choosing the sculptor.

During the first half-century of his public life, it may be said in general terms, Liszt was almost solely known to the public as a pianist and as a skilful adapter of the works of other composers to his instrument. To some extent this estimate was justified by the history of his development, since it was at a comparatively late period that he began to devote himself seriously to composition. His change of attitude is usually attributed to the fact that after having exhausted the possibilities afforded by the pianoforte, he longed for new and larger worlds to conquer. But the true explanation must be sought deeper down, in the regions of paradox. Although Liszt is the greatest pianist the world has seen, nature did not really intend him for an apostle of that instrument. A comparison with Chopin will make this point clear. Chopin was inseparably connected with his instrument. The piano was his body, and his genius its soul. For other instruments he wrote but little, and the orchestra seemed superfluous to one who could conjure such variety of color from the keyboard alone. But Liszt was never really satisfied with the piano. Almost his first great achievement was the attempt to change it into a violin by arranging for it the difficult "Capricci" of Paganini; and this was followed by the effort to *convert it into a miniature orchestra* by his transcriptions of Berlioz's "Symphonie Fantastique," "Harold," "Faust," Beethoven's nine symphonies, countless songs by Schubert, Mendelssohn, Franz, and others; selections from all the principal operas, etc. He thus accomplished results which appeared like witchcraft to the greatest pianists of his age. He could read the most complicated score at sight, and, as a mere boy, had asked Beethoven which one of Bach's fugues he wished him to play, and *in what key!* He made the piano sing like a human being, as shown by his song-transcriptions, where the words are hardly missed; he produced startling effects by doubling up melodies and chords, by introducing wide stretches. In the words of Berlioz, he produced "accents and nuances which have been unanimously declared impossible, and which until now have been unattainable"; or, as Liszt himself writes, "we make broken chords like the harp, long-drawn tones like the wind instruments, *staccati*, and a thousand kinds of passages which formerly it only appeared possible to bring forth from this or that instrument." His free and poetic "translations," as they have been aptly called, differed in spirit and result so widely from the literal ones in vogue before his day that Liszt was quite justified in referring to the latter as *derangements* rather than *arrangements*. Admitting all these things, and bearing in mind the great influence they have had in the development of pianoforte music, we are still obliged to revert to our paradox. The very language in which Liszt refers to his achievements on the piano shows that he is ever thinking of the orchestra. His ideas were too soaring, broad, impetuous to be expressed on one instrument. His compositions, therefore, like Beethoven's sonatas, frequently suggest the orchestra, and present in this respect a great contrast to those of Chopin, which are of a more esoteric nature, and never go beyond their chosen sphere. Beautiful as many of Liszt's pianoforte works are, they have not the deep significance of his later orchestral works, the outcome of his intellect in its maturity.

The apparent suddenness with which this maturity was attained has been explained, with his usual critical acumen, by Richard Wagner. Liszt, he says, did not, like other composers, pass his first period at the desk, writing weak and crude compositions based on admired models. This period, in his case, was passed at the piano, where he did not so much reproduce as actually ecreate the works of the great masters. And so thoroughly did he assimilate their ideas and master the traditional forms, that he was subsequently privileged to ignore the latter and create a new form, as suggested by the natural flow and character of his ideas. This form—the symphonic poem—has received more abuse at the hands of ignorant critics than any other form, except Wagner's music-drama. Indeed, the most common charge is, that it is no form at all. The symphonic poems of Liszt, we are told, are formless—a chaotic conglomeration of melodies and harmonies. To which we reply boldly, but calmly, that they represent a higher æsthetic type than the symphony with its four separate movements. Except in some of the greatest modern works, there is no connection between the different symphonic movements, no organic union of the parts, no relationship of ideas. The symphony is based on dance-forms—as suggested by the minuet, the predecessor of the scherzo—and its principle is the alternation and contrast of slow and quick movements. Very often the writer's interest in his task is exhausted prematurely, and the remaining regulation movements are added as mere padding. To this temptation the writer of a symphonic poem is not exposed. He invents a characteristic motive based on some striking poem or real event, and develops it in accordance with the chosen mood, making it as long or as short as he pleases. In other words, the development of a single motive here takes the place of the loose concatenation of independent movements in the symphony, and for this reason the reform introduced by Liszt is as significant for pure orchestral music as Wagner's substitution of continuous melody

and leading motives for the separate arias, duos, etc., is for dramatic music. The descriptive definiteness of Liszt's motives is so great that Wagner said he often felt tempted to exclaim in astonishment, after the first sixteen bars: "Sufficient! I have it all." And these primitive motives he develops with such a thorough knowledge of all the resources of his art, that one is compelled to acknowledge that he has ended by becoming as great a virtuoso of the orchestra as he had been of the piano.

In the symphonic poems of Liszt we constantly meet with certain peculiarities which point to the author's native country. Greater prominence is given to these peculiarities in his Hungarian rhapsodies, whose chief value lies in this, that they introduced a new national element into European music. At one time this music was too exclusively Italian, and since Beethoven it has threatened to become too exclusively German. The Polish Chopin, whose influence on the younger generation of composers is much greater than is generally known, to some extent modified this tendency; and an equal amount of grateful novelty and variety is now being introduced through Liszt's "gypsy-epic," in which he has embodied some of the most individual artistic traits of a unique nation. How far gypsy music is Hungarian or vice-versa need not be discussed here. For practical purposes they may be considered as identical. The four principal peculiarities of this music are abrupt harmonic progressions, unusual melodic intervals, great rhythmic variety, and a superabundance of ornamental passages, which often completely hide the melody, or, in the words of Liszt, "surround it like a rainbow with an iridescent halo." Schubert, Beethoven, and other Viennese musicians were struck by these features, and made some slight use of them. What impressed them chiefly, however, was the broad melody, while the harmonic peculiarities were seemingly regarded by them as "barbarisms and pleonasms" rather than legitimate artistic traits. It remained for Liszt to penetrate their inner spirit and justify their existence. In his childhood he had had frequent opportunities to mix freely with the gypsies and hear them give vent through their instruments to their feelings of joy, sadness, and pride. The impression thus made on him was as deep as that subsequently made by Chopin, Berlioz, and Wagner, or even deeper, and enabled him to become the European interpreter for the gypsies. With delicious irony he describes the attitude of the conservatives on first hearing the Hungarian intervals and modulations. They were fascinated in spite of themselves, and obliged to exclaim that "this would be quite beautiful if it were only correct!" The people submitted more readily to the charm, captivated by the insinuating melodies, and still more by the animated, coquettish rhythms. Liszt says he knows no other nation from which European musicians could learn so much in the invention and varied use of rhythms. Almost every new fragment of melody seems to have its own rhythmic peculiarity; and by calling attention to this rich mine of emotional expression Liszt has earned the gratitude of musicians for all time to come. The wild capriciousness and lawlessness of the gypsy rhythms eminently suited his temperament, which, be it well understood, is purely Hungarian, and not sensational and effect-hunting, as those charge whose acquaintance does not go beyond the dignified German and the languid Italian music.

In his old age Liszt's impetuousness has been somewhat modified and toned down, partly on account of his later sphere of composition, which has been chiefly ecclesiastic or, at least, sacred. But even here his independent and original disposition has asserted itself. The mediæval, ascetic notion that the Church must dispense with all the charms of secular art could find no sympathy with a friend of Heine's. Liszt's avowed aim was to unite the Church and the theatre in a new style, and his oratorios, while preserving the proper calm and epic breadth, make full use of all the resources of modern instrumental and harmonic devices of coloring. At the same time, his sacred compositions are not intended for one denomination, but appeal alike to all convictions. In this country they are, unfortunately, almost unknown. With a trifling exception, Liszt never wrote for the theatric stage, and has hence been obliged to wait longer for general recognition than even his friend Wagner. But his day will assuredly come, and already we are able to boast that cosmopolitan America admits his orchestral works more freely at first-class concerts than do the leading capitals of France, England, or even Germany.

THE ART OF ENGLAND.

The Art of England. Lectures given in Oxford by John Ruskin, D.C.L., LL.D., etc., etc., during his Second Tenure of the Slade Professorship. John Wiley & Sons. 1883.

To most studious people there are so serious antagonisms involved in the views of Professor Ruskin that they will rejoice at such a mature summing up of his views as his return to his Oxford professorship furnishes, and at the expression of his definite conclusions as to the relations of art and nature, to which for nearly or quite forty years he has devoted himself with a sincerity which has no parallel in art literature, and with the entire moral energy of a singularly exalted and unselfish nature. But the large tribute due to his noble and profoundly religious character—a tribute irreconcilable with a disrespectful regard of his views on any subject he considers worth his study—must not interfere with a critical estimate of views whose widely-accepted authority gives them a grave importance in æsthetic culture. Such an estimate is made the easier by his more conclusive return to the opinions and standard of values with which he startled and confused the critical world in the 'Modern Painters.'

Professor Ruskin had the misfortune in that book to open his battle with the critics, to use his own figure, with a fleet which was ill-equipped for so great an undertaking; and whatever may be his own confidence, or the faith of his numerous adherents, it is clear that the battle is to him a substantial defeat. It needs no census to show that the deliberate opinion of the thinking art-public has recovered from the audacity and energy of his attack, and that his doctrines are losing weight every day. He admits in these lectures pathetically that ninety-nine out of a hundred artists do not believe in his painting; there is probably not one in a hundred artists, who are at the same time clear thinkers on æsthetics, who accepts his theories of art. He began his career of critic at an age when no man's critical views are worth serious consideration—when, whatever may be his genius and native thinking powers, his comparative estimates must necessarily be lacking in breadth and comprehensiveness, especially in so wide a field as art, where we have no scientific basis, no recognized canons, and no authoritative arbiter. The young man, full of enthusiasm and onesided admiration, starts as an advocate, attacks and defends in a small part of the field; but the judge requires a longer study and a colder nature, and, to begin with, a wider range of likings than Professor Ruskin possesses. He began as an advocate, and unfortunately remains an advocate to the last. His diatribes against Dutch painting, which, as art, contains some of the subtlest and purest the world has seen, and in which, as in Turner, nature is used for, and subsidiary to, art, show that he never understood entirely the relations of the two, as do his judgments of Turner's work, in which he terms some of the artist's most artistic and sublime motives "nonsense pictures"; and in these lectures he shows the same narrowness of view, especially in the comparison of Rossetti and Holman Hunt. To class both these painters as naturalistic, and then to compare them in the superlative language he uses—"Beyond calculation greater, beyond comparison happier than Rossetti in this sincerity"—is to show that he still utterly confounds *art* with representation of nature.

This conclusion is forced to greater definiteness by his declaration that he is "not a poet, nor in any articulate manner could I in the least explain to you what a deep element of life for me is in the sight merely of pure sunshine on a bank of living grass. More than any pathetic music—yet I love music; more than any artful color—and yet I love color; more than any other merely material thing visible to these old eyes in earth or sky." This is what all artists who devote themselves to art rather than to nature-painting have always felt of Ruskin—he loves nature and preaches nature, and only art as subordinate to her. This is the moralist's view, but not the artist's. There is not, and never has been, a consummate artist who would hesitate to sacrifice nature to his art whenever he found that the latter required it. This Rossetti did; this Holman Hunt is incapable of doing, because he is primarily a naturalist—not, like Rossetti, an artist. When Rossetti called on nature, it was to give him matter for his art; Hunt only calls in art to help him give his views on nature; and any comparison of them as on the same level drags the former down from a height where he was supreme to a level with a man who has, in the proper sense of the terms, no imagination and no ideal. The most wonderful gift of Rossetti, and one in which he had no contemporary equal, was his power of purely imaginative conception—his most powerful compositions being struck out at a heat and without any model even for his accessories. Many, and some of his best, drawings in water-color were done in the same way. How far Hunt is from this will be shown by a story told by one of his friends of his "Pot of Basil" picture. He and this friend were walking in the country one day, while Hunt was painting this picture, which represents Isabella embracing the pot of basil in which the head of her lover was concealed. Hunt, unable to find a pot which suited him, had modelled one, had it painted to his own design, and then painted it in his picture. During the walk his friend noticed that Hunt was in a deep study and seemed distressed. He thought of bad news or trouble, but asked no questions, when finally Hunt broke out, saying that he was not sure if the pot were large enough to contain a man's head, and went home directly to measure it, when, finding that it was too small, he broke it up and had one made of the proper size.

Rossetti, again, was a colorist of the largest type—a man who, if he had been trained in the school of Bellini, would have ranked with the greatest of the great Venetians. When Professor Ruskin says that "Holman Hunt, in the very beginning of his career, fixed his mind as a *colorist* on the true representation of actual sunshine, of growing leafage," etc., he only shows clearly, what was tolerably evident from his early attempts to show that Turner's color was studied from nature, that he has never recognized the vital law of color-art—that it is

conceived and felt exactly as music is, and never was, in any of the work of the great colorists, nor ever can be, found by imitating the tints of nature. The term *colorist* no more applies to Holman Hunt than that of musician (in the sense of composer) would apply to a man who imitated the songs of birds and the voices of animals. None of the great schools of art have had their beginnings in naturalistic study, though more or less they have ended there, and then fallen. Rossetti is the only great colorist who began with realistic study from nature, and this is probably the root of his failure where he failed, perplexed by two antagonistic systems. Turner has never, in all his range of study, attempted a realistic rendering of the color of any natural object. This will show the fatal error of Professor Ruskin's system of teaching if the development of a school of art is to be aimed at. If only a keen and passionate study of nature is wanted, it is an excellent system to make amateurs and painters of natural history. The world has immense cause of gratitude to Professor Ruskin for his opening of its eyes to the value of pure natural beauty and the morality of the love of nature; but none for his teachings on art, in the true acceptation of the word: there be is utterly misleading.

A curious instance of the disregard of local color by Professor Ruskin, when he is making a plea, is his describing the lodgings of Mr. Rossetti as "a garret in Blackfriars." Rossetti had a comfortable and delightful suite of rooms on the first or second floor of a house looking on the Thames, with Stanhope above him, and some one still above *him*. Few painters in London at that date had better, and few so luxurious, quarters as Rossetti.

THE ECONOMIC REVOLUTION IN INDIA.

The Economic Revolution in India and the Public Works Policy. By A. Connell, M.A., author of 'Danger and Discontent in India.' London: Kegan Paul & Co. 1883.

WHAT Mr. Connell very truly describes as 'The Economic Revolution in India' dates from the Governor-Generalship of Lord Dalhousie, but it was not until the suppression of the insurrection of 1857 that the Indian Government adopted the policy of subordinating all its other functions to the one paramount object of giving effect to this economic revolution. When the fears and antipathies excited by the great outburst of 1857 had in some measure subsided, and Englishmen could investigate the causes of that event with at any rate some approach to reasonableness, the extraordinary poverty and wretchedness of the people were facts too patent to be denied or unperceived. The extinct East India Company was still useful as a scapegoat which could be held responsible for all the ills that afflicted the Indian peninsula, and this poverty and depression, without further inquiry, were set down to the neglect of the Company to develop the wealth of the soil by means of great public works. A more excellent method, it was determined, should now be followed. India was to be brought, through the agency of a wise and beneficent government, as a borrower into the money markets of Europe, and with the funds thus obtained the productive power of the soil was to be enriched, the people protected against famine, and the interior of the country opened up by a network of railways. Even thus early there were not lacking voices which sounded a warning respecting the dangers and difficulties that might be revealed upon this seemingly short and easy cut to prosperity; but their remonstrances were addressed to deaf ears. Amid the plaudits of all "the experts," the Indian Government transformed itself into a great speculative company for the improvement of its Indian estates, and for a time all went, or at least seemed to go, as merry as a marriage-bell. The introduction of huge quantities of "plant" for the construction of railways, etc., swelled the imports into India; the obligation to pay for this "plant" caused a corresponding inflation of the exports; and none of the authorities cared to remember that it was mainly food which was being carried away from India, and only iron rails imported in its stead. The first shock to the pleasant dream of India's rapidly-increasing prosperity was given by the Behar famine of 1873. This was followed by the far more terrible dearth of two or three years later, which, beginning in Madras, swept from province to province until it had ravaged fully three-fourths of the continent, and swept away eight millions of human beings, besides cattle innumerable. In the face of such an appalling calamity, it was impossible to deny that the new public works policy had signally failed in its most important objects. It had neither averted famine nor had it placed the population in a better position to battle with a season of scarcity.

The advocates and agents of this policy were constrained to admit this, but they contended that, although it had not fulfilled all that was anticipated, it had accomplished much. Great as had been the mortality, it would have been far greater but for the railways and canals which had been constructed during the last quarter of a century. The opposite party contended, on the other hand, that these public works were a main cause of the famine, because, in order to pay for them, the people had been stripped of all their wealth, till their sole means of subsistence consisted of the crop actually in the ground. And if that perished, they had no escape but to perish also. This is Mr. Connell's contention. Both sides are agreed as to one important point—that the population which was to be injured or benefited by the "economic revolution" was extremely poor. Its normal burdens (so to speak) were an alien Government imported from a distant country at a tremendous cost, and a foreign army of 60,000 men permanently quartered upon the country, also at a cost far in excess of what any similar body of men would cost in Europe. The difficulty experienced in raising a revenue adequate to meet these burdens was shown by the existence of a salt-tax of almost incredible severity. A ton of Cheshire salt, which in England was valued at ten shillings, could not be landed in Bengal until it had paid a duty of upward of £8, and, with freight and other charges, cost £10 10s. to the people of the country. It is plain that to a people thus circumstanced the least aggravation of their burdens involved a serious decrease of the barest necessities of life, for no government of ordinary humanity would have imposed so monstrous a tax upon salt had there been aught else which it could tax. Now, in the working out of their calculations, the advocates of the "economic revolution" wholly ignored the element of time. They reasoned and acted as though for every rupee of additional taxes taken from the Indian agriculturist he would receive an immediate equivalent in the shape of a canal or railway or some other beneficent public work. They forgot, or at any rate acted as if they forgot, that while the taxes necessary for the construction of these public works were a burden which must be immediately imposed, the benefits to be derived from them lay in a distant future. They forgot, also, that while the burden was universal, the advantages were circumscribed; for it was plainly impossible to construct railways, canals, embankments, or whatever else was required, all over India at one and the same time. So that, even on the assumption that the Public Works Department of the Indian Government was guided in all its operations by a spirit of perfect rectitude and infallibility—that it never jobbed, never blundered, was never deceived—the first results of its vast schemes were bound to be a serious aggravation of the general poverty. The people were brought nearer to the clutches of famine by the policy which was intended as a protection against it.

It is, however, unnecessary to say that the Public Works Department was not inspired by a spirit of infallible wisdom. Take, for example, the manner in which what are called the "guaranteed railways" were constructed. Companies were invited to form themselves in London for the building of these railways, and the Government of India undertook to guarantee 5 per cent. upon all the capital expended from the day on which the work was taken in hand. The result was that all economical checks were annihilated at the outset. It mattered nothing to the constructors of these railways whether their work was done cheaply or extravagantly; their dividends flowed in, not in proportion to the receipts, but in proportion to the expenditure.

"I think," said a distinguished Public Works officer, in his evidence before Parliament, "the understanding was rather of this kind: Here are these railway engineers: they are very fine fellows, and know their work a great deal better than you do, and are not to be controlled too closely. Then, too, the system of audit was extremely imperfect: it was what is called technically a post-audit—nothing was known of the money expended till the accounts were rendered. The result of the system was that, on one railway—the East Indian Railway—£4,000,000 sterling out of £20,000,000 had been disallowed on the capital account. The only thing, however, to be done under those circumstances was to allow it, and bring it all into the capital account again, because under the contract, as it was worded, it was quite impossible to disallow it finally, and it was quite understood that whatever was spent must be eventually passed."

The consequence of this laxity has been that no less a sum than £28,000,000 has been abstracted from the opulent Indian ryots as interest upon these guaranteed railways, and appropriated by millionaires resident in London. This huge sum is in excess of the receipts legitimately earned by these railways. Nor is this the only way in which the forced construction of the Indian railways has tended to deepen the general poverty. Before they existed, the entire carrying trade of the country was, of course, in native hands, providing a livelihood for hundreds of thousands of families; it has now passed into the possession of strangers, while its former possessors have been flung back for their subsistence upon an overcrowded and deteriorating soil. As for what are called the "state railways," these were avowedly constructed for military purposes. They have not developed, and were not intended to develop, the wealth of the country to any appreciable degree. Those whom the great extension of the Indian railway system has benefited are not the Indian agriculturists, but the private companies which constructed them, and the European middlemen who have contrived to appropriate nearly the whole of India's foreign trade.

The irrigation projects of the Indian Government threaten to be even more disastrous to the continent than the network of costly railways. Irrigation was a matter on which the authorities could not have gone astray had they condescended to take the people of the country into council with themselves; for the most careless observer who travels over India cannot fail to be struck by the abounding evidence of the thorough manner in which the advantages of artificial irrigation were appreciated and realized by the inhabitants.

"In Madras and Mysore," wrote the Famine Commissioners, "the ingenuity of man has been employed for many centuries in taking advantage of every locality in which water can be caught and stored, and prevented from running uselessly to the sea. Where a depression exists, with two or three square miles of catchment above it, an earthen embankment is thrown across it; some water is caught by this, to be guided to the fields below, while the surplus escapes, and flows past the flank of the embankment. Half a mile lower down another embankment is formed, and another beyond that, each larger and stronger than the one above it, as the drainage area of supply becomes larger. When the volume of water has become large, the embankment is often faced with stone; masonry sluices are formed in the embankment, communicating with channels which lead to the irrigated area below. The closing and opening of these sluices, so as to distribute the water fairly and in order, became the occupation of a hereditary servant of the tank. The duty of repairing and turfing the embankment, and keeping the stone revetment, the sluices, and channel in order attaches either to the villagers who benefit by the tank, or to some landowner (the heir, perhaps, of the original constructor), who is remunerated by the possession of rights over part of the land irrigated, or to Government, in case of the larger tanks. Some of these may be more properly called lakes. . . . The largest . . . are forty miles in circumference. . . . The same system of tank construction exists . . . in the eastern part of the Hyderabad State and of the Central Provinces. In Rajputana and Central India tanks are not unfrequent, and some of them are splendid works, made by throwing embankments or masonry weirs across the valleys between hills on either side."

Irrigation by means of canals, and still more largely by wells, was practised all over India long before the advent of the British power, and the notable fact was that these great works of public utility were nearly always the creation of private munificence, and were maintained in repair by the spontaneous labor of the village communities which profited by them. They enriched the land while they cost the state nothing, either for repairs or supervision. But under British rule all spontaneous action on the part of the people had been so emphatically discouraged by the authorities that not only had the stream of private liberality been thoroughly quenched, but the irrigation works over a great portion of India had been allowed to go to ruin. When the Government tardily awoke to a sense of their shortcomings, it was obviously their wisest policy to endeavor to revive the public feeling which had formerly found expression in these monuments of public utility. But this was far too modest a rôle to be adopted by a Public Works Department immensely wise in its own conceit. The traditional practice of the British in India had been to assume that the natives could teach them nothing, and the Public Works Department was not prepared to deviate from it. The people, as heretofore, must be content to stand still and see their salvation effected by their all-wise rulers. In a few instances the Department condescended so far as to repair the canals or embankments constructed under native rule, and it is hardly too much to say that these are the only works in India which are really remunerative to the state. By far the larger part have not returned and never can return an adequate profit upon the money sunk in their construction. These irrigation works were constructed by one of two methods, and it is difficult to say which method was the more ruinous to the taxpayers: either they were constructed out of revenue, or from guaranteed private capital. In the former case their progress was painfully intermittent—sometimes for months together they did not advance at all, the entire establishment doing nothing beyond drawing their pay with the greatest regularity; while the system of guaranteed private capital is described in an official report as

"a sham system of apparently independent action, by which the whole pecuniary responsibility is in fact thrown upon the Government, and the whole of the natural checks on bad management and extravagance, and the whole of the practical compensations to the community for the errors of individuals, are almost altogether abandoned or nullified. . . . One of the gravest objections to the present system of guaranteed joint-stock companies is this, that the operations of such companies have no necessary relation to any real wants of the community, still less to the most pressing wants. A party of speculators wish to make money; some scheme is hit upon which is declared likely to be productive of great profit; a company is formed to carry it out, and a guarantee is asked for. There is no attempt made to look at the real wants of the country, to balance the available means and the nature of the claims of various projects in various provinces. It is sufficient that so much British capital is available for expenditure on what are said to be works of improvement in India; and a cry is raised that the Government, if it refuse the guarantee, is obstructing improvement. There is no thought taken of how the guaranteed interest is to be raised, of who will pay it, or who will profit by the works constructed by such a company."

The situation reminds one of a scene in Burckhardt's 'Travels in Arabia.' He finds an Arab by the sacred well of Zem Zem in the dying throes of a fever. The poor creature has dragged himself to the spring under the impression that its miraculous properties will restore him to health. He has drunk prodigious quantities of the water, and thereby greatly aggravated his sufferings, but he remains convinced that these sufferings are owing not to the quantity he has drunk, but to the fact that he has not drunk enough. If only he could drink as much again, he would become quite well.

The Life and Achievements of Edward Henry Palmer, late Lord Almoner's Professor of Arabic in the University of Cambridge and Fellow of St. John's College. By Walter Besant, A.M. With portrait. E. P. Dutton & Co. 1883. Small 8vo, pp. ix.–426.

In one respect Palmer was the most brilliant English Orientalist of the century, perhaps unexcelled by any European in this or any preceding age; Professor Nicholl, of Oxford, calls him England's "greatest Oriental linguist and readiest Oriental scholar." Without being a scientific grammarian or philologist, he had a most astonishing capacity for learning to speak and write foreign languages—he was a modern English Mezzofanti. He picked up Italian (in all the dialects) and French from Italian and French residents and sojourners in London, and he knew a number of other European tongues. He began the study of Asiatic languages about 1860, being then twenty years old, and in five or six years from that time was able to speak and write Persian, Arabic, and Hindustani with the fluency and grace of a native. His account in Urdu, written for a native newspaper, of the Shah's visit to England was extolled by the editor as "charming and wonderful." A ghazal that he wrote was declared (of course, wrongly) by a learned Mavlavi to have been taken from the poet Khusru. During his visits to the Sinai peninsula he conversed readily with the various tribes, and with each in its own dialect. The minuteness and accuracy of his acquaintance with these three Eastern tongues were astounding, and were the result of unflagging energy and perseverance combined with linguistic talents of a very high order. That he was capable of doing excellent work of a more serious nature is shown by his translation of the Kuran, his Arabic, Persian, and Hindustani grammars, his edition of the Arabic poet Beha ed-din Zoheir, and his revision, in company with Dr. Bruce, of Henry Martyn's Persian translation of the New Testament. His 'Desert of the Exodus' is too well known to need commendation.

Palmer's private life is full of interesting traits. He was the opposite of the typical Dryasdust student of Eastern languages. He retained almost to the last the spirits of a boy. He was fond of outdoor life, of social gatherings of friends, of jesting and satirical poetry, of theatrical exhibitions, of mesmerism and spiritualistic tricks, of all strange and disreputable characters, especially of the gypsies, whose language he mastered, and whom he studied in company with Charles Leland. He grew impatient of the routine of academical life, and in his later years threw up his University position, tired of "teaching boys Persian grammar," and went to London to engage in newspaper work. It was here that he was found by Captain Gill, who came to him on the part of the Government, and with whom, after consultation with Lord Granville and Lord Northbrook, he determined to undertake the famous mission to the Arab tribes which cost him his life; and he greatly enjoyed the eager, busy life of the city. He liked being with men, and he liked letter-writing; a collection of his letters—English, Persian, Hindustani, and Arabic—would make an attractive volume.

Mr. Besant has made a very readable 'Life' of Palmer, with whom he was for a number of years intimately associated. He writes not with the coolness of the biographer, but with the affectionate enthusiasm of a personal friend and the emotion called forth by Palmer's tragic ending. The full account that he gives of the desert ride of the Sheikh Abdullah (so Palmer was called by the Arabs) is an interesting contribution to the history of the late Egyptian war. It was Palmer's negotiations with the Bedawin, says Mr. Besant, that made it possible to guard the canal by a patrol service of gunboats, and to conduct the operations that led to Tel-el-Kebir. He adds that there has been no recognition as yet by the English Government of the brilliant service performed at a critical moment by the only Englishman, except Captain Burton, capable of rendering it. In an appendix Mr. G. F. Nicholl, Professor of Arabic at Oxford, and of Sanskrit and Persian in King's College, London, gives a long and striking description of Palmer's work as an Oriental scholar, with quotations from his Hindustani, Persian, and Arabic writings. Mr. Leland also contributes an interesting account of his and Palmer's gypsy experiences.

Bibliothek aelterer Schriftwerke der deutschen Schweiz, herausgegeben von Jakob Baechtold und Ferd. Vetter. Frauenfeld. 4 vols. 1877–1882.

In this yet unfinished collection the enterprising Swiss publisher proposes to reëdit the more important literary productions of German Switzerland, written during mediæval and modern times, after the most approved methods of philological criticism and literary comment, and, whenever the contents of one volume are the products of a single author, to preface them with an elaborate and exhaustive biography embodying everything that can possibly throw light on his life and writings. The plan of this literary enterprise is not confined to the republication of authors known to the public, but embraces manuscripts newly discovered.

To this class belongs the 'Stretlingen Chronicle,' a curious legendary report in the prose of the fifteenth century, and its contemporaneous appendix "On the Origin of the Inhabitants of Schwytz and Hasli Valley," both dealing with the traditions and legends current in the Alpine valleys at that early epoch. These have been edited by Professor Baechtold, and form a vol-

ume of moderate size, the first of the series. Swiss poets and prose writers, like Ulrich von Zazikhoven, the minnesinger, and a score of others who lived before this time, will appear in subsequent volumes of the series, which does not follow any historical order.

Niclaus Manuel, the painter-poet of the city of Berne, and his writings form the contents of the bulky second volume, edited by Professor Baechtold. To the satirical productions of this young artist was due, to a great extent, the overthrow of the Roman Catholic worship and the introduction of religious reform within the limits of his State (1528); hence his dramatic, melodramatic, and lyric writings, all of which are carefully commented, possess a singular historic interest. The verses to Manuel's celebrated "Todtentanz" are reproduced in full, and a glossary is added to the volume.

Albrecht von Haller's quaint and amiable figure, combining the poet, moralist, naturalist, and physician in one and the same person, is met with in the third volume, which gives, in 960 pages, his biography and a detailed account of his literary achievements, his lyric poems, and his correspondence (hitherto unpublished) with Bodmer in Zürich. This has been edited by Prof. L. Hirzel. To the present generation Haller's style appears no doubt old-fashioned and clumsy, and his measures sesquipedalian; nevertheless, his contemporaries greeted his appearance by printing thirteen editions of his lyric poems. He was a reformer of the poetry and literature of his time, and succeeded by infusing into them a healthier, more serious tone, through the introduction of national subjects taken from nature and history, by discarding foreign (especially French) influences, and by relieving the poetic diction of his time from its bombast and excrescences. Some lyric poems of Haller contained in this volume had never seen the light before, and Hirzel was so fortunate as to discover and utilize many documents bearing upon Haller's life with which his former biographers had been unacquainted. It is difficult to find a more vivid picture of the literary life of the eighteenth century than is presented by this voluminous biographic sketch of the great scientist.

The popular songs of the German Swiss were always esteemed for their quaintness and expressive wording, even when their melodies were not above the level of those of the neighboring German provincials. Songs of liberty and political rhymes necessarily predominate in the "land of freedom," and become even profuse in times of revolutionary excitement; but pastoral, erotic, and satiric songs are those which best reflect the popular heart and sentiment. The earlier collections of Swiss popular poetry, epic and lyric, made by Wyss, Rochholz, H. Kurz, and others has just been supplemented by Professor Ludwig Tobler's 'Swiss Popular Songs,' forming the fourth fascicle of the meritorious series we are describing. Tobler, who is now busy editing the 'Dictionary of German-Swiss Dialects' (reviewed in the *Nation*, No. 910), has prefixed to the texts of the songs a readable historic and literary sketch of the popular poetry of his country, in which he treats of the formal (or linguistic and rhythmical) and the material aspect of this very interesting subject, gives a full chronological list of the historical songs, and also speaks of the channels through which the songs have come down to our time. The textual portion includes more than one hundred and twenty spiritual and secular, tragic and comic, satiric, erotic, and political songs, long and short, but always highly attractive, and manifesting the popular feeling without any bias or restraint. The smaller rhymes, which are not the least taking, amount to about a hundred, and many of the best-known lyrics were excluded because they are easily accessible through any of the older collections.

How to Get On in the World, as Illustrated by the Life and Language of William Cobbett, to which is added Cobbett's Complete English Grammar, with Notes by Robert Waters, Teacher of Languages and Literature in the Hoboken (N. J.) Academy. New York: Jas. W. Pratt. 1883. 12mo, pp. 285 and 272.

WILLIAM COBBETT, if not an attractive character, is a very interesting one, and the active part taken by him in all the public events and controversies of an important period makes him well worth knowing to all who are students of that period. For this purpose, Mr. Waters's life is well suited. He has resisted the temptation to make a big book—which would have been so easy in the case of a man like Cobbett; and the besetting temptation of biographers to make out their heroes to have been immaculate. He admires and defends him as a whole, without defending every act, and has given us in a small volume really all that one needs to know about this man. He has had the good sense, too, to let Cobbett tell his own story for the most part—an easy thing, in so voluminous and egotistical a writer, and a very desirable thing in a writer so racy and entertaining. He has done this so well that we will not quarrel with him for sometimes saying too much himself, instead of letting the subject of his biography speak. What he says, moreover, is generally good and pertinent. Cobbett's Grammar, which occupies the second half of the volume, is a desirable addition to it, as is the excellent portrait which faces the title-page.

Lancashire Gleanings. By William E. A. Axon. Manchester: Tubbs, Brook & Chrystal. 1883. 8vo, pp. 390.

OF principally local importance, this is an interesting and valuable book for Lancashire people, wherever they may be, and capable of affording entertainment and instruction to readers of any class. It consists of about fifty disconnected papers, of the variety and character which might be expected—some of them having been read before societies, others printed in periodicals, and others now appearing for the first time. Several of these have a more or less close connection with this country. The most valuable, we suppose, is that upon "Ann Lee, the Manchester Prophetess," who was, it will be remembered, the holy prophetess of the Shakers. Other more than local papers are the long one upon "Sunday in the Olden Time," "Robert Wilson and the Invention of the Steam-Hammer," "The Lancashire Plot (1694)," and "Prince Charles Edward Stuart's Supposed Visit to Manchester"; while the collections of stories, ballads, and proverbs, though not so numerous as one would have desired, are altogether acceptable.

BOOKS OF THE WEEK.

Benjamin, J. P. A Treatise on the Law of the Sale of Personal Property; with References to the American Decisions and to the French Code of Civil Law. Fourth American, from the latest English, edition. By E. H. Bennett. Boston: Houghton, Mifflin & Co. $6 50.

Betham-Edwards, M. Pearla; or, The World After an Island. Harper's Franklin Square Library. 20 cents.

Bishop, W. H. Old Mexico and her Lost Provinces: a Journey in Mexico, Southern California, and Arizona. Harper & Bros.

Braddon, M. E. Phantom Fortune: a novel. Harper's Franklin Square Library. 20 cents.

Brown, J. C. Finland: Its Forests and Forest Management. Edinburgh: Oliver & Boyd.

Bunner, H. C. A Woman of Honor. Boston: J. R. Osgood & Co. $1 25.

Cooke, J. E. Bonnybel Vane; embracing the History of Henry St. John, Gentleman. Harper & Bros.

Dick, W. B. Games of Patience; or, Solitaire with Cards. Dick & Fitzgerald.

Frédéricq, Prof. P. L'Enseignement supérieur de l'histoire à Paris: Notes et impressions de voyage. Paris: Georges Chamerot.

Hale, P. M. In the Coal and Iron Mountains of North Carolina. New York: E. J. Hale & Son.

Hall, E. H. Ten Lectures on Orthodoxy and Heresy in the Christian Church. Boston: American Unitarian Association.

Henry Holt & Co.

PUBLISH:

MRS. ALEXANDER'S NEW NOVEL,

The Executor.

16mo, Leisure Hour Series, $1; Leisure-Moment Series, 35 cents.

Symonds's Italian Byways.

By John Addington Symonds, author of 'Renaissance in Italy.' 12mo, $1 75.

Mrs. Miller's 'In the Kitchen.'

By Mrs. E. S. Miller. Square 8vo, $2 50. Being a new edition of this very popular and practical cook-book.

NEW CATALOGUE OF RARE, STANDARD, SCIENTIFIC, CURIOUS, ETC.,

American and Foreign Books,

Containing Works printed in XVth, XVIth, XVIIth, and XVIIIth centuries, books printed by Benj. Franklin, Old English Dramas, scarce Americana. Fine vellum binding, etc. Sent on application by LEON & BROTHER, 78 E. Washington Sq., N. Y. City.

The Disposal of Sewage in Suburban Residences.

By EDWARD S. PHILBRICK, M.Am.Soc.C.E.

This pamphlet is designed to give all the information necessary to enable the householder in rural districts, or where there are no sewers, to substitute for the foul leaching cesspool the cleanly, safe method of disposing of house wastes by distributing them through the soil, where they become an aid to vegetation and their noxious qualities are destroyed. Illustrations of tank and drain pipes are given, with full details of construction. For sale by all newsdealers. Price 30 cts. (1s. 6d.)

THE SANITARY ENGINEER, 140 William Street, New York, and 92 Fleet Street, London.

My September Special List

OF RARE and CHOICE EDITIONS OF THE BEST BOOKS in their finest state, for the most part personally selected, will be sent (*gratis*) to any address on application.

ROBERT M. LINDSAY,
828 Walnut Street, Philadelphia.

Preparation for Harvard

AND OTHER AMERICAN AND ENGLISH COLLEGES,

AND FOR WELLESLEY, LADY MARGARET HALL, AND GIRTON COLLEGES FOR WOMEN.

By E. R. HUMPHREYS, LL.D.

The next yearly session begins this day. Only eight pupils are admitted, of whom *three of either sex* may be received in the family.

Dr. Humphreys gives special attention to preparing earnest students to enter as Sophomores.

There are two vacancies for resident pupils.

For circulars and proofs of recent success, address
E. R. HUMPHREYS, LL.D.,
129 W. Chester Park, Boston.

Oct. 2, 1883.

F. W. CHRISTERN,

37 West Twenty-third Street, New York,

Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogue of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

VICTOR TRICYCLES.

Highest class work; new features. Send 3-cent stamp for illustrated Catalogue.

OVERMAN WHEEL CO., Hartford, Conn.

SEND for Catalogue of American Poetry from the Collection of the late C. Fisk Harris, of Providence. W. T. TIBBITTS, Providence, R. I.

The Nation.

NEW YORK, THURSDAY, OCTOBER 11, 1883.

The Week.

THE Republican State Committee has issued a very proper appeal for contributions toward the expenses of the approaching canvass, which we trust will be heartily responded to, and especially by those Republicans who have supported and pushed the recent changes in the law, which make the special pursuit of office-holders for such contributions a criminal offence. The contribution of money for legitimate party expenses according to his means is the duty of every voter, just as much as the casting of his ballot; because party organizations cannot be maintained and made effective without money. One of the worst results of the old system of relying on office-holders exclusively for the sinews of war was that it spread through the other voters of the party the feeling that the supply of money was the special and peculiar duty of the office-holders, and was not incumbent on any one else unless he was a rich man who expected office or had an axe to grind. It will take some little time for this feeling to die out, but we trust every voter who cares either for political purity or party efficiency will rid himself of it as soon as possible. The ability of a party to get from its members the means of conducting its canvass is one of the great tests of its earnestness and of its title to public confidence. The new system will not, however, work well till there is more openness about the disposition made of the money. As long as no accounts are kept and all vouchers are burnt after the election, conscientious men will be chary about giving.

The Virginia campaign has assumed an exceedingly alarming aspect. Mahone's workers are said to be giving notice in several counties that no "straightout" Republican meetings can be held. On the Democratic side systematic efforts are made to draw Mahone into a duel by "heaping aspersions upon his valor." Ex-Congressman Goode has published a card in response to some of Mahone's statements, in which he calls the Senator a "traitor" who has betrayed his constituents and sold his people for a price, who has "done more to debauch public morals and ruin the good name of the State than any other man who has ever lived upon her soil," and who "bears upon his forehead to-day the brand of liar and coward" placed there by Jubal Early. After these restrained expressions, Mr. Goode observes that such a man is unworthy any further notice, and dismisses him as "beneath contempt." Lest Mahone should not consider this card as sufficient provocation for a challenge to mortal combat, Mr. Bierne, the Richmond editor who proved his valor a few months ago by sending a charge of buckshot into the safest part of the person of a rival editor, speaks in his paper of Mahone as "one who has no courage of heart, mind, or body to meet any man in a fair field and a square fight." As a consequence of these threats the "question on every lip" is said to be: "What will Mahone do about it?" That places the campaign in a new aspect, with the pistol as the main argument on both sides.

A correspondence between the late President Garfield and ex-Governor D. H. Chamberlain, which took place in 1880, has been published, some portions of which would be useful reading for President Arthur. Mr. Chamberlain is rather prolix, but the sum and substance of what he says is that the great need of the South is good local government, and the great defect of the Republican party at the South is that it is largely composed of rascals who cannot make good local government. He therefore urged President Garfield to turn the rascals out when he came into power, and appoint none but good men to office, as the true way of commending the Republican party to the confidence of the Southern people; and he mentioned Mahone, the apostle of repudiation, as a person especially unworthy of any mark of trust or confidence from a Republican Administration. President Garfield, in his answer, expressed his agreement with Mr. Chamberlain's doctrines, all and singular, and especially with the view he took of Mahone and his party. One consequence of his death, therefore, was that Mahone was taken up and made a pet of at Washington, and had the Federal service prostituted in aid of his rascality, while a vigorous agitation, approved of by the President in his opening message, for the reform of the civil service, was going on at the North. An odder mixture of the good-lord-good-devil policy was perhaps never witnessed. It is not surprising, under these circumstances, that the Federal Government and the Republican party should still seem to many honest Southerners the incarnation of political wickedness.

Money still remains idle in the banks, and capital does not take hold of new enterprises. The list of failures for the third quarter of 1883 shows 1,806, with liabilities of $52,072,884, against 1,300, with aggregate liabilities of only $18,942,803, for the corresponding quarter of last year. The iron trade is by many persons considered the index of all other trades. If we accept it as such now, it does not promise much for an improvement in general business in the near future. It is asserted that the reduction of $1 per ton in the price of pig iron not long ago has not increased the consumption, and that the demand is less than the supply; and it is thought that production must be curtailed by more furnaces going out of blast. The coal trade, so intimately connected with the iron trade, is in a similar condition. During the last week there was a reduction in prices, and it is thought that the production will be restricted in order to allow the demand to overtake the supply. On the other hand, the export movement of both cotton and breadstuffs is increasing, and though it has not yet had the effect of reducing the rates of sterling exchange quite to the specie-importing point, one-half cent reduction in the rates for bankers' bills would probably necessitate considerable imports.

There is probably nothing more extraordinary in General Butler's career as Governor of Massachusetts than his sending delegates to the Charity Conference at Louisville to get a harrowing report on the Tewksbury Almshouse affair inserted in the proceedings. One of the delegates was a quack doctor named Flower, who travels from city to city, performing, according to his own account, "phenomenal cures," and possessing "miraculous powers"; the others were a Mr. Carrigan and Miss Alzire A. Chevaillier. These three got up a glowing report condemnatory of the management of Massachusetts charities, and comparing Butler to Jesus Christ and Julius Cæsar, which they got printed in the local papers, as having been received by the Conference as an "eloquent defence" of the Governor's course about the Tewksbury Almshouse. It was, however, voted by the Conference to strike all this portion of it out of the permanent report of the proceedings. Then Mr. Carrigan, having pledged himself not to say anything more about Tewksbury, got leave to print, as made, a short speech, which appeared in the newspapers next morning as a gross personal attack on Mr. F. B. Sanborn, the Massachusetts Inspector of Charities, and this fraud had to be denounced in a card by Mr. Wines, the President of the Conference. An odder row has probably never marked the proceedings of a philanthropic body, especially when we consider that it was instigated by the Governor of a State. The most comic feature in it was the flight of the quack doctor, who quitted Louisville in the middle of it—"phenomenal cures," "miraculous powers," and all—as soon as the fight grew warm.

Butler's strange infatuation for his "tanned human skin" issue has received another shock. It was shown long ago that the specimens which he exhibited as evidence of the horrible uses to which the bodies of paupers were put by the people of Massachusetts, never had any other origin than the freakish desire of a medical student to see what kind of leather the human skin would make. There was no evidence that the skin used had been taken from a Tewksbury pauper. Yet Butler goes on talking about it, circulating campaign documents with pictures of it, and even printing a Republican ballot on paper which is colored like it. He also paraded before the investigating committee a shoe which he said was made of human skin. The firm of tanners from whom the Governor obtained all his "samples" now come forward, and say that he is wilfully misrepresenting the facts about them, and that "there is no more human skin about the Tewksbury shoe than there is about a buffalo robe," it being made of dogskin. Yet we doubt if Butler will abandon his "issue" even now. It is about all he has, and he has succeeded so well in the past by appealing to the prejudices of

the lowest and most ignorant voters that he has little faith in any other kind of campaigning.

The renomination of Mr. Low as Mayor of Brooklyn has doubtless been assured by the action of prominent citizens of all parties last week. About 150 of them met informally, and, after expressing approval of the Mayor's administration, sent a committee to ask him if he would consent to a renomination. He replied that if a renomination were offered him by citizens, irrespective of party and with the same understanding as that on which he was nominated two years ago, namely, that he should be under pledge to no man or set of men, he would consider the offer an honor which it would be his duty to accept. A mass meeting has since been held, on Saturday, when he was renominated by acclamation. After this it is expected that the Republicans will formally approve the nomination, and it is believed that his re-election will follow without difficulty. The experiment in self-government which the citizens of Brooklyn entered upon two years ago will thus become an established success. Mr. Low has succeeded in the difficult task of keeping his administration completely aloof from political alliances of all kinds, and has given Brooklyn the purest and most genuinely economical government which it has had for years.

The despatch of General Pryor to Liverpool last week, for the purpose of defending O'Donnell for the murder of Carey, is a good specimen of the way in which the money of the patriotic Irish in this country is spent. A very large amount of it goes in travelling expenses of orators who want a trip to Europe. In this case the malversation really lies on the surface. The only justification for the despatch of American counsel to take part in O'Donnell's defence would be the probability that it would increase the chances of an acquittal. But there is and can be no such probability. It is all but certain that the English courts will not allow General Pryor to open his mouth in court, because he is not a member of the English bar. If he were permitted to speak he would be addressing an English jury, that is, an audience of whose mental and moral peculiarities he has no knowledge, and whom his very appearance and manner, and, above all, the circumstances of his retainer would prejudice against him at the start. He and his employers are probably both well aware of this, and if he were allowed to appear would expect nothing from him but a stump speech about the wrongs of Ireland, which would ensure O'Donnell's conviction. The prisoner's greatest misfortune just now is his having friends on this side of the water.

The Edmunds bill is acknowledged to be a complete failure as far as the suppression of polygamy in Utah is concerned, and the attachment of the Mormons to the institution appears to be unabated. At the recent Church Conference in Salt Lake City, the speakers strongly commended it to the support of the faithful, and rebuked the faint-heartedness and lukewarmness of those who were frightened by the recent Congressional legislation into sending away some of their wives. The Church has eighty-one missionaries at work here and in Europe, and reports great progress. It now numbers 127,294 members and 23,000 families. Probably the greatest impediment in the way of dealing with it energetically is the condition of popular sentiment about the marriage contract in nearly all parts of the country. In a community in which divorce is so easy and so frequent the indignation against polygamy does not, in spite of all that is said in Congress, easily become a consuming fire. In fact, as long as we tolerate a man's having so many wives in rapid succession, all attempts to frighten those who prefer having them all at once, must be rather lame and impotent. To the Mormon women the difference between the two systems must really seem a question of taste or convenience rather than one of morals.

A statement prepared by Director Burchard shows that 123,447,480 ounces of silver have been bought by the Government since the Silver Bill went into effect. Of this amount 119,206,224 ounces have been coined into silver dollars, and the remainder (less waste) has been used for subsidiary coins. The loss on waste has been $51,925, and the amount paid in wages for coining (which is likewise waste) $71,429. There has been an apparent profit of $15,581,713 on the coinage; but this profit is a matter of bookkeeping merely, consisting in an imaginary difference between the cost of the bullion and the legal-tender value of the unused coin. If the bookkeeping took account of the present value of the coined metal, it would show an enormous loss, the market price having declined steadily ever since the Government's purchases began. It is not to be supposed that another session of Congress will pass without a general debate on the silver question. The position of the Government in regard to it is wholly anomalous and unprecedented. No country since the world began ever bound itself to buy and convert, at its own expense, a given amount of metal into coin in a given time, and to continue the process indefinitely. Whatever may have been the reasons for adopting such a policy five years ago—and we do not care to enter into them now—they have ceased to operate.

We notice that in the reports of the Episcopal Convention in Philadelphia an English bishop, the Bishop of Rochester, who happened to be present and addressed the Assembly, is constantly spoken of, in distinction from his American brethren, as "the Lord Bishop." That this is ridiculous is, perhaps, the least objection to it. An English bishop is not spoken of at home, either in the press or in society, as "the Lord Bishop," except on some very formal occasion, but plainly "the Bishop of So-and-So." He is addressed as "My Lord," or "My Lord Bishop," not because he is a bishop, but because he has a seat in the House of Lords. Every thoughtful man in England, however, admits that it would be far better for him and the Church if he had no seat among the Peers and was not a lord. It would be perfectly proper and very desirable, when he is over here, where he is simply a bishop, to drop the lordship altogether. At all events there is no occasion to make more of it than Englishmen themselves make. "The Bishop" will do perfectly well as a title for the Bishop of Rochester, and all good churchmen must feel that he cannot have a higher one.

The Virginia Readjusters tried their best argument on a colored orator at a Republican meeting last week, through a Readjuster leader named "Sam" Gregory, known to local fame as the son of the Rev. "Joe" Gregory. The colored orator was first interrupted by Sam with insolent questions, and made replies which were so apt that Sam shot him on the spot. Sam and his father then took to the woods, and have not been seen since. The progress of the Republican canvass in that county has been arrested, and the chances are that the Readjusters will have the argument all to themselves for the rest of the campaign. Deep gloom over the affair doubtless prevails among the Rev. "Joe" Gregory's friends.

The English Postmaster-General, Mr. Fawcett, makes the welcome announcement that the present unsatisfactory method of despatching the American mails from England will not be continued upon the expiration of the existing contract in August of next year. The American plan of sending them by the fastest steamers, without regard to the company to which they belong, will be adopted after that date. This will not only materially shorten the average time of transmission, but will also have the effect of bringing the mails in here at regular intervals and in regular order. At present it often happens that the mails for an entire week are poured in on a single day, and not infrequently the later dates arrive a day or two in advance of the earlier ones, thus causing great inconvenience and confusion.

The passion occasionally displayed by quiet preachers and literary men for the ferocious use of military force against people whose ways they disapprove of is one of the mysteries of human nature. Men who seldom quit their libraries, and have not nerve enough to see an arm amputated, are sometimes found advocating the most bloodthirsty courses against their particular set of heathen. Carlyle and Froude are the two most conspicuous instances of this literary thirst for blood. Froude has always approved of having plenty of Irishmen put to the sword or tortured, while Carlyle was disposed to apply the same remedy to poor men of all races, beginning with the "niggers." Mr. Goldwin Smith also desires liberal gibbeting and shooting in Ireland. The Rev. Howard Crosby, also a quiet student, a year or two ago, if we remember rightly, was disposed to try the sword on the Mormons, and now the cruel and blatant Doctor Talmage, of Brooklyn, wants to have General Sheridan sent out to slaughter them all, as the only way of putting down polygamy, and strongly urged this policy from his pulpit

last Sunday. If he is wise, however, he will drop this view, because if the practice of suppressing disagreeable people by "the sword" should ever creep into American life, he himself would certainly perish by violence. Thousands in this city already favor the use of the army against him, and are only restrained by that general peaceableness and humanity of the American character which he is trying to break down.

The Ministerial confusion in Paris continues, and the importance of the Alfonso incident is daily becoming more apparent. France has for ten years been looking about for an ally to aid her against Germany. She lost all hope of Austria very early. The Russo-Turkish war and the Nihilistic troubles have made Russia a very uncertain reliance. She alienated Italy by the Tunisian expedition. She has almost quarrelled with England over Egypt and Madagascar. Spain alone remained as a possibility, and now all chance of Spain is gone, for the Paris mob have thrown her into the arms of Germany. A Spanish alliance is desirable to France rather on account of the damage Spain could do as an enemy than the assistance she could render as a friend. In a war the Spanish fleet, in combination with the German, could give the French fleet all the work it needed, and, although a Spanish army might not be able to invade France, it could keep 100,000 Frenchmen watching the passes of the Pyrenees when they would be sorely needed on the Rhine.

The Pope's latest allocution contains no indication of any reconciliation with the Italian Government. He keeps up the wail which has been issuing from the Vatican about the state of the Church and the world ever since 1848. He is apparently not a whit more cheerful or hopeful than Pius IX., although undoubtedly a good deal more prudent and sensible. The continuance of the lamentation over the loss of the temporal power, and the steady refusal to acknowledge in the smallest degree the legitimacy of the new rule in the old Papal dominions, is becoming fast one of the puzzles of European politics. People find it impossible to believe that as astute observers as the Pope's advisers expect a restoration of the temporal power, but they also find it impossible to guess what they are driving at in keeping up the assertion that it is necessary to the Church's efficiency. Money is undoubtedly obtained more readily from the faithful by these lamentations, but a larger and surer income might be got from giving them up and coming to terms with King Humbert. Moreover, it is not, and probably never will be, an article of faith that the successor of St. Peter must be a petty prince. On the other hand, curiously enough, it is stated on very good authority that Humbert believes himself to be the last King of Italy, and looks forward to seeing his son living in a republic, and has educated him with that possibility in mind.

The Comte de Paris is now acknowledged as the head of the House of France by all the leaders and spokesmen of the Legitimist party in France—dukes and duchesses, Vendean generals, priests, orators, and journalists—but he is not by "Princess Amélie," her three brothers, the "Princes de Bourbon," and their venerable mother. On the contrary, all these personages have solemnly protested in Paris journals against the assumption by the grandson of Louis Philippe of a dignity which, as they asseverate, and have been asseverating for so many years, does not belong to him, but to "Princess Amélie's" oldest brother, "the son of Louis XVII." This "genuine Louis XVII.," their father, was in his best years known as an honest and diligent German-speaking watchmaker — Karl Wilhelm Naundorff by name—of the Prussian town of Crossen, on the Oder, though he occasionally revealed himself in his royal character, relating (as many other humble claimants to the throne of France did in his time), his flight from the Temple, and also addressed himself for recognition to the Duchess of Angoulême, the daughter of Louis XVI. and Marie Antoinette, and as such his "sister." After the fall of the Bourbon throne in 1830, he repaired to France, where he found many believers in his story, owing to his strikingly Bourbonian features, and entered into negotiations with Louis Philippe, offering to acknowledge him as king if he were himself recognized as royal prince. After some years he was arrested, tried as a false pretender, and eventually expelled from France. He died in 1845 in the Netherlands, where he met with recognition in high circles, and where his eldest son, an officer in the Dutch army, succeeded him as pretender. His daughter married a Frenchman of the non-princely name of Abel Laprade, but has since constantly figured at the expiatory commemorations in Paris, on January 21, of the execution of Louis XVI. In 1873, when the Comte de Chambord came near ascending the throne of his grandfather, Charles X., the Naundorff-Bourbons began a suit against him in the Paris courts, as a usurper under false pretences, but their effort proved futile. They now declare his successor of the House of Orleans to be a usurper of the same stamp, and offer to "redeem France from her deep degradation," if their right is acknowledged.

There has been another revolution or quasi-revolution in Bulgaria, the Prince having at last thrown off the Russian influence under which he has acted ever since he ascended the throne of the Principality. His inaugural address gave offence to Russia by its failure to pay her a fitting tribute of gratitude for the deliverance of the country. But his first cabinet was not unfriendly to that Power. It was conservative, and soon excited the wrath of the Assembly, which was swayed by the Radicals and Propagandists. The Prince first modified it, and then replaced it by a coalition ministry, of which the liberal "patriot" Zankoff, the more radical Karaveloff, and the Russian General Ernroth were the foremost members. Alexander incurred unpopularity by taking the part of his Moslem subjects against their Christian oppressors, and was more and more pushed into the shade by his native ministers. Galled by ministerial usurpation, factious partisanship in the Assembly, corruption in office, and Panbulgaric demagogy, he carried out, in the summer of 1881, with the help of Ernroth and other Russian officers and the sanction of a packed extraordinary Assembly, a *coup d'état*, which gave him an almost undisguised dictatorship for seven years. The fundamental laws were modified and rendered less democratic. Zankoff, Karaveloff, and other opponents were imprisoned, banished, or otherwise silenced. But the agitation against the Prince and his Russian tools could not be suppressed. He in vain sought rest, and perhaps safety, in frequent journeys to St. Petersburg and other capitals, and in vain formed a new ministry in July, 1882, in which, however, Russian generals, Soboleff and Baron Kaulbars, received the leading posts. The popular animosity against the foreign ministers and officers of the national army was fanned to a dangerous pitch, the Russians lorded it over the Prince himself, and some of them intrigued behind his back with Zankoff, with the conspirators of Eastern Rumelia, and even with Nihilist plotters.

In the beginning of 1883 the situation became intolerable. The Prince had been in St. Petersburg during the explosion in the Winter Palace, again shortly after the assassination of Alexander II., and a year later; he now accompanied Alexander III. to his coronation in Moscow, but he returned with thoughts of self-emancipation from Russian tutelage. He was suspected of meditating an entry into the Austro-German alliance. Soboleff and Kaulbars now persuaded, or forced, him to recall Zankoff and convene the Assembly. But the Bulgarian ex-Premier had views and plans of his own. Scarcely had he returned to Sophia when he entered into a coalition with the leaders of the Conservative party, aiming, it was stated, at the reëstablishment of the Constitution and the supplanting of the Soboleff-Kaulbars Cabinet. At this critical juncture the Russian envoy, M. Yonin, interfered most energetically, demanding the maintenance of the Russian ministers in office. The Prince announced in a manifesto his determination to have a new Constitution elaborated by a commission, and laid before a constituent Sobranye. He then opened, on September 16, an extra session of the regular Assembly. The latter, however, emphatically declared for the restoration of the Constitution of 1879. The popular excitement became threatening. Prince Alexander yielded to the clamor—perhaps not unwillingly—promised a speedy return to the constitutional régime from which he had departed in 1881, dismissed his Cabinet, and intrusted Zankoff with the formation of a new one. This task has been accomplished, and, according to a telegram of September 27, the Russian generals have left the Bulgarian capital for St. Petersburg. An exodus of subordinate Russian officers in the Bulgarian army had begun earlier. The official press of St. Petersburg expresses indignation at the change, which has all the appearance of a revolt against Russia.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, October 3, to TUESDAY, October 9, 1883, inclusive.]

DOMESTIC.

STATE elections were held in Ohio and Iowa on Tuesday. The returns so far received from Ohio make the result doubtful. The vote was very heavy. Each party claims that its candidate for Governor was elected, but the indications now favor the Democratic candidate, Mr. Hoadly. The prohibition amendment received a large vote, and its friends assert that it was carried. In Iowa Mr. Sherman, the Republican candidate for Governor, was reëlected by a plurality estimated at from 20,000 to 30,000.

The Massachusetts Independents have issued an address to the people of that State, in which they say: "We deem it unwise at the present juncture to nominate a candidate for Governor, and we recommend those who sympathize with us to support the Republican candidate, recognizing in George D. Robinson integrity of character and unquestioned ability, which give better promise of good government than the vicious methods and personal ambition of Benjamin F. Butler. But we feel it our duty to withhold our support from the Republican candidate for Lieutenant-Governor, regarding his nomination as unworthy of the approval of those who wish to condemn the present Executive and all which he represents."

General Mahone took the stump for the Readjusters in Virginia on Wednesday, and delivered a speech arraigning the Democratic Funder party.

The Treasurer of the Republican State Committee of New York has prepared a circular asking for voluntary contributions toward the legitimate expenses of the campaign. There is nothing in the circular violating the letter or spirit of State or Federal laws.

A great many Senatorial nominations were made during the week in the various districts of this State.

A meeting was held in Brooklyn on Wednesday evening to take steps for securing the reelection of Mayor Low of that city. A committee was appointed to arrange for a mass meeting in his favor. On Saturday evening Mayor Low was enthusiastically renominated by a large meeting in the Brooklyn Academy of Music. The meeting was non-partisan.

Ferdinand C. Latrobe was nominated for Mayor of Baltimore on Wednesday. There are charges of fraud in the primaries, and a split in the party is imminent.

Fred Douglass has written a letter saying: "I can have all the independence I want inside the Republican party."

The Free-Trade Conference at St. Louis adjourned on Wednesday. There was a long debate between some of the members, who insisted upon absolute free trade, and others who favored an attempt to eliminate protection as the first step. The latter opinion prevailed. An address to the people was adopted, declaring that protection was a ruinous measure, and that all possible means should be taken to abolish it immediately. A literary bureau was agreed upon to furnish free-trade matter to the press generally, but more especially to country papers.

At Albany on Monday the case of Loren B. Sessions, charged with bribery, was called in the Court of Oyer and Terminer. During the Senatorial deadlock of 1881, when Roscoe Conkling and T. C. Platt were trying to get back into the United States Senate, Assemblyman Bradley was voting for them and Sessions was voting for other candidates. One morning Bradley astonished the Legislature and the public by rising in his place and proclaiming that Sessions had offered him $2,000 if he would change his votes from Platt and Conkling to Chauncey M. Depew and William A. Wheeler. Only six jurors have so far been obtained.

The Star-route case against ex-Senator Kellogg is set down for a hearing in Washington on December 10. The urgency of the Government counsel did not avail to secure an earlier day. The criminal branch of the court is crowded with cases that must first be heard.

President Arthur has returned from his vacation trips to Washington, and is now residing at the Soldiers' Home.

It is reported in Washington that the Secretary of War, in his annual report to Congress, will recommend that the appropriation for militia be increased from $200,000 to $600,000, and that the apportionment be made on the basis of 600 militia for each Congressional district.

Lieutenant Ray, commanding the Point Barrow expedition, telegraphed to the War Department on Sunday from San Francisco: "I report my safe arrival to-day with party; also brought down Lieutenant Schwatka and party from St. Michael's. All work accomplished as ordered by Chief Signal Officer. Pendulum observation not made. *Leo* reached Ooglaamie August 22; was driven away by ice the same night; returned on the 24th; again driven away and damaged on the 25th; returned on the 27th, when party and stores were embarked. Sailed on the 29th. Vessel leaking badly; put into Oonalaska, where she was beached and repaired." This was the companion expedition to the one under Lieutenant Greely, and was sent out by the United States Government, sailing from San Francisco on July 18, 1881. The original design of the expedition was to create a permanent signal station at Point Barrow, and to remain until the summer of 1884. The order to return was a surprise, as the work was being successfully carried out. Lieutenant Ray says the station, Ooglaamie, is a needed refuge for the crews of whaling vessels.

Lieutenant Schwatka, in relating the work of his party, said they started from Fort Vancouver, W. T., on May 21, being detailed by General Miles, commanding the Department of Columbia, to make an exploration of the valley of the Yukon. They travelled 2,800 miles overland, reaching the headwaters of the river, where they constructed a raft of logs to navigate the stream to its mouth. They procured a crew of six Indians, and proceeded down the gradually increasing stream within 250 miles of Fort Chilcat, where rapids were encountered and run. The voyage on the raft was 1,829 miles from the mouth of the Yukon. They proceeded to St. Michaels, where they boarded the *Leo* for San Francisco. Lieutenant Storey reports the discovery of an immense river in Alaska, supposed to be more than 1,500 miles in length.

At the annual meeting of the trustees of the Peabody Education Fund in this city, on Wednesday, it was reported that the distribution of the income of the fund since October 1, 1882, had been as follows, the items to which it was applied being public schools, institutes, scholarships, colleges, universities, and the *Educational Journal:* Alabama, $5,775; Arkansas, $4,050; Florida, $2,925; Georgia, $5,900; Louisiana, $2,125; Mississippi, $4,400; North Carolina, $8,350; South Carolina, $4,225; Tennessee, $12,600; Texas, $13,600; Virginia, $4,125; and West Virginia, $3,100, making a total of $71,175.

A number of successful celebrations of the first settlement of Germans in this country, at what is now Germantown, Pa., 200 years ago, were held in Philadelphia, Newark, N. J., and other cities, on Monday.

Wednesday, the second day of the semi-centennial celebration of the founding of the New York Anti-Slavery Society, was occupied, at the Broadway Tabernacle, in this city, in relating reminiscences of the old anti-slavery struggle. Among those present was Mr. Henry Tanner, who saw the Rev. E. P. Lovejoy killed by the pro-slavery mob at Alton, Ill., in 1837. Mr. Oliver Johnson paid a tribute to the part American women took in the work.

The General Convention of the Protestant Episcopal Church of the United States continued its sessions in Philadelphia during the week. The Bishop of Rochester, England, was present and made several addresses. On Tuesday a motion was made to strike from the title of the Book of Common Prayer the words "Protestant Episcopal" and insert "Holy Catholic." It was lost by a vote of 21 to 252.

The Rev. Dr. Ewer, of St. Ignatius Church, in this city, was stricken with paralysis while preaching in Montreal on Sunday. His physicians have given up all hope of his recovery. He is well known for his ritualistic practices. In 1868 he attracted much attention by a series of sermons on the "Failure of Protestantism."

The fifty-third semi-annual Conference of the Mormon Church met in Salt Lake City, Utah, on Friday. President John Taylor made an address encouraging the practice of polygamy, notwithstanding the Federal laws.

The Trustees of Lafayette College, Easton, Pa., have elected the Rev. J. H. M. Knox, D.D., of Bristol, Pa., President, to succeed Dr. Cattell, resigned.

The fifty-second annual exhibition of the American Institute was opened in this city on Wednesday.

The fine buildings of the Pittsburgh Exhibition were burned on Wednesday morning. The total loss on buildings and exhibits was about $1,000,000.

At a meeting of the trustees of the East River Bridge of this city and Brooklyn on Monday afternoon, the Treasurer, Otto Witte, reported that the receipts from foot passengers up to October 4—nineteen weeks from the bridge opening—were $34,464, from vehicles $31,563, and from cars $3,936. The average was $526 04 a day, and the total receipts were $69,163, while the expenses were $51,418 08. Superintendent Martin reported that the total number of pedestrians crossing the bridge from New York up to October 1 was 1,865,800, and from Brooklyn 1,519,600, making 3,385,400 in all.

The Commissioners of Accounts in this city, Messrs. Shearman and Hill, have submitted to Mayor Edson their report on the Carroll coupon frauds in the Finance Department. They say that Carroll's guilt appears to be established beyond a doubt, and they recommend a radical change and reorganization of the department.

A robber on trial in West Virginia has made a confession exposing the workings of a gang of outlaws who have overrun the mountains and interior of that State for several years, engaging in all sorts of crime. They were specially banded together for the protection of illicit distillers from Government officers. They were called "Red Men."

Four persons were killed and eleven injured in Philadelphia on Friday by the wrecking of a street-car by a train on a steam railway. The driver of the car also acted as conductor, and was engaged in taking the fares at the time of the accident.

The recently elected Board of Directors of the Northern Pacific Railroad Company met on Saturday in this city, and reorganized by the reëlection of all the former officers of the company, with Henry Villard as President. The most important business transacted at the meeting was the unanimous adoption of a resolution authorizing the issue of $20,000,000 second mortgage bonds.

Gen. A. P. Ketchum, Appraiser of the Port of New York, having been charged with violating the civil-service rules, has made satisfactory explanations of his actions.

Rear-Admiral Joshua R. Sands, of the United States Navy, retired list, died at Washington on October 2, aged eighty-nine.

Juh, the famous Apache chief, is reported

to have been drowned on September 21 while intoxicated. Little Charles McComas, the abducted white boy, is said to be alive and well, with the band.

FOREIGN.

For a time the relations of France and Spain remained in a very strained condition. On Wednesday there were rumors that Prime Minister Ferry of France had tendered his resignation to President Grévy, and that it had been refused. Great confusion was reported in the Ministry. It was also asserted that the German Government had addressed an energetic note to France concerning the treatment of Alfonso, but this was not confirmed. A slight conciliatory action on Wednesday was an order from King Alfonso to the Spanish Ambassador in France to distribute 10,000 francs to the poor of Paris. On Thursday it became generally known in Paris that illness was not the cause of the absence of General Thibaudin, Minister of War, from the reception given to King Alfonso at the Palace of the Elysée. He voluntarily and ostentatiously held aloof from the dinner. Prime Minister Ferry then thought himself bound to inform President Grévy of the deplorable effect of M. Thibaudin's conduct in political circles and upon European opinion. M. Ferry, who was backed by all the Ministers, declared that General Millot should never, with his consent, become Chief of the General Staff, as the whole army acknowledged that he was unfit for the post. An investigation was ordered on Thursday into the causes and authors of the insults to King Alfonso. Emperor William, of Germany, telegraphed his sympathy to the King. It was announced on Friday that President Grévy had instructed M. Ferry to ask Gen. Thibaudin to resign; that the General had resigned and that the President had accepted the resignation. The Spanish Ambassador to France made "courteous verbal representations" to M. Ferry asking for the punishment of the authors of the insult to the King. He was also instructed to remind the French Cabinet of President Grévy's promise to publish his apology in full. The reply of France to all the representations of the Ambassador was such that an agreement was rendered easy. The excitement soon began to subside in Madrid and Paris.

On Tuesday it was reported from Madrid that the public were impatient for a settlement of the difficulty. Señor Sagasta will probably soon reconstruct the Spanish Cabinet. He is negotiating with the Left for the admission of representatives of that party into the Cabinet. It was officially announced in Paris on Tuesday that General Campenon had been appointed Minister of War to succeed General Thibaudin.

M. Wilson, the son-in-law of President Grévy, has been accused of having abetted the movement against King Alfonso, and also of having used state secrets in his newspaper, the *Petite France*.

It was asserted in the columns of the Paris *Figaro* on Wednesday that M. Tricou, the French representative in China, had telegraphed the Government that no serious preparations for war were being made in China. He said the idea of a war with France was badly received in the southern provinces, and was repudiated by the Council of the Empire, and that China could muster only 20,000 troops, with European arms, for service in Tonquin.

An official despatch from Hong Kong, dated September 30 and received in Paris on Saturday, said that Admiral Courbet had had a conference with the French civil and military chiefs in Tonquin, who agreed that active operations are impossible at present, owing to the bad condition of the roads. They were also of the opinion that the troops now in Tonquin could safely await the arrival of reinforcements. A telegram was received at Paris on Monday, asserting that the Black Flags have recreated from Namdinh and Sontay to Laokai, on the frontier of China, and that Anamite envoys have arrived at Haiphong, and will start for Hanoi, the French headquarters, forthwith.

It was reported in Paris on Tuesday that Colonel Badens, commanding the French forces from Hai-phong, had had an engagement with Chinese regulars at Bac-ninh, resulting in a defeat of the Chinese, and that the French gunboats would intercept their retreat. This despatch probably refers to the movements of Colonel Badens from Hai-phong mentioned in the Canton advices of October 1, stating that Colonel Badens started on the 29th of September from Hai-phong with 350 French troops by way of the Tai-binh River for Bac-ninh. If the reported defeat proves to be well founded, the French have captured one of the most important strategic points in the Delta. An official despatch from Saigon says the situation of affairs in Tonquin has much improved, owing to the presence of the Anamite envoys and the submission to French authority of the Delta Mandarins.

The natives in Canton remain quiet, but the Europeans have prepared a plan of defence for their quarter.

Madagascan advices assert that the French garrisons at Tamatave and Majunga are virtually blockaded. British merchants engaged in trading with Madagascar are forwarding to Lord Granville, British Secretary of State for Foreign Affairs, claims against France for damages because their goods are not allowed to be landed at Tamatave.

An infernal machine exploded at Lyons, France, on Monday, and damaged the Town Hall. It is generally believed that revolutionists did the work, with a view of creating public alarm.

At a meeting of citizens in Cork £250 has been subscribed toward a fund for the erection of a national monument to the late Father Burke, the well-known Dominican priest.

The Emperor William of Germany has sent to Herr von Schilling, the sculptor of the Niederwald monument, an autograph letter conferring upon the artist a decoration, and enclosing a gift of honor of 30,000 marks ($7,500).

It is reported that an Invincible Vengeance Committee has been formed in Ireland to hunt down all informers. The Committee has paid spies throughout the British colonies and in North and South America.

The trial of O'Donnell, the slayer of James Carey, has been put down for October 15. His counsel has asked for a postponement until November, which it is believed will be granted.

Joseph Smith, Joseph Hanlon, and Michael Kavanagh, informers in the Phœnix Park murder trials, landed at Marseilles on Thursday and then disappeared. It is reported that they will go to India.

An Orange procession, while returning from a meeting in Belfast on Saturday, at which Sir Stafford Northcote spoke, was attacked by a Catholic mob. A desperate fight ensued, and many persons were wounded.

The *Moniteur de Rome*, which is understood to reflect the Pope's views, deprecates the aggressive attitude of Orangemen in Ireland toward the National League.

The Cesarevitch Stakes were won at the Newmarket, England, races, on Tuesday, by Mr. G. Lambert's three-year-old chestnut colt, Don Juan.

The Mayor of Stratford-upon-Avon having refused his assent to the proposed exhumation of Shakspere's bones, the matter has now been settled by a vote of the Town Council, which has passed a resolution condemning any disturbance of the poet's grave.

It is asserted in Berlin that Nihilist proclamations have been issued solemnly sentencing the Czar of Russia to death because he has failed to grant liberty to his people.

M. Turgeneff, the Russian novelist, was buried in St. Petersburg on Tuesday with great honors. Thousands of people followed his body to the grave.

The Paris *Gaulois* gives currency to a report that Russia is about to contract a loan of 100,000,000 rubles.

General military works have been constructed in the neutralized part of Savoy by the French. The Government of Switzerland will make an energetic protest against this breach of treaty obligations.

At the meeting in Neufchâtel, Switzerland, on Sunday, to demand of the authorities the expulsion of the Salvation Army from the country, 2,000 persons were present. A resolution to that effect was adopted. The Councillor of State said that the body to which he belonged would do its duty, and close the gates of Switzerland to those who were trading upon her hospitality.

The Pope, in an allocution upon receiving a large number of Italian pilgrims in the Basilica of St. Peter's at Rome on Sunday, said he rejoiced to witness the concord existing between the clergy and their flocks. The conspiracy of sects had reduced the Papacy to a condition unworthy of its rank. The historical researches of learned men proved that the Papacy was no enemy of Italy, but that it had always been actuated by sovereign benevolence. True civilization derived from the Papacy increased vitality and strength. The real object of the sectaries in depriving the Pope of temporal power was to strike a blow at the Church and rob Italy of the treasure of faith. To avoid the extinction of Catholicism, it behooved all patriotic and religious forces to unite and show themselves openly as Catholics, and to desire, above all things, to restore the Pope to that condition of liberty and independence which is his due.

The Supreme Tribunal of Norway having impeached the whole Ministry of the country, their trials began on Thursday with the case of the Prime Minister.

The negotiations between United States Minister Wallace and the Porte concerning the storage of American petroleum and upon the tariff question are proceeding favorably at Constantinople. Concessions have been made by each side.

Simon Camacho, late Minister at Washington from Venezuela, died on September 20 at Caracas, Venezuela. He had been in poor health for some time, and sailed for his home in March last, hoping to regain it. He was a nephew of Bolivar, the Liberator.

Mail advices from South America report that peace reigns in the interior of the United States of Colombia, and that it is believed a revolution has been averted. From Peru it is announced that Montero's power continues to wane, although his friends still laud him as a General, Admiral, and President, and he declares that he will fight to the death. He is almost without support, and it is hoped the townspeople will depose him from authority and join Iglesias. A despatch on Tuesday announced that Casma, the principal seaport town in the department of Ancachs, had declared in favor of Iglesias and peace.

A letter received from Stanley, the explorer, by a friend in Boston, says: "Since I arrived on the Congo last December I have been up as far as the equator, and have established two more stations, and, besides discovering another lake, Mantumba, have explored, for a distance of 100 miles or thereabouts, the river known on my map as the Kelembu, but which is really the Malumdu. It is not as large as I stated in my book, but is a stream of the size of the Arkansas, and is deep, broad, and very navigable. The big streams, which, I expect, must drain the largest part of the South Congo basin, must be higher up."

THE PUBLIC LANDS.

Mr. Samuel J. Randall, in his Ohio campaign speech on Saturday, made an attack upon the Republican party on the ground that it had squandered the public lands in a reckless and unprincipled manner. He said that all acquisitions of territory by the United States had been the fruit of Democratic policy, while all schemes for giving away land to corporations and speculators had been the result of Republican policy

Acquisitions of territory made before the Republican party came into existence obviously have no political significance now. The most that can be said upon this point is that if the Republican party had existed at the time when Texas annexation and the war with Mexico were on foot, it would have opposed both those transactions as part of the slavery propagandism of the time. The only acquisitions of territory made under Democratic auspices during the memory of the present generation were made for the purpose of extending slavery. If they have answered other and better purposes, they have so far transcended the intention which prompted the acquisition.

It is true that the bulk of the railway land grants were made after the Republicans came into power and while they were in power. But the first one—that of the Illinois Central Railway—was made before the Republican party existed, under the administration of Pierce and the leadership of Douglas. The policy was established under Democratic auspices. It was discontinued years ago, under Republican auspices. If it was a good policy, the Democrats are entitled to the credit of having initiated it. If it was a bad one, the Republicans are to be congratulated upon having discontinued it. The most that can be said in favor of it is that it has led to the settlement and cultivation of large tracts of land at an earlier period than they would have been settled otherwise. The most that can be said against it is that it has added something to the price per acre to the settlers. Mr. Randall's idea is that these land grants were passed for a corrupt purpose, and that they resulted in enriching the grantees at the expense of the rest of the community. There is very little, if any, evidence that the land grants were passed under the influence of corrupt motives. They were believed to be needed to "develop the resources of the country." In this belief both parties shared alike, and both were in accord with public sentiment at the time. It is not true, however, that the recipients of the land grants were enriched by them. Nearly all the railway companies thus endowed went into early bankruptcy, the Illinois Central being foremost in the list. The Union and Central Pacific were saved from bankruptcy only by their money subsidy. The Kansas Pacific became insolvent in spite of the money subsidy. The Northern Pacific was insolvent from 1873 to 1879, and its chief promoters were brought low. The land-grant railways of Wisconsin and Minnesota went through two or three periods of bankruptcy, and probably ruined more people than they ever enriched. Here and there may be found a company which really made something for its early investors out of its land grant, but they are only exceptions to the rule.

There is no question before the people now respecting land grants. By common consent the policy has been abandoned. The homestead law enables any citizen to acquire 160 acres for the mere trouble of settling upon and cultivating it. If settlers still prefer, as they generally do, to go upon the railroad lands and pay the price asked for them, the fact proves that, in the judgment of the only persons whose opinion is worth anything, the conveniences offered by railway transportation are more than an offset to the cheapness of other lands destitute of such advantages. If there were any question of land policy now before the people, it would be a very different one from that which Mr. Randall raises The amount of arable land in the United States not yet brought under the plough is a measurable quantity: we no longer speak or think of it as boundless. Nearly all of it has been explored and its resources roughly calculated. Regarded as the heritage of the poor man—the American poor man—it will suffice for fifty years or more. By this we mean that there will be shelter and means of subsistence on our unsettled domain within reach of all persons now in the United States, and of their children, who can find no other employment, for at least half a century. That which will be sufficient for our natural expansion fifty years will not suffice more than thirty years for the tide of immigration from the Old World added to our own westward drift. Yet there are probably not ten persons in the United States who would think of putting any restriction upon the settlement of our unoccupied lands by foreigners, always excepting the Chinese. Breaking up the western sod and grubbing the thicket and putting in the first crop is a toilsome and lonesome task, and one which we are quite willing to resign to the natives of Germany, Norway, and the British Isles, in full confidence that we shall get a share in the resulting harvest. Yet we must look forward to a time when the last available acre shall be under cultivation, and when further agricultural production can be obtained only by the expenditure of more capital and labor upon the land.

In truth, there is no land question left for political parties to divide upon. Nor are there any facts in the past which give the Democrats ground for boasting superior virtue or prudence in dealing with the question. But if any Congressman—Mr. Randall, for instance—wishes to achieve reputation and establish a claim to public gratitude, he may find his opportunity in the facts disclosed in the report of Colonel Tullis, a special agent of the Government to inquire into public-land frauds, a sketch of which is given in a late telegram from Salt Lake City, as follows:

"The desert-land entry act has been violated with a recklessness that is positively astonishing. In many cases it was found that absolutely nothing had been done toward reclaiming the lands, and yet what were known and regarded as good citizens have gone before the land officers and made solemn oath that the land had been reclaimed and all the conditions of the law complied with, where, in fact, no mark made by human hands could be found upon the entire tract. Other tracts were taken up under the desert act that are no more desert than the valley of the Ohio River. Other land was found to have been taken up under the timber-culture act upon which there were growing, at the time of the original filing, more forest trees than the law requires when final proof is to be made. The homestead law has not been fairly construed, and thousands of acres have been patented by persons who have not complied with one requirement of the law, and who have given fraudulent testimony with the full intent and purpose to defraud the Government. Tens of thousands of acres of public lands are fenced off by wealthy stock-raisers, thus leaving the actual settlers without a range for their family cow. In one instance it was found that men living near a city in Montana had fenced in 3,000 acres of public lands, and permitted the townspeople to pasture their stock on the enclosure for $1 per month per head."

When the Government abandoned the railway land-grant policy and turned over every remaining acre to the poor and needy of every land under the sun, upon the trifling conditions of settlement, improvement, and culture, it left to itself no other land policy than the enforcement of the conditions. These, it appears, have been violated in the most barefaced manner, and to the great injury of actual settlers, since the violators do not obtain good title to the land—no title being good which rests upon fraud—yet get just sufficient title to prevent anybody else from going upon the land and improving it.

PERSONAL ABUSE IN POLITICS.

The Massachusetts Republicans are now troubled by a problem which has long been familiar to people in this city, if not in this State—that is, how far it is best to go in attacks on the personal character of political candidates. As a general rule, Massachusetts candidates have been hitherto so respectable, or so nearly respectable, that the practice of "handling them without gloves" has not sprung up there, or been felt as necessary as in this city, where for thirty years the frank treatment of the personal character of aspirants for office has been an absolute necessity. But now the Republicans have to deal with a man who has no opinions to be attacked, and no public character, properly so called, apart from his private character, to be criticised, and the people who do not believe in "personal abuse" are somewhat puzzled to know how to manage him. To describe Butler's career in the simplest and most dispassionate language is, however, really personal abuse. Nobody can tell the story of his life in a truthful way without offending him, or making it difficult to meet him socially without embarrassment; and yet the story of his life has to be the chief feature in Republican attacks on him. Nor is it possible to criticise his acts during his gubernatorial career without impugning his motives. To use in his defence the old argument—"he has made mistakes, as who has not?"—would excite a smile at any meeting even of his own followers, for it is well known that Butler makes no mistakes in the sense of doing things he did not mean to do. Everything he does is carefully planned.

The great, and indeed one may say the only, objection to plain speaking about a candidate of bad character, who has been nominated after his character is known, is the danger that it will

confirm in their adhesion to him people who are already committed to him. Having taken him up, of course all aspersions on him are to a certain extent aspersions on their own moral standards. They amount to saying that people who are willing to trust such a person cannot be themselves very sound, and everybody is disposed to resent anything of this kind. This accounts in part for the small effect that personal abuse in a campaign usually has on the bulk of the voters, and not only for this, but for the effect it sometimes has in increasing the ardor of a man's supporters.

The embarrassment of the Massachusetts Republicans is increased by their silence about Butler's moral shortcomings, and even condonation of them, when he was on their side. This is really his most effective defence against these attacks. I am no worse now, he constantly says, than I was from 1866 to 1876, and yet they then considered me good enough for any office I asked for. Even if I was then as bad as they say I now am, they were willing to forgive me for the sake of the service I was able to render them. Why should not the Democrats and "the poor man" now do the same thing?

A crisis has been reached, however, in the politics of the State which makes more necessary than ever before absolute plainness of speech. In fact, there ought to be no limit to it but such as truth sets. For if the majority of the voters in the State elect Butler a second time, after the experience they have had of his administration, the effect on the future of the State, financially as well as politically, cannot but be serious. It will, indeed, indicate something hardly less serious than a revolution in the Government. Under Butler the local government in Boston has already undergone a radical change, many of the worst methods of ring rule in this city having been introduced into it. Should he retain his hold on the Governorship, their rapid spread into the State Government can hardly be long postponed. And whether this revolution will come to pass depends on the answer the Massachusetts voters will now make to the question, whether they really like this kind of man in high office. This is virtually the only question in the canvass. There is no conflict of policy or opinions in the State. If the voters announce that they do like this kind of man, it will, of course, indicate the marked approximation of the State Government not to the New York State Government type — for in this State Butler would be an impossibility—but to our City Government type, in which each election consists simply in a struggle to prevent a set of shameless thieves from getting hold of the municipal treasury, and dividing its contents among themselves. No State at the North has ever been threatened with anything of this kind except Massachusetts. In the presence of such an emergency, mealy-mouthedness in describing "the old man" would certainly seem out of place.

THE TRUTH ABOUT "STOCK-WATERING."

THE Chamber of Commerce passed a resolution last week accepting the finding of the Court of Appeals that there was no law against "stock-watering," provided the "water" represented value of some kind, and asking that the law be altered so as to make the practice illegal. This was a much more sensible thing than denouncing the court for agreeing with Judge Truax and overruling the General Term, because Judge Truax is a bad man and the General Term is composed of good men. Of course if the Court of Appeals were to begin to base its decisions on the character of the judges in the courts below, as certified by the newspapers, it would have to be abolished as a farce and a nuisance. There is probably no more futile work done by the press in any community than assailing without positive proof the motives of the court of last resort because its decisions are disagreeable. A court of last resort there must always be, and this one of ours is made up as well as the manners and morals of the people of the State will permit it to be made up. We know of no process, and nobody has suggested any process, by which we can get a better Court of Appeals than the one we now have. If it cannot or ought not to be trusted, our only resource is to submit cases on appeal to the people at the polls, once a year or thereabouts. The objections to submitting them to the editors of the various newspapers are numerous and strong. A General Term or full bench of editors would never be got to agree on anything. Even a clear majority of them probably could not be obtained for any view of any legal question, because each would be, consciously or unconsciously, influenced by the consideration of the effect his decision would probably have on his circulation. A single editor sitting at Special Term would be a Court still less strong and trustworthy, because his finding in a single case might cause him the loss of some of his best advertisers, or compel him to lower the price of his paper.

But the Chamber would have done much better still if it had explained, with the authority which its utterances often have, the futility of prohibiting "stock-watering" without also providing for the regulation of charges. Nothing has done more to hinder the proper discussion of the corporation question than the hold that the term "stock-watering" has taken on the popular mind, and the constant use of it by people who have no clear idea of what they mean by it. "Stock-watering" means simply an increase in the number of shares into which the property of a corporation is divided. But the number of shares into which the property of a corporation is divided is of no more consequence to the public than its name or the size of its offices. It does not make the smallest difference to those who use a railroad or telegraph, whether it is cut up into 10,000 or 100,000 shares. But the incessant outcry against stock-watering during the last few years has convinced tens of thousands of worthy people that if a company can be prevented from raising the nominal amount of its capital as expressed in its stock, the public will somehow be the gainer by it, and the knavish tricks of the monopolists be somehow frustrated.

The result of this delusion has been, as the resolution of the Chamber of Commerce shows, that the real question involved in the anti-monopoly agitation is concealed or disguised. That question is: "Shall we regulate the charges of all corporations by law, and execute the law through state inspection?" This is the true problem which the public has to solve, but which, owing to the babble about stock-watering, is never properly presented to it. The anti-monopolists' position is, we know, that whenever a corporation increases the nominal amount of its capital stock, it tries to earn dividends on this amount, and for this purpose increases, or refuses to reduce, its charges. This may be so, but the fallacy of this position lies in the assumption that companies would lower their charges if they were not allowed to increase the number of their shares. There is not a particle of support for this notion in the history of our corporations. Companies which do not make scrip dividends simply accumulate a surplus. The banks do it and the railroads do it. The New Haven Railroad, for instance, does not water its stock, but neither does it reduce its rates. It simply pays its large profits into its treasury and lets them lie there, if it dislikes the appearance of making too large a cash dividend. The Western Union has watered its stock, but it has also largely and frequently reduced its rates. If it had not watered its stock, however, it would not have been under the slightest compulsion of any kind to give the public the benefit of its large profits. It might, and probably would, have either paid them out in cash dividends or allowed them to accumulate as a surplus.

It would do a great deal to help us to a solution of the corporation question if the term "stock-watering" could be dropped out of the discussion, and both the press and the orators could get down to the plain and simple questions: Are we prepared to limit the profits of corporations by law, and, if so, how shall we do it? Shall we fix their charges for them and thus keep their profits down by the direct action of the Government; or shall we simply take away all motive for charging high rates by prohibiting all dividends, whether cash or scrip, above a certain amount? Shall we do these things to companies exposed to competition and then compensate the existing stockholders for the loss of their legitimate expectations; or shall we protect all existing companies against further competition, as compensation for our interference with their business? Will it do, for instance, to limit the profits of the New York Central, and yet allow the West Shore Line to be built in opposition to it, or limit the profits of the Western Union, and yet allow anybody who pleases to start a rival telegraph company? It is in this way that practical men, whether politicians or merchants, should approach the matter.

THE AUTUMN MANŒUVRES.

THE great "autumn manœuvres," as they are called, have just come to a close both in France and Germany. The Germans have had nearly 70,000 men, and the French nearly 50,000, marching and countermarching for a fortnight in the presence of their respective military chiefs, as well as of a swarm of foreign officers, for the purpose both of testing the readi-

ness of the troops for war and, it must be added, of defying all enemies, known and unknown, present and to come. The foreign observers report but little change in the German army, which is simply another way of saying that it is in a state of the highest efficiency. The armament is, perhaps, not improved, and the appearance and marching of the troops remain the same as last year and ten years ago, but still, as last year and ten years ago, there is nothing like them in the world. Cavalry, artillery, and infantry have all been carried almost as near perfection as is possible in a civilized industrial community in our time. The wonderful system of mobilization under which each district turns out its division or its corps as a complete army ready for independent action, and under which every man who is to form part of it, whether actually in the service or not, knows exactly what to do and where to go when the "fierce blast of war" blows in his ears, still works with the same faultless regularity. Every regiment knows where to find its men and horses, and every man and almost every horse where to find his regiment, and everything that horse or man needs in the way of equipment is in store, ticketed and ready for use.

Against the sin which so easily besets successful armies, too—the sin of self-satisfaction, which, in the beginning of the century, ruined Prussia, and which, in our own time, came near ruining France—the Germans are constantly on their guard. No matter how well things military may seem with them, they are never well enough. Having had practical experience in 1870–1 of the enormous importance of railroads in the work of moving armies in the field, they have since then added a railroad regiment of 3,000 men to their organization, the sole duty of which is to make and destroy railroads, and to run trains on them. To keep this corps in constant training, the Government owns a railroad forty miles long which is entirely managed by soldiers. The conductors are sergeants in uniform, and all the other train men are privates. It carries passengers and freight like other railroads, but solely for the purpose of teaching the regiment how to manage a railroad in time of war. Those who are not employed on the train are constantly exercised in laying tracks and getting railroads ready for use, and also in tearing up tracks and rendering railroads as unfit for use as possible. In these autumn manœuvres specimens of everything an army can do in time of war, without injury to life or limb, are exhibited, and with what an approach to reality may be inferred from the fact that the other day an orchard was cut down remorselessly to give free passage to the artillery. There has been nothing like this in military history before. In all previous military organizations, including that of Rome, a vastly greater reliance was placed on the simple bravery of officers and men. The Germans have for the first time converted war into a business, in which valor really only plays a very secondary part. The German soldier has to be so many things besides being brave, that his bravery is hardly more thought of than that of a clerk in a commercial house. An enormous proportion of the talent of the country has in fact been drawn into the military service. It takes a very large share of the energy and ambition and capacity for administration which in other countries go into manufactures and trade and railroads and science; and the fact that there still remains in Germany so much ability for literature and science and manufactures, shows how much a good educational system does to develop capacity of all kinds, and make it visible and available.

The foreign critics report the French army considerably improved, as far as drill and appearance go, but the accounts about the discipline are conflicting. All agree that the relations between the men and the officers are not good, owing to the attempt on the part of the latter to tighten the reins of authority since the war; but some say there is but little spirit of insubordination, while others maintain that, owing to the influence of the Radical press, there is great difficulty in insuring obedience at all. There is one feeling, however, not unfavorable to efficiency which pervades both officers and men alike, and that is, hatred of the Germans. This is so intense that the German officers who have been present at the manœuvres as guests, have had to avoid contact with the soldiery as much as possible to escape insult, or at all events incivility. That the French transportation still continues defective all the critics agree, and they are further of opinion that sudden mobilization is still not possible without the risk of great confusion and disaster. In short, the conclusion to which one is forced by most of the reports is that France is still in the very inconvenient and perilous position of eagerly desiring war without being ready for it, and of having her military preparations all impeded by incessant changes both in the policy and *personnel* of the Government. The dangers of the situation, too, are aggravated by the fact that it probably does not depend on France herself whether she will fight or not. In other words, there are in the present condition of Europe many indications that she may not be able to bide her time. The air there is as full of "disquieting rumors" about war as our air of "disquieting rumors" about stocks, owing to the growing delicacy of the relations of Austria and Russia in the Balkan peninsula. Austria is steadily pushing her authority, her influence, and her railways down to the Ægean and the Bosphorus, while Russia, which is just as eager to keep a firm foothold on Turkey, has just suffered an irritating check by the revolution in Bulgaria. How long Russian patience will last is now as favorite a topic of speculation on European bourses as the intentions of Gould and Vanderbilt are here. In other words, there is a war cloud in the East, and whenever it bursts France will probably have, willy-nilly, to try of what stuff her new army is made.

THEORETICAL ENGLISH.

THE late Thomas Carlyle said of the 'Middlemarch' of George Eliot that it was neither amusing nor instructive. The same charge cannot be brought against the last number of Kölbing's *Englische Studien*, an organ for English philology, conducted with reference also to instruction in English in "higher schools." The fun is of a more subtle flavor than that which streams out of Pedro Carolino, for the gravity and sobriety of the philological methods employed are worthy of all admiration. Unfortunately, if the work of some of the contributors should fall into the hands of a classical scholar, he would be in great danger of renouncing his own investigations, appalled by the results of induction and analogy as applied to modern tongues, while the non-philological mind would simply set down as arrant nonsense the laborious process of getting at the wrong sense of an English phrase, which could be settled beyond controversy by a postal card addressed to any one born to the English tongue. But your German scholar is not satisfied with any such short process, and every one who has resided in Germany can recall the stolid front that the German mind often presents to obvious explanations, especially when the explanations are given by Americans. So a German once asked an American for the esoteric meaning of the expression "pink jail," which Dickens, in his 'Pictures of Italy,' used to describe his villa near Genoa. To the natural reply that the villa looked like a "jail," and that it was colored "pink," and that such fun as lay in the combination was to be sought in the notorious fact that jails seldom presented so gay an outside in England, the German student of English sadly shook his head. "Pink jail" was an Anglicism that no American—perhaps few Englishmen—could understand. As a rule, the German prefers to hammer out the sense of any unknown sentence in his own way, by laborious mechanical processes, or to absorb the meaning of a phrase by plunging his nature into the psychological environment of the English tongue. One must not be deceived by the modesty with which the views are sometimes put forth. Attack the result, and you will see how ignorant you are of your native language.

In this last number of Kölbing's *Studien* one of the most interesting articles—they are all interesting—is a series of observations on the language of Carlyle. It is a melancholy proof of the ovine character of criticism that Carlyle, whose knowledge of German was evidently not of an idiomatic character, and whose appropriation of German methods of thinking was very limited, should be credited, by one critic after another, with a Teutonic cast of style, simply on the strength of sundry awkward compounds. But, be that as it may, the German student of his works seems to have had as much trouble with Carlyle as if he were not the congener of the Teuton that he is supposed to be. The compounds, as one of the most noticeable features of Carlyle's style, are naturally attacked first. They are alphabetically arranged, without a hint of difference. Some of the combinations have, to be sure, found their way into the dictionary, but as "there is a possibility that they found their way out of Carlyle's writings," the conscientious collector makes no distinction, and we find "free-will," "harvest-home," "heavy-wet" ("probably a vulgarism," he adds), "high-flying," "sun-down," "heavy-laden," "hide-bound," "sky-high," in company with "world-whirlpool," "upholsterer-mummery," and "phantasm-aristocracy." "Bob-major" and "bob-minor" are set down as slang; "soft-sowder" ("Lamartine, with nothing in him but melodious wind and soft-sowder") is a hopeless puzzle.

But if the article on Carlyle errs chiefly from lack of perspective, and really serves to bring to our consciousness the mechanical effects of Carlyle's style, the article on 'Tom Brown's Schooldays' furnishes abundant illustration of the enormous difficulty of mastering the familiar life of a language from the outside; and, by the way, a curious feeling comes over one on reading these grave discussions as to the proper rendering of

all Tom Brown's schoolboy slang—a feeling of shame at finding the English language caught, as it were, in its shirtsleeves by an unlicensed foreigner—a feeling that slang ought to be kept wholly for home consumption, and not submitted to chemical analysis on foreign soil. It appears that some five years since one Doctor Pfeffer published an abridged edition of 'Tom Brown's Schooldays,' with explanatory notes for the benefit of German students of English, and now, at a somewhat later day, Otto Kares, in an unusually polite manner, takes Doctor Pfeffer to task for some of his explanations, and well he may. Doctor Pfeffer fancies that "at a day's notice" means "in the course of a day"; that "slap up" (the classical passage, "they sent him slap up to the ceiling") means "first-rate"; that "the winter's wear" of a road means "snow and ice"; that "sets in the school" has some vague reference to things in a school. The critic himself, however, often opens himself wide to criticism, and his supplementary remark to Doctor Pfeffer's note on "to knock one out of time" is delicious. This phrase Doctor Pfeffer explains as a jocose expression for "killing," and Doctor Pfeffer's critic cites as a parallel the "very common phrase" "to knock one into next week." Evidently, to both of these great scholars, "to knock out of time" is "to knock one into eternity." One of them thinks that "to go the length of" has reference to a long and tedious action; the other stoutly maintains that it involves slow and circumstantial action, and he refers to the "well-known passage" of the Christmas carol—a passage not present to the mind of the reviewer—"He went the whole length of the expression."

Of course there is another side to this. It is a shame that foreigners should be at so much pains to misunderstand our language, and that we should do so little to master the precious inheritance to which we are born. It is true that more attention is paid to English than was the case ten or twenty years ago, but the study is rather philological than stylistic, and little work is done in making grammar valuable for artistic expression. In this whole department of study the French set us and everybody else an excellent example. The practical mastery of the mother tongue ought to be the great result of every form of linguistic study in the formative stage of life. In his suggestive paper on Macaulay, in this number of the *Studien*, Doctor Thum protests against the demand of some of the leading teachers in Germany that students should take either English and German together or French and Latin together. English and French are, after all, he thinks, nearer to each other than English is to German. The etymological connection between English and German goes only a little way, and does not carry us into the wider fields of the language; and then he insists upon it that the words common to English and German are very largely modified, so as to give a French sense; *e. g.*, English *land* is much nearer in its use to French *terre* than it is to German *Land, folks* nearer to French *gens* than it is to German *Volk;* and, which is most important in the way of thinking and feeling, no languages seem to Doctor Thum so closely related as English and French. This is a point which it would not be seemly to dispute with a German. It is one that is at any rate worth considering.

FROM LONDON TO AMSTERDAM.—I.

PARIS, August 31.

THE eight o'clock train leaves Charing Cross in broad daylight, and whisks its freight through the garden of Southeastern England in the gradually deepening twilight, which becomes starlit darkness as the masses of the Dover houses rush past, and the locomotives—there are two of them—come to a panting halt on the Ostend pier. It has been impossible to speak or hear all the two hours. You have never travelled so fast. A half-scramble, half-tumble-down rickety planking brings you to the deck of the mail-packet and into Belgium. The *coup d'œil* is a veritable Turner—the flaring lighthouses; the inky water rising and falling with the diminuendo of the Channel swell; the crest of the piers cutting the topmasts of the shipping which, the tide being out, has a stranded, insignificant look; the churning of the Calais boat's paddles as she swings past and is off first. The traveller's first impulse as he looks at her wake is a jealous one; the bustle and hurry of England take possession of the faculties unperceived, and one becomes unconsciously assimilated to the prevailing notion that the essence of existence is movement. In another minute, however, the Continental tranquillity assumes its proper sway, and one is deliciously content to be slowly gliding out of the harbor in the care of Flemish phlegm, and feeling all that monotonous chaos called London, and the whole whirlpool of industrialism of which it is the vortex, fade out of the mind as the pier lanterns and bobbing lights of Dover gradually grow dim and disappear. The dawn is breaking through ribands of rose and pale green, whose momentary modulations everybody has been watching for an hour, as the boat enters the long Estacade of Ostend and disembarks her passengers. A Channel trip is not without a charm of its own. Barring accidents—that is, *the* accident—there is not unfrequently something breezy, bracing, and invigorating about it; perhaps it is partly because of the contrast between the two shores and the moral sensations one experiences on arrival at either. I do not know if it has ever been celebrated by any one save Thackeray, but he returns again and again to it, and it evidently had taken a hold on his imagination.

Certainly Ostend is as little like an English town as one could fancy; unlike those of both varieties—the commercial, and the moss-grown, stagnant, picturesque, or however one chooses to characterize such places as Salisbury, say. The grand square is full of cafés; there is a park back of the town; the streets fill with people after the siesta hour; the long promenade of the Estacade is apparently very popular; the hotel restaurant is excellent and reasonable. The shop windows are gay, within a limited range: "Souvenirs d'Ostende" in mother-of pearl, coral and conch shells, terracotta objects; statuettes from the Passage Jouffroy; colored prints of a rudeness of execution and freedom of tone which a Parisian kiosk even would not tolerate. Decidedly one is in Belgium: these prints alone are proof enough—a Catholic country of liberal ideas is attested by their moral, and a country north of Picardy by their artistic, quality. But for the sea, Ostend would be hardly worth a visit; also, without the sea it would certainly receive none. But within a few years the Digue de Mer has been built—very substantially, as all similar constructions in Europe seem to American eyes: and the crest of the long dune which separates the sea from the town is studded with new villas in a florid style, which passes for "Flemish Renaissance," and which is really vulgarized French ditto. The originality of things Flemish, from the Van Arteveldes' time down, the quality which differences them from things both to the south and north of them, is perhaps vulgarity in the last analysis—robustness, heartiness, a sort of boisterous effervescence impatient of refinement, if you choose, but, after all, neither more nor less than frankly vulgar. There is evidently, also, a corresponding comfort to be taken in these openly pretentious little boxes which one would not—I at least would not—exchange for the elegance of Trouville. As for the comfort and elegance combined, the American's reflection at all European watering-places is that there is only one Newport after all. The King of the Belgians has a summer residence at one end of the Digue, and in the centre is a spacious and resplendent *Kursaal*, where one may read the journals and enjoy the other urban distractions necessary to the Continental summer resident, at high prices. But altogether, in spite of the splendid reach of beach and sea, and the inspiriting salt breezes, if one is not installed in one of the villas aforesaid, and swinging in his hammock or eating his dinner in one of the cosey recessed piazzas which form their main feature, one leaves Ostend without regret at the end of a day's stay—especially if one has the appetite for oysters of the American in Europe, and has come hither only to find the season over, and the bivalves hopelessly *malades*.

Especially, also, if one is going to Bruges, distant a half-hour's whiz (for some unexplained reason, the trains in Belgium run faster than anywhere outside of England). There are cabs in Bruges, but they seem mere decorative details of the great square, to a hotel in which a municipal porter trundles your trunk on a back-breaking wheelbarrow, behind which you follow with unequal steps. It is one of the largest squares in the world, and as eloquent a monument of former greatness as can exist, its vast vacancy still paved with cobble-stones, which workmen are renewing here and there, as if Bruges were yet the commercial centre of Europe and the residence of twenty foreign ministers, as it was in the fourteenth century, instead of a musty, silent town of 45,000 people, a third of whom are reputed paupers. Silent is an ill chosen epithet in one way. The streets seem deserted, the shops small, few, unfrequented, and exaggeratedly retail; but for the little mirrors attached to the exterior of the windows to satisfy curiosity within as to the aspect of passers-by, the houses would seem tenantless; yet this effect is in an eccentric measure counterbalanced by the incessant clanging of the chimes in the old tower—in the Belfry of Bruges, that is to say. The contrast is exceedingly odd; the tinkling each quarter-hour, day and night, seems so irrelevant as to have the fanciful motive of a desire on the part of the municipal authorities to enliven by main strength, as it were, the dead-and-alive dulness that muffles the echo of one's tread. Dulness, however, is not part of the Flemish character, at least so far as deportment is concerned; and, quiet as the town seems as one is walking its streets or taking his coffee under an awning in the great square opposite the Belfry, if he wend his way in the cool of the evening through the narrow-gabled rows, over the bridges (the "bruges") of the stagnant canals to the park, there is life enough to be found. If the people is Flemish, it is at least not Anglo-Saxon, and it is Catholic, and understands enjoying itself gregariously after its own fashion. The fashion is characteristic. Within an enclosure which one pays to enter are a sufficient number of the aristocracy of the place, listening, with presumable delight, to alternations of Wagner and Bellini, performed with equal gusto and skill by an orchestra belonging to a musical society of the town; but, without, the Bruges youth of both sexes is illustrating its notion of fun, the laughter Homeric, the romping boisterous beyond belief. A strapping boy of fifteen seizes a personification of buxomness around the waist, and they roll over together on the gravel walk in a gale of innocent indecorum. One

comprehends the inspiration of Rubens's rollicking carnivals of nymphs and satyrs.

It is, of course, almost altogether as a museum that Bruges interests the traveller. At a side-altar of the cathedral is the lovely "Virgin and Child" of Michael Angelo, who here more than anywhere else expressed his unmistakable and characteristic sentiment in the caressing curves and soft roundnesses of a composition truly Raphaelesque. In a chapel near by are the tombs of Charles the Bold and his daughter Mary, the latter the earlier and far superior—indeed, one of the finest monuments of the Renaissance. Except at Dijon, where Charles's ancestors, Jean Sans-Peur and Philippe le Hardi, repose in splendid effigy on marble biers sculptured by the Fleming Claux Sluter, there is nothing of the kind like it in existence, north of the Alps—one has always to add that qualification where the fine arts are concerned. But the Memling exposition at the Hospital of St. John is unique. To see adequately this charming painter and really to enjoy his delicate sensibility, one must visit Bruges. The great galleries afford glimpses of his genius; there is a large and important picture by him in the Louvre, and a beautiful panel now buried in the Historical Society's rooms in New York is probably by his hand. But really to have one's fill of him, one must see the famous "Châsse of St. Ursula," the "Marriage of St. Catherine" (according to Fromentin, his masterpiece), the "Epiphany," and the three others which glow tranquilly in the old hospital chapter-room. He is represented, too, at the Académie des Beaux-Arts, though here Van Eyck outshines him, perhaps, to say nothing of the fine pair of panels by Gerard David.

Van Eyck's masterpiece is, as every one knows, at Ghent; and I confess it was to me nearly the one attraction of that city. The French found a Rubens in a neighboring chapel of the cathedral worthy of transportation to Paris; but in their place, I should have let it remain where it was. The "Adoration of the Mystic Lamb" of course accompanied it, and owes its unhappy dismemberment to the fact. The part restored to Ghent, however—*i. e.*, the central portion—is the most interesting, and the visitor to Ghent will find it wise to neglect in its favor most of the other guide-book solicitations; thus, I would, for example, willingly exchange my knowledge of Béguinage internal economy for a more distinct recollection of certain details of this picture. What strikes one most in it, as in all this early Flemish painting—the ante-Rubens Flemish art—is its intense humanity. This is, if not its salient, at all events its essential, characteristic. There is nothing like it in all Italy. From Cimabue to Tiepolo, Italian art occupies itself with the ideal, or, if one chooses, its ideal is the "something afar." There is nothing like it, either, in Holland. Pieter de Hooghe is as ideal in his way as Raphael; Steen and Ostade and Braur are generalizers in their genre, too, and it is not humanity of their sort that is here meant. But Leonardo's sketches of heads—which passed indeed for grotesques, until he affirmed that they were Milanese portraits—are not more idiosyncratic than Memling's Madonnas. In the complex compositions of the Van Eycks, of Roger Van der Weyde, of Gerard David, of Quentin Matsys, the individuality of each personage is insisted on with a force theretofore and thereafter unknown. It recalls the fiction about Turgeneff's way of writing out the entire history of a character whom he designs for only a momentary passage across his stage; Jan Van Eyck must have carried personal observation to some such completeness in the wings of "The Lamb," and Matsys in his "Entombment" (at Antwerp), where the crowds of individuals are particularized to the last degree of intimacy. And this is done not at all in the modern spirit of detail, the Dutch spirit; its inspiration is thoroughly and purely human. Every one has seen Memling's Saint Ursula somewhere: she seems like an actress—like some one person, at least, performing the part, and you feel her personality far more than the legend. I have heard it suggested, even, that the Saint Ursula and the unvarying Madonna of the same painter were Mary of Burgundy, Charles the Bold's daughter, and a possible patron of Memling. In Hubert Van Eyck's imposing figure of God the Father, which dominates "The Lamb," there is no divinity, no generalization, nothing typical. It is stiff; the expression is a trifle vacant, if you will; the accessories are Byzantine in pattern and perfunctoriness; but the character is intimately personal—intensely human, as I said. Perhaps that is why Mr. Crowe calls it Christ. It is not the same thing at all as reality; whether or no the painter had an approximate model even, seems doubtful.

Taine calls the "Adam and Eve" of the Carmine at Florence two Florentines whom Masaccio had undressed, and whose artisan or bourgeois forms, unmodelled by the nude life and gymnastic training of the Greeks, he painted with fidelity; and then he asks how it comes that these personages, nevertheless, live a superior life and strike one as noble, and concludes, very justly, that it is because, from the multitude of observable things in his models, Masaccio chose the most important and subordinated the rest to these. Now, in the "Adam and Eve" of Hubert Van Eyck (the originals are at Brussels; no one must judge them from Coxie's copies at Ghent) the effect is arrived at in exactly the contrary way. So far from leaving out or subordinating anything, it seems as if it had been Van Eyck's endeavor not only to realize the multitude of observable things in their completeness, but to extend the range of these into the domain of the imagination. It is as if his model had not been intensely enough human. Not only is nothing trivial, nothing ugly, nothing in the inferior life of his personages unworthy of reproduction, but after the eye has exhausted its unaided effort a magnifying-glass discloses still further completeness of representation. And the effect thus obtained is a powerful one. It cannot, perhaps, be contended that it is agreeable, but in art, after all, the main thing is to be moved, and one feels strongly before these figures the serious personal import of their "naked and ashamed" estate. Mr. Crowe's remark, in criticism of the ugliness of the Eve, that "the body protrudes," seems almost ludicrous. The same quality is observable in all the Bruges Van Eycks, and Memlings, and Gerard Davids, notably in the fine Jan Van Eyck in the Museum, usually called the "Saint Donatian." W. C. B.

Correspondence.

WHY THE BEST PUPILS TAKE THE CLASSICS.

To the Editor of The Nation:

Sir: In the *Nation* of September 13 a correspondent offers, as a proof of the superiority of classical studies as a means of mental training, the fact that at the exercises of the classes graduated from the Albany High School the prizes for rhetorical excellence are generally carried off by those pupils that have studied the classics, though they have less direct training in rhetorical work.

Had he shown that on entering the High School those pupils that do not take the classical studies are, on the average, the equals of those that do, the fact that the latter come out ahead might prove something as to the relative value of the training each had had. As it is, nothing of the kind is proved. The fact is, that in most high schools where Latin or Latin and Greek are taught, the most able pupils, on entering the school, take the course containing these studies. There are several causes that bring this about. In the first place, the better educated and cultivated of the community have been trained in these branches, and are naturally prejudiced in their favor, and so have their children study them too. Secondly, there is an impression abroad that no good university will admit those that have not studied Latin and Greek, and, as a consequence, parents that wish to give their boys and girls a college education (whether themselves educated or not) have them take these studies, though often of the opinion that the college course would be improved by a lessening of classical work. Still, the most potent influence in leading the brighter pupils to take classical studies is that of the head teacher in the school. In most cases he is himself a classical scholar, and neglects no opportunity to induce promising boys and girls to enter the classes pursuing these studies. I seriously doubt his right to use much influence in this way; still, it is very generally done.

Thus it happens that the classical section of our classes contains the more capable pupils, does more work throughout the course, and appears with more distinction at the close of school. Additional work in rhetorical studies, and even superior teachers, could not give the poorer section better minds or more successful powers of speech. George Hempl.

La Porte, Ind., October 1, 1883.

To the Editor of The Nation:

Sir: In the current Greek discussion a great deal of weight has been attached to the *facts* presented by "R." of Albany in your columns, and to the statement of the President of Amherst that the classical students in his college far surpass the "scientific" students in even the scientific studies. My own experience convinces me that the Albany facts are meaningless, and that the Amherst facts have been put in such a way that, instead of reflecting light on the discussion, they cast a shadow. When I was at Amherst the scientific students were either fellows with inferior preparation or else those who had been dropped from the classical department, and did not wish to be dropped from their class. The Albany facts are worthy of more consideration, and my only reason for saying that they are meaningless is that they are very similar to some facts which once mystified me. When I began to teach English literature to the Seniors in the Columbus High School, I found that the classical students were in general much superior to those who had been taking a German-English course. This weighed a good deal with me until I found that the same difference existed between the corresponding divisions of the Freshman class. It seemed that those pupils elected the classical course whose parents were ambitious to make them "scholars," and this ambition was often prompted by a remarkable grammar-school record. If, therefore, parents in Albany are at all like parents in Columbus, we should, of course, expect that more of the literary prizes would be taken by the classical students than by those who never hope to make any pretensions to advanced scholarship.

I may be wrong in supposing that the condition of affairs in Albany is similar to that in Columbus, but I am not wrong when I say that the Albany statistics will not be regarded as

convincing until they have had a thorough and scientific treatment. A good many of us believe there is truth in the saying that "there is only one thing which lies worse than figures, and that is facts."—Very respectfully,

CHAS. B. SPAHR.

NEW YORK, October 4, 1883.

RIGHTS OF MARRIED WOMEN.

TO THE EDITOR OF THE NATION:

SIR: In connection with the article on "Married Women's Rights" in the *Nation* of Sept. 27, it may not be uninteresting to quote a case, Schinckl *v.* Schinckl (12 Md. 108, 1858), arising under statutes substantially the same, no doubt, as the act recently passed in England. In the Maryland case it appears that the wife, having parted from her husband on account of alleged ill-treatment, and having returned to her father's house, sent an agent to her husband's house, in his absence, to take possession of certain furniture belonging to her before marriage; and, in an action of trespass against the agent, in which the defence of the wife's authority was set up, the Court of Appeals held (the quotation is from the decision as abbreviated in the head note) "that the object of the recent acts of Assembly of this State in reference to the property of married women was to protect the property of the wife from the debts of the husband, and during life to secure its enjoyment to the wife; they confer on her no right to separate from her husband without cause, and to remove from his custody her personal property."

This decision is at variance with the conclusions drawn from the English decision by the writer of the late article in the *Nation*, but not necessarily at variance with the decision itself; for it seems that the husband in the English case was in the habit of taking property from the wife's house whenever he visited her, and, therefore, the injunction was necessary in that particular case for the *preservation* of the wife's property; but, had not the husband evinced this kleptomaniac disposition, then, under this Maryland decision, and not inconsistently with the English decision, he would have a right not only to visit his wife's house, but to take possession of it and hold it so long as the property could be safe for, and accessible to, her in his holding. In short, the object of such statutes is purely the protection and preservation of the wife's property from the husband's liabilities and his misuse; and all rights of the husband not inconsistent with preservation of the property are unaffected by these statutes. Hence, in order to prevent the husband's possession of or access to the property of the wife, it must be proved that his possession means the property's destruction. A mere whim of the wife's is not sufficient to give her control of her property against her husband as it is to give any other owner of property (who is unmarried and without children) rights of exclusive possession against the whole world. JOHN H. MORISON.

56 ST. PAUL'S ST., BALTIMORE, MD., Oct. 4, 1883.

THE NEWSDEALER'S RATE OF INTEREST.

TO THE EDITOR OF THE NATION:

SIR: I am not a business man, but have lately had some affairs to transact which necessitated my talking with quite a number of men in an important branch of business, and I was deeply impressed with the crudity and superficiality of the ideas of most of them concerning the matters with which they were continually occupied. I was reminded of this by the argument attributed to the *Herald* in this week's *Nation* on the subject of newsdealers' profits. It is the sort of thing that makes one sometimes think it a hopeless task to spread correct economic ideas among any large body of people.

The *Herald* says that the "rate of interest" that can be made by a newsdealer is 16 per cent., or five times as great as that of the Government bondholder. The *Herald* forgets that this "interest" is made by the newsdealer in one day, or perhaps a fraction of a day; so that we ought to multiply by 365, and say that the rate of interest is some 5,800 per cent., or 1,800 times as great as that of the Government bondholder. If the writer in the *Herald* had not made this little oversight, these figures would probably have warned him of the absurdity of his comparison by showing him that he was proving too much—that cheapest of all ways of detecting a fallacy. Of course, in point of fact, the rate of interest plays an infinitesimal part in the business.

These comments would not have been worth making, were it not that the remarks to which they refer are only too typical, in their looseness and inconsequence, of much of the writing and talking upon economic subjects which is suffered to pass current. F. F.

BALTIMORE, October 6, 1883.

Notes.

G. P. PUTNAM'S SONS add as a tenth volume to their "New Plutarch Series" a 'Life of Frederick the Great,' by Col. C. D. Brackenbury, of the British army. They will also publish 'A Study of the History of Democracy,' by Jonathan Norcross, of Atlanta, Ga.; 'The True Theory of the Sun,' by Thomas Bassnet; and 'The Words of Christ,' by President Bascom of the University of Wisconsin.

J. W. Bouton's list of foreign illustrated works of which he will be the publisher for this country embraces new editions of Brillat-Savarin's 'Physiologie du Goût' and of Major's Cruikshank edition (1831) of 'Robinson Crusoe'; also, a second series of Racinet's 'Polychromatic Ornament'; 'The Art of the Old English Potter,' by L. M. Solon, with fifty etchings on copperplate; Louis Gonse's 'L'Art Japonais,' in two volumes, 4to; 'Humor, Wit, and Satire of the 17th Century,' by John Ashton; Sterne's 'Sentimental Journey,' with original drawings by Louis Leloir; and the late Samuel Palmer's English version of Virgil's 'Eclogues,' with fourteen of the translator's own designs.

An English version of Octave Uzanne's 'Sunshade, Muff, and Glove,' with its extraordinary illustrations in photogravure, is announced by J. B. Lippincott & Co., who also have nearly ready 'The Lost Histories of America,' by W. S. Blacket.

The Century Co. will make a book of the papers lately contributed to their magazine by the Rev. Washington Gladden, on "The Christian League of Connecticut." Cloth and paper editions are promised.

The Althrop Publishing House, Chicago, announce 'The Merchants' and Tourists' Guide to Mexico,' by Charles W. Zaremba, special agent of the Mexican Government. The volume will consist of 150 pages of text and seven railroad maps, and will give information concerning the Mexican tariff, the geography and history of the republic, the location of the most celebrated antiquities, etc., etc.

'Worthington's Annual,' an illustrated volume for children of all ages, is promised immediately by R. Worthington.

P. Blakiston, Son & Co., Philadelphia, will publish on October 15 a 'Manual of Psychological Medicine and Allied Nervous Diseases,' by Edward C. Mann, M.D. The volume will be illustrated.

The first volume of Macmillan's edition of Emerson's works, which is the last of the series to appear, having been delayed for the introductory essay which Mr. John Morley is to write, will be published immediately. When Parliament rose Mr. Morley left London for the purpose of finishing it at once. It is awaited with a good deal of interest in England, as no one is better qualified than Mr. Morley to deliver a verdict upon Emerson in accordance with modern radical philosophic ideas. Macmillan & Co. have in the press and will publish immediately a volume of poems by Mr. Sam Ward. A collection of Mr. Ward's poems was published in New York many years ago, and a second edition of the same by Hotten in London in 1871. In the present volume many of the previous poems are omitted and new ones added, among the latter being a number of French verses. It is called, as before, 'Lyrical Recreations,' and is dedicated to the Earl of Rosebery, "Decori Scotiæ et Humanitatis."

Funk & Wagnalls have in press 'Our Christmas in a Palace' (*i. e.*, in a palace car), by Edward Everett Hale; a translation, by the Rev. G. F. Behringer, of Brooklyn, of Rein's 'Popular Life of Martin Luther,' based on Köstlin's.

The formation of the American Ornithologists' Union has taken place under the best auspices, and with the greatest harmony and good feeling. Mr. J. A. Allen was chosen president. The Nuttall Club, of Cambridge, Mass., have turned over its *Bulletin* to the new association, which will thus, beginning with January, have an established organ. The new series, vol. i., will correspond to vol. ix. of the old series, and the magazine will come before the public as a quarterly journal of general ornithology.

The following titles are from the list of T. Fisher Unwin, London: 'Arminius Vámbéry, his Life and Adventures, written by Himself'; 'Pilgrim Sorrow,' prose poems by the Queen of Rumania, translated by Miss Helen Zimmern; 'Table Talk of Martin Luther,' a new selection, translated and edited by Professor Gibb; 'Robinson Crusoe,' a foolscap quarto edition, with twenty drawings in color by Kauffmann; and "Lives Worth Living," a series of biographical works, of which the first four volumes will be new editions of works similarly comprehensive, as, H. A. Page's 'Leaders of Men,' etc.

The new editions of the week are Prof. H. M. Baird's 'History of the Rise of the Huguenots of France' (Charles Scribner's Sons), for which our high estimate does not need to be repeated, while it must be noted that the price has undergone a reduction which puts these volumes within every one's reach; Dr. Chadbourne's 'Instinct' (G. P. Putnam's Sons), first published in 1872, and since untouched, on the express belief of the author that no new light has been thrown upon the subject by the scientists—which might be true without relieving the inadequacy of his original discussion; and William Shepard's 'Pen Pictures of Modern Authors' (Putnams). This last work has been promoted to a really luxurious estate of fine paper and broad margins and (what it had not before) portraits. Such a dignifying of a decidedly unpretentious book, and one, by the way, in which the editor's shears play a larger part than either the critical faculty or literary skill, would perhaps rather have conciliated than repelled purchasers if duly set forth upon the title-page.

Messrs. Osgood's illustrated edition of Tennyson's 'Princess' is irreproachable in its typography, and bears an effective design upon its covers. The woodcuts are numerous, and, as usual in our American work, the figure subjects are the least successful, whether as regards the drawing or the higher quality of imagination. In the landscapes the national spirit asserts itself

more confidently, and there are several passages of marked beauty. As we cannot in all cases identify the designer, we will mention no names, but to the anonymous gem on page 156 we must award the palm for investing with so much charm such simple materials. The architectural conceptions of some of these artists are as unreal as anything in the poem, which, after all, has a deep foundation in half-realized truths, and must always be read with pleasure for its music and its lofty ideals. The present edition will not fail of its admirers.

Volume iv. of the great 'Index Catalogue of the Library of the Surgeon-General's Office, U. S. A.' has been issued from the Government Printing Office. It extends from E to Fizes, and fills more than 1,000 pages. It includes 4,802 author titles, which represent 1,926 volumes and 3,885 pamphlets. The figures for subject entries are, of course, larger; there are 12,361 subject titles corresponding to books and pamphlets, and 48,977 references to articles in periodicals. A "third addition" is made to the list of abbreviations of titles of medical periodicals, showing that some new sets have been added to the library and indexed as far as could be done—that is, for the letters beyond D.

M. Jules Lévy's *Le Français* (Cambridge, Mass.), now entering on its fourth volume, tells of the second season of a Club Molière in Boston, and promises to open a department of exchange for French books by which the cost of reading may be greatly diminished. This involves gratuitous advertisement and much—we think unnecessary—trouble on the part of the obliging editor.

The significant feature of the *Magazine of American History* for October is the first instalment of a reprint of a manuscript of "Private Intelligence, beginning January 20, 1781." of Sir Henry Clinton's, now in possession of Dr Thomas Addis Emmett, of this city. This reproduction is learnedly prefaced and annotated by Mr. Edward F. De Lancey, and possesses a high degree of historical interest, beginning as it does with the revolt of the Jersey line, which promised so much for the Royalist cause and yielded so little comfort.

Apropos of the meeting of the British Association for the Advancement of Science, *Nature* for September 20 gives a "Science Worthies" portrait of Prof. Arthur Cayley, the newly-chosen head of that body, and "the greatest living master of algebra." Few heads in this valuable series have been more impressive, and few faces more attractive, than Cayley's.

A correspondent finds some encouragement for General Butler in the following passage from Renan's 'Souvenirs' (p 123): "Je m'habituais à prendre pour mes jugements pr tiques le contrepied de mes jugements théoriques, et à ne regarder comme possible ce qui contredisait mes aspirations. Plus une solution politique fut chétive, plus elle me parut avoir de chances pour réussir dans le monde des réalités."

—The October number of the *New England Historical and Genealogical Register* contains a second despatch of English probate abstracts from Mr. Henry F. Waters, whose systematic researches in London we have already made known to our readers. As before, these are annotated by the editor and his colleagues, with the result in numerous instances of establishing the connection between the English family and its American offshoot. Thus, to take a striking instance, the will of Joseph Holland, clothworker, of London, shows that he was the father of Nathaniel Holland, of Watertown, Mass.; whereas in Bond's history of that town Nathaniel was conjectured to have been son of a settler, John Holland, of Dorchester, Mass. The way to further investigation is now made plain. Other names involved in Mr. Waters's gleanings are Gorges, Parker, Gurdon, Saltonstall, Williams (offering a pretty puzzle to the antiquary, who must identify one of six contemporary Richard Williamses), Eaton, Munnings, Bell, Lyddall, Tucker, Burges, Brinley (very fully reported and edited), Sylvester, Ward, Simonds, Snape, etc. As before, Virginia and Maryland families occur among the New England, and, indeed, Mr. Waters has an eye for every reference to a kinsman "now beyond the seas." The fund in support of this public-spirited mission still needs enlargement. Another interesting feature of the present number of the *Register* is an account, by Abner C. Goodell, jr., of "Provincial Seals in Massachusetts," of which two dozen illustrations are given—the result of extraordinary patience on the part of the writer. In one instance, to obtain nine fragmentary impressions on wax, he made "a careful search through more than 2,800 different envelopes of the filed papers" of the Bristol County probate court. In the "Notes and Queries," a contributor establishes the identity of Wordsworth and Wadsworth in the poet's family line, and suggests research to determine a possible relationship to Longfellow.

—Mr. Alexander Johnston's 'Genesis of a New England State (Connecticut)' forms No. 11 of the Johns Hopkins University Studies in Historical and Political Science. It is a highly interesting *coup d'œil*, brief, perspicuous, and not more learned than literary. The growth of two separate commonwealths, of which Hartford and New Haven were the respective centres and seats of authority, and the ultimate reluctant absorption of the latter by the former, is graphically described. The Connecticut colony fostered a free-town system, while the Quinnipiack (or New Haven), on the other hand, persistently sought "to keep the towns in pupilage, and the political power in the hands of church members." The latter system went to the wall in 1664, but had a posthumous trial, it is well to remember, in the settlement by come-outers from Branford and Long Island of Newark, N. J., where theocratic government according "to the laws of God as they were delivered to Moses" finally gave up the ghost on this continent. New Haven, however, one cannot but reflect, had its revenge in being afterward given control of the higher education of the State. In the shaping of Connecticut character and legislation this may well be thought more than an equivalent for the lost town leading-strings. At least, considering the close clerical direction of Yale College for a century and three-quarters, it is a curious subject for speculation what would have been the development of the institution itself had it been removed from Saybrook to Hartford, and what its effect upon the institutions of the State.

—The first edition of Professor Perry's textbook of political economy was published eighteen years ago, and its popularity is shown by the appearance this year of the eighteenth edition (Charles Scribner's Sons). But, as the author says, it is still the same book. The changes and additions are numerous, but they affect form rather than substance, and probably no doctrine of importance ever held by Professor Perry has been abandoned by him. An experience of thirty years in teaching has brought out from his pupils, as he thinks, every possible objection to the leading points in his book, and as it is now printed from fresh plates, it may be regarded as containing his ripest thought. The late Professor Taylor, of New Haven, once acknowledged to a student that he believed that in his system every theological question found a satisfactory answer. The hearty recommendation that our author gives to his own definitions indicates a like complacency. We must confess that the armies of the Philistines are just now too strong and too aggressive to allow us to share this feeling. Moreover, we cannot regard Professor Perry's treatment of the theories of Malthus and Ricardo as at all adequate. According to him, the rate of the increase of population and the ratio of this increase to the increase of food, however interesting as physiological questions, have clearly nothing to do with political economy. If that science is to be simplified by excluding from its scope all difficult and disagreeable subjects, it may be possible to reduce it to a theoretical perfection; but such a science would be too barren to be cultivated. We incline to think, however, that these defects are really due to the author's kindness of heart, and perhaps also to the influence of his surroundings. The "law of love" has prevailed so long at Williams College that it may well be that social problems seem there of a less sombre hue than elsewhere. Certainly the "dismal" aspect of political economy is not to be discovered in this book, which beams with a cheerful optimism. The most valuable additions in this edition are to be found in the historical chapters, which contain in a condensed form much information patiently extracted from obscure and widely-scattered sources. The chief merit of the book will continue to lie in the earnestness and thoroughness with which the errors of the protectionists are exposed. The collection of facts and statistics relating to our tariffs is of great value, and is brought down to a very recent date.

—Professor Lankester's address before the British Association, on September 20, contains a great deal of interesting information regarding the present state of scientific research at German, French, and English universities. It advocates the claim of biological science in England to a far greater measure of support than it receives at present from the public funds. The condition of biological research is far below that of France and Germany, and even Holland, Belgium, Italy, and Russia, and is discreditable to England in proportion as she is richer than other states. "We know," he continues, "that knowledge is languishing and able men are drawn off from scientific research into other careers, that important discoveries are approached and their final grasp relinquished, that great men depart and leave no disciples or successors, simply for want of that which is largely given in other countries, of that which is most abundant in this country, and is so lavishly expended on armies and navies, on the development of commercial resources, on a hundred injurious or meaningless charities—viz., money." He lays down the general proposition that scientific discovery has only been made by those whose time could be devoted to it (1) in virtue of their possessing inherited fortunes, or (2) in virtue of their possessing a stipend or endowment especially assigned to them for that purpose. It is to German sources that the zoölogist, the botanist, the physiologist, and the anthropologist look for new information. It is in German laboratories that discoveries, each small in itself but leading up to great conclusions, are daily made. "To a very large extent the business of those who are occupied with teaching or applying biological science in this country consists in making known what has been done in German laboratories. Our English students flock to Germany to learn the methods of scientific research; and to such a state of weakness is English science reduced for want of proper nurture and support that, even on some of the rare occasions when a capable investigator of biological problems has

been required for the public service, it has been necessary to obtain the assistance of a foreigner trained in the laboratories of Germany."

—Germany, he continues, with a population of 45,000,000, has twenty-one universities, and about eighty more institutes at which biological discoveries are prosecuted under the most favorable conditions. England, with 25,000,000 inhabitants, has only four universities which possess endowments and professoriates—Oxford, Cambridge, Durham, and the Victoria (Owens College), at all of which, as well as at the London colleges, there is an extraordinarily small amount of provision for biological research. In proportion to its population England has only one-fourth of Germany's provision for the advancement of biological science—thirty-eight instructorships as against 300 in Germany; and while Germany spends $4,000,000 a year on her universities, the £27,000 spent on the Nottingham College of Science was in England regarded as something extraordinary. Professor Lankester demands, in order that England shall be approximately on a level with Germany, forty new biological institutes at an annual cost of £60,000. He refers to the outrageous conduct of Parliament in deliberately appropriating to other uses the property left by Sir Thomas Gresham for scientific research 250 years ago, and which is now estimated to be worth £3,000,000 sterling. Schoolmasterships are too often confounded with professorships. The best teachers, it is true, are those who are engaged in original research and have, therefore, thoroughly grasped their subject; but time and money are necessary if the teacher is to add to the stock of knowledge:

"Those Englishmen who take an interest in the progress of science are apt to suppose that, in some way which they have never clearly understood, the pursuit of scientific truth is not only its own reward, but also a sufficient source of food, drink, and clothing. While they are interested and amused by the remarkable discoveries of scientific men, they are astonished whenever a proposal is mentioned to assign salaries to a few such persons, sufficient to enable them to live decently while devoting their time and strength to investigation. The public are becoming more and more anxious to have the opinion or report of scientific men upon matters of commercial importance, or in relation to the public health; and yet in ninety-nine cases out of a hundred they expect to have that opinion for the asking, although accustomed to pay other professional men handsomely for similar service. Such mistaken views ought to be dispelled."

—The constant tearing up of our pavements and obstructing of our streets in pipe-laying and pipe-mending was bad enough while there were only sewers and gas-pipes and water-pipes under the roadway; but now that steam heating and power, and electric lighting and power, and telegraphic communication are all requiring underground transmission, the inconvenience is unendurable. The Parisians manage better. Tunnels under the principal streets carry all the drains, pipes, and wires — these veins, nerves, and muscles of the body municipal. Everything can thus be got at for inspection and repair without expense and without interfering with the travel above. The model city of the future will undoubtedly have two roadways, and perhaps a third for rapid transit. But till lately Paris was the only city that had perceived that to build a tunnel once for all is cheaper than to be continually digging and filling and paving and redigging and refilling and repaving a ditch. London has now made a beginning in the same direction. Down the middle of Southwark Street is a subway of semicircular shape and twelve feet diameter, the crown coming just below the pavement. Side passages, three feet wide, are made from the subway on each side for each pair of houses. Glazed stoneware pipes laid at a sufficient inclination bring the house drainage into an egg-shaped sewer built immediately under the subway. Gas pipes and water pipes are, and electric wires can be, carried through the subway itself. Light is obtained at intervals by circular openings in the crown of the roadway. The Paris subways are, we believe, lighted by gas. The system once introduced is sure to spread, for though the initial expense is great, there must be economy in the long run; and the lighting, heating, and water companies can be made to bear their share of the cost.

—M. Victor Jannet relates in the *Vie Parisienne* how the young thieves of Paris train themselves for their profession. It appears that you may watch the process in certain public gardens of Paris, just as you may see our future base-ball players hardening their hands and sharpening their eyes and "coördinating" their muscles on our town commons. In the training-school which M. Jannet happened upon one afternoon three gamins were sitting on a bench acting as jury; two of their companions practised before them. When the trick had been done to the satisfaction of the judges, one of the performers gave up his place to one of the jury, and so on till all had taken every part. One of the boys (they were from fifteen to eighteen years old) sauntered along, his hands in his pockets, like a well-to-do citizen taking his stroll after dinner; the other "shadowed" him, stole gradually nearer, and then passing him tripped him up. At the first trial which our narrator saw, the pseudo-thief failed to throw his victim down; the latter was staggered, but managed to keep his feet. Chorus of disapprobation from the jury; a fresh trial ordered. The next attempt was more successful. The *bourgeois* was thrown, and in an instant the thief was on him, locking his legs with his own, and gagging him with his left hand while with his right he expeditiously stripped him of porte-monnaie, ring, and watch. Chorus of approbation; change of actors. When all had played both parts in this little comedy of action, another trick was tried. At last, looking around, M. Jannet saw, to his stupefaction, a policeman gazing at the show through the railings with smiling interest, but as if it was absolutely none of his business. He questioned him. "Yes," said the officer, "they are practising what they will do this evening; they come here every day to practise." "Why don't you stop it?" "What can I do? If I interfere, they will say that it is only a boys' game. There is no law against it. Besides, this garden is in the charge of another man, and I am strictly forbidden to set foot in it unless he calls me to assist him." It is a commonplace of the moralists that if rogues would work half as hard to succeed honestly as they do to cheat and steal, they would be rich men. The scene just described may give some color to the assertion; but the labor we delight in is no labor. No one will see any sudden conversions of rogues by the preaching of such a doctrine. There have always been men who preferred poverty in their favorite calling to wealth in any other. The rascals know their own tastes best. The freedom, the irregular occupation, the still more irregular gains, the sense of superior power, the agreeable feeling of danger—all appeal to the instincts of the savage and the gambler.

TAYLOR'S ALPHABET.—I.

The Alphabet: an Account of the Origin and Development of Letters. By Isaac Taylor, M.A., LL.D. Vol. I. Semitic Alphabets; Vol. II. Aryan Alphabets. London: Kegan Paul, Trench & Co.; New York: Scribner & Welford. 1883. 2 vols. 8vo.

ALPHABETIC writing is an art easy to acquire, when once discovered, but its invention "has proved to be the most arduous enterprise in which the human intellect has ever been engaged, and its achievement has tasked the genius of the three most gifted races of the ancient world." At different epochs and by various races there have been devised methods by which events might be recorded and messages transmitted. All have started with rude pictures of objects, which, more or less conventionalized, have gradually been employed as representatives of words, and which afterward have become the symbols of sounds more or less elementary: that is to say, writing began with *ideograms*, or pictures intended to represent either things or thoughts, which afterward developed into *phonograms*, or the graphic symbols of sounds. The latter are of three kinds—signs standing for whole words, for syllables, and for the sounds into which they can be resolved. Our author's task, then, is to prove that the letters of the alphabet are merely phonograms, which through the lapse of time have reached the extremest stage of simplicity, and which may all be resolved into the conventionalized picture of some object. As an illustration, he gives at length the history of the letter M, which is traced down from the conventionalized picture of an owl—in the ancient language of Egypt, *mulak*. This was primarily used as "an ideogram to denote the bird itself, and secondly as a phonogram standing for the name of the bird. Then it gradually became a syllabic sign used to express the sound *mu*, the first syllable of the name, and ultimately it came to be employed simply to denote *m*, the initial sound of that syllable." The various changes through which it has passed in its transformations require the assistance of plates to make them plain to the eye, and to show how they all present certain features which may be recognized as the conventionalized picture of an owl. Thus, in the letter M, the two peaks are the lineal descendants of the two ears of the owl, and they still retain between them a not inapt representation of the beak. In like manner, A can be shown to be originally the picture of an eagle, D of the hand, F of the horned asp, R of the mouth, and so on.

Before entering upon the task of investigating systematically the origin and connection of the many hundred alphabetic signs in use in different parts of the world, the author gives a rapid sketch of the various systems of non-alphabetic writing, with the special object of investigating the processes by which primitive ideograms have passed through the successive stages of phonograms, and of syllabic signs, until they finally developed into letters. Passing hurriedly over the less elaborate methods that have been devised by various savage races, of the five great systems of picture-writing which have been independently invented—the Egyptian, the Cuneiform, the Chinese, the Mexican, and the Hittite—he proceeds to treat of the three former with considerable detail. But of the Mexican system very little is told except that "at the time of the arrival of the Spaniards it was just reaching the stage of the phonographic expression of the names of persons and of places." The first step had been taken, and under the tuition of the missionaries the Mexican ideograms were so developed as to become capable of transcribing the Pater-Noster. But the old error is repeated that the Mayas of Central America had by themselves advanced further on the path which leads to alphabetic writing. Based upon the misleading guidance of Bishop Landa's manuscript, and its pretended "key," the astounding statement is hazarded that "the Mayas employed twenty-seven characters which must be admitted to be alphabetic"; and that "the high state of

civilization attained by this people is thus attested not only by the ruins of their magnificent buildings, but by the invention of a system of writing actually superior in simplicity and convenience to that employed at the present day by the Chinese, or even by the great Assyrian nation at the epoch of its highest power and glory." But when we come to read further on that "the systems of picture-writing which were invented and developed by the tribes of Central America are very obscure, and but little is really known about their history," our confidence in the author's soundness of judgment and capacity of drawing legitimate conclusions receives a severe wrench. It is evident that he is by no means well informed as to the latest conclusions of the special investigators of American antiquities.

In treating of the obscure subject of the so-called Hittite characters, an excellent résumé is given of the little that has thus far been discovered in regard to one of the most powerful peoples of the primeval world, whose empire extended from the Euphrates to the Ægean, and from Syria to the Euxine, and who, like the Egyptians and the Babylonians, possessed a culture, an art, and a script peculiar to themselves and plainly of indigenous origin. Scholars are only just beginning to realize the vast extent of their dominion, and their important place in primitive history. It is now admitted that the earliest art and the mythology of Asia Minor were to a great extent obtained from the Hittites, while the independent system of picture-writing which they possessed offers an obvious source from which to explain the origin of the Cypriote script. This has long proved a puzzle to the interpreters, and has only recently yielded to the efforts of a few scholars of different nationalities, all of whose names we find mentioned by our author with deserved respect, with a single exception. He makes no reference to the successful labors of an American scholar, Prof. Isaac H. Hall, of Philadelphia, who first published a translation into English of the celebrated bronze tablet brought by the Duc de Luynes from Dali (the ancient Idalium), and who first gave to the world in the *Journal* of the American Oriental Society the Cypriote inscriptions contained in the Cesnola collection at New York. Even this collection is passed over without mention; and the name of Cesnola does not occur, although the inscription upon the gold armlet of King Ithyandros, of Paphos, which was discovered by Cesnola at Kourion, and which is now in the Metropolitan Museum of Fine Arts in New York, is given at length both in the mysterious Cypriote characters and in the equivalent Greek letters into which they have been resolved.

We must pass over our author's interesting account of the Chinese system of picture writing, with its 40,000 ideographic signs, capable, it is true, of being expressed by 1,358 conventional symbols, but only on condition that "at the age of twenty-five a diligent Chinese student has barely acquired the same facility in reading and writing which is usually attained by a child in an English village school at the age of ten." We can, too, merely allude to the great simplification this system has undergone in the Japanese syllabaries, in which only 231 different types are required to print a book; nor have we space to describe the different cuneiform systems of writing, the three chief stages of which are best exhibited in the great tri-lingual inscription of Behistun, containing three versions of a decree of Darius, in one of which the language is Aryan, in another Turanian, and in the third Semitic. Let us come at once to the account of the hieroglyphic system of Egypt, and of De Rougé's great discovery of the derivation from it of the alphabet.

It is difficult to realize fully the immense antiquity of the Egyptian hieroglyphic writing. The oldest example extant of it, and consequently the earliest existing inscription in the world, is a tablet erected by Sent, a king of the second dynasty, to the memory of his grandson. According to the chronological system of Brugsch, who is not at all inclined to extravagance of statement, this king must have reigned about 4000 years B. C. This venerable historical record is now preserved in the Ashmolean Museum at Oxford, and it affords conclusive proof that even at that distant date the hieroglyphic writing was already an extremely ancient system. From the time of King Sent down to the reign of Trajan, when it went out of use, many of the picture ideograms with which it commenced continued to be employed to the very last. These primitive ideographic signs gave birth to verbal phonograms, which came to be used as syllabic signs. As an example of the manner in which this development took place, the author gives the instance of the picture of a lute, which was used symbolically to denote 'excellence.' Then it came to stand as a phonogram for the word *nefer*, 'good.' But in the Egyptian speech this word also signified 'as far as,' so that the same character might represent literally a lute, or symbolically it might stand either for 'excellence' or the preposition *nefer*, meaning 'as far as,' and lastly as a syllabic sign to denote *ne*, the first syllable of the word *nefer*. It would happen almost necessarily that many symbols would be polyphonic, and hence ambiguities would arise, which made requisite the simultaneous employment of explanatory determinatives, either special, whose use was confined to one word or idea, or generic, referring to whole classes of words. These determinatives were placed after the words phonetically expressed: for example, a man with his hand pointing to his mouth was added to words relating to eating, speaking, or thinking; two legs to words connected with locomotion.

Such a system of phonograms, developed out of primitive ideograms, and interpreted by means of determinative signs, is common to other primitive methods of writing, such as the Cuneiform and the Chinese. But in the Egyptian system we find associated a certain number of characters which must be pronounced to be alphabetic in their nature. "The immensely early date at which such symbols are found is a fact of the highest importance, as it constitutes the starting-point in the history of the alphabet, and establishes the literal truth of the assertion that the letters of the alphabet are older than the Pyramids—older, in fact, than any other existing monument of civilization." Certain peculiarities attaching to the hieroglyphic letters clearly indicate that the Egyptian alphabet was obtained by gradual evolution out of a prior syllabary—a process which must have taken many generations to effect. Symbols for vocal sounds are found in the syllabaries of other nations, but the more difficult conception of a *consonant*, a sound that can be produced only in conjunction with some other sound, was attained by the Egyptians alone. In this they were aided by the nature of their language, in which each consonant has its "complementary vowel," which in reading must often be treated as a mere expletive, and in writing was constantly omitted, only initial and final vowels, and medial vowels when emphatic, being necessarily written down. The consonants also show a preference for certain vowels and an aversion to others; and the vowels themselves, which appear to have been of a more indeterminate character than in most other languages, were almost regarded as inherent in the preceding consonant.

The final stage in the formation of the Egyptian alphabet was the gradual selection out of the 400 phonograms that might be so employed of certain symbols to denote the initial sounds of words. Gradually the arbitrary use of these was restricted to two or three of the more easily-written hieroglyphics to denote any particular sound. The number of characters thus used at various times may be reckoned at forty-five, which was ultimately practically reduced to twenty-five, and agrees with the tradition handed down by Plutarch that the Egyptians possessed an alphabet of twenty-five letters. But although from the times of the earliest known monuments they were actually in possession of a sufficient number of true letters to enable them to write alphabetically, they were unwilling to trust themselves to its simplicity, but thought it necessary to interpret the meaning of their alphabetical symbols by needless additions of ideographic and syllabic signs. The great achievement of boldly discarding all this superfluous lumber and of revealing in its grand simplicity the nearly perfect alphabet of which, without knowing it, they had been in virtual possession for countless ages, was beyond the power of Egyptian conservatism to effect. It was left to another people to take up the problem and to make the grand discovery. The triumph of this great conception belongs to the Semites.

The tradition of the ancient world, which assigned to the Phœnicians the glory of the invention of letters, declared that it was from Egypt that they originally derived the knowledge of the art of writing, which they afterward carried into Greece. When, however, this ancient belief is brought to the test of modern scientific investigation, it is found that there is no such easy and certain transition from the Phœnician to the Egyptian writing as there is from the alphabet of Greece to the primitive alphabet of the Semitic nations. The two alphabets agree neither as to the number, the order, the names, nor the forms of the respective letters. "Till a very recent period these difficulties have led many scholars of repute to the conclusion that classical tradition was at fault in asserting that the Phœnician letters were originally obtained from Egypt, . . . and the origin of the alphabet has been deemed by the highest authorities an unsolved, if not an insoluble, problem. . . . But as in so many similar cases, the result of the latest investigations has been to rehabilitate the discredited tradition of antiquity."

Of this great discovery the entire credit is due to the genius of a French Egyptologist, Emmanuel de Rougé. The first account of his investigations was given in a paper read before the Académie des Inscriptions in the year 1859, but it was only as recently as 1874 that it was published in full from the rough draft of the original, and carefully edited by his son. The secret of his brilliant success lay in his divining that the immediate prototypes of the Semitic letters must be sought, not, as before, among the hieroglyphic pictures of the Egyptian monuments, but among some one of the different cursive characters which had been developed out of them, and which were employed for literary and secular purposes. Rejecting the later Demotic types, M. de Rougé turned to the oldest form of Hieratic writing which had arisen during the early empire, and was in use at the time of the Semitic conquest of Lower Egypt, which is known as the invasion of the Hyksos. He began by determining the oldest-known form of the Semitic letters, employing such few materials as were then available, especially the inscription on the sarcophagus of Eshmunazar, King of Sidon—for the famous Moabite stone, which strikingly confirms the results he obtained, was not discovered till ten years later. The materials

for reconstructing the early Hieratic alphabet were still more meagre, and were practically confined to the celebrated papyrus, now in the Bibliothèque Nationale at Paris, which was brought from Thebes by M. Prisse d'Avennes, and published by him in 1847. A statement at the end of this papyrus shows that it is a copy of an original work composed by Prince Ptah-Hotep in the time of the third dynasty; but as the MS. was discovered in a tomb of the eleventh dynasty, the copy itself must be anterior to the Hyksos invasion, and therefore older by centuries than the time of Moses—older even than the date usually assigned to Abraham. This priceless Papyrus Prisse, "le plus ancien livre du monde," as it is styled by Chabas in his interesting account of it published in the *Revue Archéologique* for 1858, is "one of the strangest waifs that have floated down to us from the very childhood of the world." It is a treatise upon ethics, in which an ancient sage moralizes upon the deterioration of his age, and laments the good old times that have passed away. Here we have disclosed to us a picture of social life some 6,000 years ago, and even then the ethical teacher regards himself not as treating of novelties, but as preserving and transmitting to posterity the wisdom of his ancestors. We find that not only are the palette and inkhorn used as signs, but reference is made to older books as authorities for several statements. If books were written in Egypt before the third dynasty, how far "into the dark backward and abysm of time" must the beginnings of her civilization be thrust? From this invaluable relic of the past M. de Rougé obtained the characters so peculiar, so unmistakably distinct from every other form of Egyptian writing, which he brings forward as the prototypes of the letters of the Semitic alphabet. With great minuteness he sets forth the considerations which have led to the adoption of each of his identifications.

Mr. Taylor gives a most lucid and satisfactory summary of these arguments, but it would be impossible to give a comprehensible account of them without the help of engravings. After carefully weighing the objections to the hypothesis, he finds in them no difficulty which can be considered fatal to the argument, no objection to which a reasonable answer may not be made; but, on the contrary, he discovers an entire lack of evidence in favor of any of the other possible alternative sources of the Semitic alphabet that have been suggested. This strong case is then still further strengthened by an elaborate study of the "chronological conditions" of the problem, and of the "geographical probabilities" that bear upon it, admirable both for learning and for logic. Briefly, it may be summed up as follows: The Semitic occupation of Egypt lasted for several centuries, and synchronous with it was the sojourn of Israel in Egypt. Before the Hebrews went down into Egypt the art of writing was unknown to them; when they came out of Egypt they possessed it. The inference is clear that they must have acquired it from the kindred races who occupied the Delta. The internal evidence points in the same direction. The forms of the Semitic letters can be discovered in those of the Hieratic writing in use at the time of the Semitic conquest, and the names borne by the Semitic letters give us a certain amount of information as to the mode of life and the social condition of those who gave them. These names are, without exception, consistent with the suggested origin of the alphabet in the Delta among a people in a condition intermediate between the purely pastoral and the purely agricultural stages of civilization; while the city life of a great industrial and commercial nation and the desert life of mere nomad shepherds seem equally excluded. If we assume that the alphabet was invented in Lower Egypt, it is almost equally easy to suppose that the Hyksos took it with them on their expulsion, or that it was conveyed to Sidon by means of the Phœnician trading settlements in the Delta. Both of these hypotheses have found learned adherents, but the latter, which has been ably advocated by Lenormant and Sayce, seems to be the more probable. However this may be, there can be no doubt that the character of the Phœnicians—a practical, commercial people, the merchants and carriers of the ancient world, who employed the art of writing for business purposes—gave them special facilities for aiding in the subsequent diffusion of the alphabet.

RUSSIA AND THE RUSSIANS.—III.*

L'Empire des Tsars et les Russes. Par Anatole Leroy-Beaulieu. Tome ii. Les institutions. Paris: Librairie Hachette et Cie.; New York: F. W. Christern.

Czar Alexander I., imitating Napoleon, established a Ministry of Police. Nicholas had two police institutions, of which one, endowed with extraordinary powers, was to watch over the safety of the state and the doings of the public functionaries. This was the Third Section of the Private Chancellary of the Emperor. It formed a special ministry, independent of all the others, and in many respects superior to them. Created in 1826, it existed for more than half a century. It was the old state inquisition of Peter the Great, Catharine II., and Paul, with its scope enlarged. Destined to bridle administrative corruption and licence, where liberty and publicity formed no check, this uncontrolled instrument of control could not fail to become, in the hands of grandees and favorites animated by hatred, ambition, or fear, an engine of arbitrary sway, of persecution, of extermination. Its destructiveness was the more terrible because of the noiselessness with which it worked. The martyrology of the State Chancellary surpasses that of the Spanish Inquisition. Its victims of every rank, age, and sex, cannot be counted, because, instead of exhibiting them in *autos-da-fé*, it shrouded them in mystery, and buried them in the silent snows of Siberia. Despatching them without being stained by their blood, without hearing their cries, it struck the more pitilessly.

The Third Section, under Nicholas and Alexander II., was a special and privileged power, outside and above the law. Its chief, called also chief of gendarmes, was by right a member of the Cabinet, and, more than all other ministers, the confidential adviser of the Emperor. To his veto, based on secret information, every appointment to office was subject. His influence was heavily felt everywhere; he could imprison, banish, put out of sight whomsoever he liked. This power was under a cloud during the reform years of Alexander II.; its splendor seemed to be gone for ever; but Karakozoff's attempt on the life of the Czar in 1866 completely revived it. The direction of the Third Section was then given to Count Peter Shuvaloff. It was afterward successively in the hands of two generals, Mezentzeff and Drenteln. But the sceptre of the police showed itself feeble and incompetent, in spite of its omnipotence. Conspiracy was rife everywhere; murderous attempts were made in broad daylight; the Third Section, with all its terrorism, was powerless to prevent the deeds or punish the perpetrators. About 1878 a regular duel had begun between the police and the avengers of its atrocities. General Mezentzeff was stabbed to death, by an unknown hand, in the streets of St. Petersburg; General Drenteln was shot at in his carriage by a rider on horseback, who then escaped. Solovieff's pistol-shots, aimed at Alexander himself, in 1879, made the police for a time supreme in the land, but new and more extraordinary regicidal attempts clearly proved its inefficiency. Drenteln resigned, and finally, in August, 1880, the Third Section was abolished by ukase, and the management of the state police united with the Ministry of the Interior. This abolition, however, was no surrender of arms, no sacrifice of autocratic sway, no concession. It was a concentration of powers, a uniting of both branches of the police. The two attempts to blow up the Emperor, made near Moscow and in the Winter Palace at St. Petersburg, had led to the vesting of Loris-Melikoff with dictatorial powers, and this dictatorship could tolerate no rival discretionary power at its side. The change made the Minister of the Interior also chief of gendarmes. Greater unity, facility, and intensity of action were expected from this simplification of the administrative machinery. The former two branches had not only acted in disaccord, but often hampered, counteracted, suspected, and from suspicion persecuted each other.

The change did not save Alexander II., nor did it ameliorate the condition of his subjects. The state police remained as powerful as ever, and it has since made a more galling use of its unchecked sway. Under Alexander III. it is as completely independent of law and public justice as it was under his predecessors. In fact, the abolition of these prerogatives of the administration would be a revolution, an abdication of autocracy before the instituted courts. Autocracy must have the power of discarding the laws, even if it do not use it. The privileges accorded to the Minister of the Interior have been codified under Alexander III. If he decrees the "state of extraordinary protection" over a section of the Empire, its governors at once become invested with the rights of commanders in the land of an enemy. They can fine and imprison, stop publications, close schools, sequester property on mere suspicion of evil intentions, or on account of mere negligence deemed prejudicial to the public order. The use of one single weapon—the most barbarous of all, it is true—has been limited: the deportation of suspects, as an administrative measure, can, in accordance with the new regulations, be decreed only by a special commission, and only for a term not exceeding five years. Besides, all these extra-legal uses of power are now represented to be transitory, called for by extraordinary emergencies, while the omnipotence of the Third Section was normal, and, so to say, an organic part of the law of the Empire. Though the difference seems to be more theoretical than practical, it is not without significance. The change in the practice must come first; the change in the institutions will follow. If the régime remains unaltered, the provisional and exceptional will become the rule, and the rule continue to be the exception.

The Third Section was to act the part of an invisible guardian angel watching over the oppressed; it was to direct the vengeance of the Sovereign upon dishonest officials or heartless masters of serfs. Its activity in this rôle, however, failed to win the favor of society. Its uncontrolled power was but too often exerted in the service of evil. Like the French *lettres de cachet*, which were also intended to protect the honor of families and the safety of the state, the intervention of the Russian gendarmerie was often obtained, through intrigue or for money, for the purposes of revenge, seduction, spoliation, or timely intimidation. But the worst side of the supremacy of the police was its deleterious influence upon Russian society and character.

* See Nos. 882 and 883 of the *Nation*.

It fostered a spirit of distrust, and consequently of frivolity. The fear of compromising one's self caused the shunning of serious studies, conversations, and ideas. Hence the emptiness of society, mental inertia, moral and political apathy. During the better years of the reign of Alexander II. the public mind felt more at ease, and became more serious. The police terrorism evoked by the attempts of 1878 and the following years has fully revived the old general distrust. Suspicion casts its gloom upon social and family life. There is no free talk even among friends and relatives. Never were serious topics so much avoided as now. Conversation, to be safe, makes itself systematically inept and frivolous. The moral atmosphere in Russia is oppressive. Even when abroad, the subjects of the Czar betray this feeling of oppression; they seem to have lost the habit of breathing freely. The more interesting the political situation, the crisis, the less they can be persuaded to speak about Russian affairs. But this reticence has its eloquence. Still more reticent are the Russians in their correspondence. Nowhere is the post office so sadly and so justly suspected. The opening of letters presumed to contain evidences of disloyalty or information important to the Government is an every-day practice. The highest functionaries often send their correspondence through private conveyances, from fear of divulging secrets to an officious postmaster.

Secrecy and dissimulation are the natural resources of the victims of this vexatious system of pedantic tutelage and espionage. In some it has engendered indifference to public affairs and pusillanimity, in others indignation and a spirit of revolt. The hatreds and habits of concealment to which it has given birth are in great part responsible for the Nihilistic propaganda. It is hard to realize the exasperation to which even a generous nature can be driven by such constant irritations. "It is an easy matter for you," said a young Russian to our author, "to condemn the violence of our revolutionists, to counsel patience and moderation; but if you were, like us, exposed year after year to this régime of terrorism and denunciation; if you felt all the time the Damocles sword of deportation above your head—all your blood would boil, and, perhaps, you too would deem everything allowable against those who allow themselves everything." It is the tyranny of the police, with its cruel and petty provocations, which explains the fury of Russian conspirators. The occult power placed above the law could not but become outlawed by its victims; its own ways of proceeding were turned against it, with superadded keenness. Czar Nicholas's system of tutelary guardianship has reared Nihilism; it has fomented the spirit of rebellion—which it was to stifle—fostered habits of conspiracy, created clandestine societies, nurtured radicalism, introduced regicide. How long will this murderous grapple of the two secret powers last? Each of the two seems to call for the other, to justify the other. Russia, in this respect, appears to be moving in a vicious circle. Neither the Government, which is faced by resolute and unscrupulous foes, nor the revolutionists, who are exposed to all the rigors of tyranny, are inclined to disarm first. Each side calls upon the other to stop its barbarous proceedings, each accuses the other of having given the contest a ferocious complexion, and thus both continue it without mercy.

In former times Russia, like the rest of Europe, used the rack as a means of speedily obtaining confession or information. Under the father of Peter the Great the art of torturing culprits was carried to perfection. Catharine II. limited the use of torture, Alexander I. legally abolished it; but, wiped out of the law, it lingered in the land, especially in parts remote from the central authorities, where it was often disguised under the form of corporal punishment. Recently, under Alexander III. as well as under Alexander II., the tools of the Government have often been accused of using excruciating means, such as hunger, thirst, or even the rack, for extorting revelations from political prisoners. Ryssakoff, one of the assassins of Alexander II., is asserted to have shown on the scaffold his dislocated arms to the people, and his accomplice, Mikhailoff, to have exclaimed: "They have tortured us!" It is not easy to form a decided opinion concerning the truth of these accusations. They are so readily believed that, during the trial of Sukhanoff, Trigoni, and others, early in 1882, the defender of one of the accused deemed it his duty to declare that his client had not been tortured. But the current allegation is, that the torturing takes place between the condemnation and the execution. If such horrid practices do take place, they may be assumed to be exceptions. Most of the Russian conspirators, however, are convinced of the contrary, which is attested by their generally securing means of self-destruction in order to escape torture and involuntary denunciation. Even as these lines were being written, a telegram from St. Petersburg reported the suicide of a number of officers and men detected as revolutionists.

PERRY'S REMINISCENCES.

Reminiscences of Public Men. By ex-Governor B. F. Perry. Prefaced by a Life of the Author, by Hext M. Perry, M.D. Philadelphia: John D. Avil & Co. 1883.

We have read this book with an interest disproportioned to its literary merits, which are but slight. It consists of a number of sketches contributed in past years to various newspapers and periodicals (presumably Southern), and the writing of which, at least for the most part, we may suppose to have been the occupation of the unsettled and doleful period of reconstruction. They have been reproduced without editing or revision to date, and are all the more valuable on this account; for if they speak of Seward and Reverdy Johnson, for instance, as still living, that is a small offset to the contemporary record of bitter feelings now almost extinct, and of dismal forebodings of Southern ruin from emancipation now proved to be groundless. What is more, and chiefest, they afford an unconscious delineation of Southern character and of Southern standards of character, culture, and ability such as is seldom to be met with. For this reason, and because of the biographical data which might in vain be sought elsewhere, we approve the advice that led to the making of the present collection, and we hope the success of the venture will encourage the author to proceed with a second volume made up in a similar fashion.

Mr. Perry may be a well-forgotten, but he is not an unknown, personage—we mean, of course, at the North. He was the first Provisional Governor that his native State of South Carolina had after the war, being an appointee of President Johnson in July, 1865. So little was he expecting this honor—though no one was more worthy of it—that, as some of our readers will remember, he made, just before his commission reached him, a public speech to his unfortunate fellow-citizens, half "I told you so," and half a lamentation over the failure of the rebellion, and an exhortation never to forget the outrages of the Northern conquest. This book is to some extent an echo of that speech. Mr. Perry was a prominent Unionist when it cost something not to go with the current for nullification or secession, in 1832 and 1851, and again (up to the very last moment) in 1860. The Massachusetts blood derived from his father, if it did not make him more attached to the Union than to his State or to the "peculiar institution," at least kept him sane enough to discern the folly of secession, and gave him a moral courage which extorted the respect of those who sometimes threatened his life because of his political opposition. He alone, in the State Senate, voted against the expulsion of the Massachusetts legate, Samuel Hoar; he alone of the South Carolina delegation refused to withdraw from the National Democratic Convention at Charleston in 1860. Pity it was that when, as he says, he saw the State committed to going to the devil, he abandoned the proud position of a minority of one on the right side, and joined in the race to perdition.

The men with whom these reminiscences deal, nearly all, at some time or other, engaged the attention of the whole country. Presidents J. Q. Adams, and Jackson and Johnson, and the would-be Presidents Calhoun, and Clay, and Webster, and Seward, figure along with a host of members of Congress, governors, and judges, mostly from South Carolina, and including such names as Wm. C. Preston, Robert Y. Hayne, Geo. McDuffie, Daniel E. Huger, James H. Hammond, R. W. Barnwell, R. Barnwell Rhett (*né* Smith), Francis W. Pickens, James L. Orr, Langdon Cheves, Waddy Thompson, J. R. Poinsett, Hugh S. Legaré, James L. Petigru, Richard Yeadon, W. L. Yancey, Thomas S. Grimké, Reverdy Johnson, etc., etc. Incidentally, a great many other personages of national renown are introduced; and it may be said once for all that these pages abound in entertaining anecdotes, having an especial interest for the legal profession. Some few have a certain naïveté, illustrating the sectional defect in humor, from which our author is not exempt. His kindly face, as shown in the photographic frontispiece, seems to beam still more genially after we read, on page 22, of his morning call in Washington on John Quincy Adams: "A very genteel-looking negro boy met me at the door and invited me into the parlor. Knowing as I did the strong and bitter abolition feelings of Mr. Adams, I was somewhat surprised to find a negro in a menial capacity at his house"! But this confession, laughable as it is because made in sober earnest, is worth more for the light it throws on the Southern misunderstanding of the North than (let us say) Jeff Davis's two volumes on 'The Rise and Fall of the Confederate Government.'

Before the smile dies away in reflection, let us cite the following casual glimpse of a famous eccentric:

"It was on that occasion that Mr. Davis [Warren R. Davis, of S. C.] became acquainted with David Crockett, then elected to Congress. Crockett took a great fancy to Davis, and begged that they might sit together and room together. The first was assented to, but the latter rejected, by Mr. Davis. Many are the anecdotes I have heard Davis tell of Crockett. He said the first time Colonel Crockett spoke in the House he was evidently very much scared. When he took his seat he said to Davis, 'It is very strange that I should be afraid to speak here when I know I can whip any man in the House.' In writing home, Crockett showed one of his letters to Davis, and asked him how he liked it. Davis replied, the matter was very good, but his spelling was very bad. 'How can I do any better?' said Crockett. Davis told him to get a dictionary and look up the words. This Crockett did, and he was delighted. In returning thanks to Davis for his suggestion, he said he thought, with that little book, he could beat any man spelling in Congress."

The Southern love of oratory is conspicuous in the manner in which Mr. Perry speaks of one and another of his "countrymen." Burke, Cicero, Demosthenes are by turns invoked to

offer a parallel. Of Wm. C. Preston, who was a kinsman of Patrick Henry, we are told (p. 56): "I have heard Colonel Preston before popular assemblies, at the bar, and in the Legislature, and I never heard him on any occasion when he did not let fall from his lips some of the prettiest expressions and most heart-stirring words ever uttered by a public speaker." One of Mr. Preston's "pretty expressions" in Congress, not quoted by Mr. Perry, though it had some vogue in its day, was his declaration in 1833 that "if an abolitionist come within the borders of South Carolina and we can catch him, we will try him, and notwithstanding all the interference of all the governments of the earth, including this Federal Government, we will hang him." It marks the superficiality of our social classifications that this language of lawless savagery proceeded from a man not perversely described by Mr. Perry as "an accomplished gentleman," "amiable, kind-hearted, and generous."

The contrast just exhibited of course crops out in twenty places in this book when duelling and manslaughter are concerned. Mr. Perry himself appears never to have had a hostile encounter, though as a very young man he was engaged in an "affair of honor," and his intended course in it met the entire approval of Chancellor Dunkin (p. 209). He thinks it worth recording that, having asked J. L. Petigru "to go and hear a certain clergyman who had been in battle, and boasted of having killed one of the enemy," Mr. Petigru replied: "'No, Perry, I cannot listen to a homicidal preacher'" (p. 261). Such a common thing was it for conferences to be summoned by a man doubtful what "honor" demanded, that Judge Orr played a practical joke on his friends by gravely asking them to consult with him as to the propriety of his accepting a paper, which turned out to be his pardon from Andrew Johnson. "They thought, of course, it was a challenge, and they began to think of reasons which would justify a refusal of it" (p. 184). Judge Huger was Mr. Perry's "beau ideal of honor, chivalry, and manly character," and yet he gave this advice to his married daughter when parting from her: "If any difficulty [the peculiar Southern sense of this word may be supplied here] should ever occur between me and your husband, remember you are to take sides with your husband against your father." This, we presume, is an instance of the "Roman virtues" ascribed to Judge Huger, who was also capable of the following behavior:

> "The Judge, a short time after his marriage, challenged his brother-in-law, Major Rutledge. The Major, having been an officer in the army and a man of honor and chivalry, accepted the challenge, and then said to Mr. William Lowndes, who bore the challenge, that he would like to know what offence he had given. Mr. Lowndes, the intimate and bosom friend of the Judge, had to tell Major Rutledge that the cause of the hostile message had never been disclosed to him! [This exclamation-point is really Mr. Perry's.] They met and exchanged shots, and Rutledge was wounded, but no one ever knew the cause of their meeting" (p. 93).

This is a pretty picture of the requirements of "chivalry." We must reproduce one more, on account of the author's comment upon it. The story is of the notorious fire-eater, Yancey, who (by way of prelude) read law with Mr. Perry, and shocked him greatly by attempting to use his pistol on Thomas F. Gantt in the street! (again Mr. Perry's punctuation) on account of a political discussion:

> "In a quarrel with Dr. Earle, the uncle of his wife, he drew his pistol and shot him. The Doctor died in a few hours. Yancey was tried and convicted of manslaughter. In this affair, however, he did what few men of spirit might not have done under the circumstances. The day previous he had had a difficulty with Dr. Earle's son, who was quite a lad. Yancey sought the Doctor and explained to him the difficulty with his son, who [*sic*] seemed to be perfectly satisfied. The next day he was inquiring for Yancey with a bludgeon in his hands. Yancey went up to him in perfect good humor and anticipated no difficulty [!]. He gave Yancey the lie and drew his stick. Immediately Yancey drew his pistol, and, presenting it, told the Doctor to 'take it back or take a shot.' Dr. Earle rushed toward him and Yancey's pistol fired! [phraseology and punctuation both Mr. Perry's]. But Yancey assured me confidently that it was not his purpose to fire the pistol, and that he did fire it involuntarily under the excitement. He afterward made affidavit to this fact, and I have never for a moment doubted the truth of the assertion. He was defended by Judge Wardlaw, Mr. Burt, and myself. His sentence was fine and imprisonment," which Governor Noble pardoned in a few weeks" (p. 315).

As Mr. Perry was not in the counsels of the secessionists, we could not have expected any revelations of the inner working of the conspiracy from him. There is, nevertheless, a suggestive letter, too long to quote, written by Governor Pickens in 1857, which deserves to be read for its sketch of the "game" for the maintenance of Southern power. On the other hand, the student will not overlook Mr. Perry's not too grateful admission that the domestic reforms he had labored for all his life—"the destruction of the parish system, the election of Governor by the people, the election by the people of Presidential electors, the establishment of a penitentiary, the amalgamation of the courts of law and equity, the election of the judiciary for a term of years, and the separation of the State from all banking and banks"—could only be accomplished amid the ruins of the old commonwealth, and during his provisional governorship. In conclusion, we must remark on the too numerous typographical errors which disfigure this book, though they are seldom so important as the changing of Amos Kendall into "Randall" on page 27.

Christian Charity in the Ancient Church. By Dr. Gerhard Uhlhorn, Abbot of Loccum. Translated from the German with the Author's sanction. Charles Scribner's Sons. 1883.

It is impossible to speak without respect of a work which shows so much patient research and honesty of intention as this; and, within the limits adopted by the author, the student of primitive Christian institutions will find here gathered together and conveniently arranged much of the material that he requires. At the same time, the prejudices of the author, or perhaps rather we should say the preconceived theory upon which the book is based, deprives it of value as a contribution to the philosophy of history or of sociology.

The rubric of the first chapter, "A World without Love," shows us at once the theorem which is to be proved. Before the advent of Christ such a thing as true love and true charity was unknown to man. We are told (p. 39) that "it was only when through Christianity it was for the first time made known that every human soul possessed an infinite value, that each individual existence is of much more worth than the whole world—it was only then that room was found for the growth of a genuine charity." In order to prove this thesis, it becomes necessary to limit very strictly the definition of "a genuine charity," and accordingly we find that it is not the act of charity or mercy that is commendable in itself, but the motive which induces it; and Dr. Uhlhorn's test of motives is one which at once enables him to reject all good works save those of Christianity. He tells us (p. 60) that such works "possess true worth only in so far as they tend to the higher object, . . . the advancement of the kingdom of God." Now, "the kingdom of God" consists (p. 62) of "His own people," and was founded by Christ, so that necessarily all that preceded Him was worthless—Q. E. D.

It is true that Doctor Uhlhorn's honesty of purpose leads him to give the materials for controverting his own arguments. His studies apparently have not led him to an examination of the Oriental religions, and therefore we must pardon the omission of all reference to Buddhism, which, several centuries before Christ, had developed the idea of the common brotherhood of mankind and the inculcation of charity the most self-sacrificing, without at the same time estimating the worth of a human or of any other soul at more than that of an infinitesimal portion of the great animistic universe. But in so far as his investigations have led him, he fairly gives the evidence which tells against him. Thus book ii., chap. i., contains a very concise and interesting view of the internal social organization of the Empire and its working, showing that the feeling and expression of humanity among the pagans were not very different from those of Christianity; and in his remarks (pp. 41–2) on the influence of the Stoic philosophy in paving the way for the reception of Christian teachings, he allows us to see that its dissemination of the idea of charity in a truly Christian spirit contradicts totally the views advanced in the earlier portion of the same chapter.

It is perhaps, however, in his treatment of charity as developed under the Old Law that his onesidedness and prejudices become most apparent. It was necessary for him to prove that even Israel, under the Covenant, was "a world without love," and this, with the aid of Eisenmenger, is a comparatively easy task. But no one who is really acquainted with the inner workings of the post-exilian church of Judea, and with the refinement of sentiment which rendered possible the training of such beings as John the Baptist, and Christ and his disciples, and Hillel and his school, can regard Doctor Uhlhorn's view of that church as anything but a caricature. In fact, he has one standard for the Jew and another for the Christian. When he quotes from the Emperor Julian (p. 55) that there were among the Jews of that period no beggars, he admits that there was among them plenty of alms, but he adds that there was little charity. When, however (p. 125), he states of the early Christians that "the object aimed at and actually attained was that no member of the Church should suffer want," he evidently regards this as a proof of the largest measure of charity. So, when the Jews refused to receive alms from the heathen, it was a sign of uncharitable exclusiveness (p. 55); but when the Church refused gifts and oblations from sinners and heretics (p. 148), it does not in the least detract from Christian charity, but rather enhances its character. When, among the Jews, alms were considered as an atonement for sin (p. 54), the idea of an advantage to be gained by the act reduces it almost to a level with a mercantile transaction—it is one of the "symptoms of a legal bondage" (p. 52); but the feeling of the early Christians that oblations were sacrifices to God is worthy of all praise (p. 149). It is only just, however, to add that Doctor Uhlhorn's definition of Christian love and charity is so rigid that he regards their primitive purity as already tarnished so early as the time of Cyprian, when "alms have already become a propitiatory and meritorious work" (p. 153). Yet, seeing that they so soon became assimilated to non-Christian virtues, one cannot well help asking whether it was worth the author's while to establish so elaborately a distinction founded upon differences so delicate and so transitory.

The translation is fairly well executed, though an occasional Teutonism grates upon the ear.

The translator surely ought to know that the equivalent of "römisch" is "Roman," and that he might as well speak of the Romish Empire as of the "Romish *collegia*" (p. 141), or of the "Romish council of 721" (p. 408). It would be difficult to characterize too severely the arrangement of the notes and references in a huge mass at the end. To the superficial reader the appearance of the page undefaced by foot-notes may be more attractive, but all students who chance to consult the book will rightfully protest against the gratuitous labor imposed on them.

Virginia: A History of the People. By John Esten Cooke. [American Commonwealths.] Boston: Houghton, Mifflin & Co. 1883. 12mo, pp. 523.

THE new series of "American Commonwealths" begins appropriately with 'Virginia,' by a well-known writer. It need not be said that it is written in a fascinating style, and animated by a spirit of strong love for the author's native State, and pride in its history. It should be said further that it brings out many an obscure or forgotten bit of history, and makes real an epoch which is familiar to very few. Our historians are mostly from the North, and it is not strange that, from the time that the history of the Northern colonies begins, these should take a leading place in their works. Mr. Cooke sees things with the eyes of a Virginian. He has been able, moreover, to do what no Northern historian could do—to draw materials abundantly from "forgotten pamphlets, family papers, the curious laws passed by the Burgesses, and those traditions of the people which preserve the memory of events in the absence of written records." The result is a very graphic and truthful delineation of the life of the people, and their collective action in the commonwealth.

In any treatment of the early history of Virginia, the critic naturally turns first to the story of Pocahontas and her relation to Captain John Smith. On questions of controversy every man is entitled to his deliberately formed opinion, and we are not disposed to censure Mr. Cooke for seeing things with the eyes of a Virginian. He has, moreover, presented the arguments for the traditionary view very strongly. We do not see, however, how any unprejudiced person can read carefully the two accounts of these events, in the 'True Relation' of 1608 and the 'Generall Historie' of 1624, without being convinced that the story in question was foisted into the latter account, and is not entitled to any acceptance. It is not merely its omission in the earlier account—that could be explained, although it is hard to see how so romantic and striking an incident could have been passed over without notice by every writer of those years; it is its entire inconsistency with the account of the courteous and friendly reception given Smith both by Powhatan and by Opecancanough, whom he calls "this kind King." In the 'True Relation,' after describing the style of Powhatan's court, which "draue me into admiration to see such state in a naked Saluage," he goes on to say: "Hee kindly welcomed me with good wordes, and great Platters of sundrie Victuals, assuring mee his friendship, and my libertie within foure dayes." This was his reception as described the next year; and we cannot in any way reconcile this authentic account with that given seventeen years later, when the Indians had become unfriendly. In this same account, too, in justifying the rashness of his expedition, he begs his critics to "well consider the friendship of the Indians," etc. Against this judgment, which we venture to say every impartial person accustomed to weigh historical evidence would pass, Mr. Cooke brings up certain considerations which read plausibly, but which we think have no real weight. The first is (p. 71) that the editor of the 'True Relation' confesses that some parts of the original account were omitted, which he thinks were "Smith's adventures on the Chickahominy and York." This is, however, a mere guess, and avails nothing against the positive contradiction mentioned above. The next argument is the "deep interest in Smith" taken by Pocahontas and her influence over him. "When some Indians were arrested by Smith, Powhatan sent Pocahontas to intercede for them, and they were released at once, 'for her sake only.'" But these words, "for her sake only," have no more weight as evidence than the story itself; for they are, like that, taken from the 'Generall Historie.' The words of the 'True Relation' are: "We guarded them as before to the Church, and, after prayer, gaue them to Pocahuntas, the King's Daughter, *in regard of her father's Kindness in sending her.*" The first allusion made to his rescue by Pocahontas is in Smith's letter to the Queen, in 1616, *which, again, is only known from its being copied into the 'Generall Historie'* of 1624. We cannot think, therefore, that Mr. Cooke has in any degree weakened the force of Mr. Deane's arguments against the authenticity of the story.

We find an error of statement on page 506, in relation to the process of reconstruction in Virginia. "In the spring of 1865 . . . Francis H. Pierpont, who had been Governor of West Virginia, assumed executive authority by direction of the Federal Government." Mr. Pierpont was never Governor of *West Virginia.* He was made Governor of *Virginia* by that part of the State (chiefly that which is comprised in the present State of West Virginia) which remained loyal when the State passed the Act of Secession. The constitutionality of this action is a matter of interpretation, and is open to difference of opinion. Of course Mr. Cooke, believing that the State had a constitutional right to secede, and had seceded, would deny the authority of Governor Pierpont's government; the United States, however, acting on the theory that the Act of Secession was totally invalid, recognized this authority. Further, when the State of West Virginia was set off from Virginia by an act which, however constitutional in form, must be pronounced rather elastic in spirit, Governor Pierpont did not even then become Governor of the new State, but continued *Governor of Virginia,* with his capital at Alexandria, and his authority practically limited to the territory occupied by the national troops. Furthermore, his reorganization of the State Government at Richmond in 1865 was not "by direction of the Federal Government," but only by its recognition: President Johnson's proclamation says that in the reëstablishment of peace and order "Francis H. Pierpont, Governor of the State of Virginia, will be aided by the Federal Government, so far as may be necessary," etc.

There is a pardonable slip on page 447, where it is said that "Lord Howe had defeated Washington on Long Island." Lord Howe was Admiral; his brother, Sir William Howe, was commander-in-chief of the British forces.

Dynamic Sociology; or, Applied Social Science, as based upon Statical Sociology and the less complex Sciences. By Lester F. Ward, A.M. D. Appleton & Co. 1883. 2 vols. 8vo, pp. 706 and 690.

BECAUSE the mind moves in an evolutionary, systematic way, Mr. Ward begins his sociology with physics and biology, proceeding, like Comte and Spencer, whom he summarizes at length, from "primary aggregation," or chemical and astronomic phenomena, through "secondary aggregation," or biology, psychology, and anthropology, to "tertiary aggregation," or "sociogeny." All previous social philosophies have been statical—passive or negative—as Mr. Ward says Mill, Spencer, and Fiske are, because they have regarded genetic rather than dynamic or teleological agencies in society, to which the author devotes most of his second volume. Conation, or the struggle for happiness, is as universal in society as the struggle for existence in lower animal life, and is directed to six ends—viz., utility (as measured by happiness), progress, action, opinion, knowledge, education—the last of which is an ultimate, while all the rest are proximate ends of conation. Education—which is arbitrarily distinguished as of experience, discipline, culture, research, and information—is the most important means toward securing the teleologic, artificial civilization, or organization of happiness, which is the all-including problem of dynamic sociology.

Into this general scheme the author has woven a great number of such facts and illustrations as may be gathered from a wide reading within the English literature of evolution, and has added not a few suggestive insights, explanations, etc., of his own, so that at least his work is a valuable thesaurus of interesting matter to those not already familiar with the new school of literature which has grown up about Darwinism, etc. When the author tells us, however, that all previous social science is sterile, that every big doctrine has entered the world in a big book, and that he could not make his own smaller; and when he formally iterates and often elaborates such ideas as that history is past politics, that we need scientific legislation, that the shortness of life retards progress, that by the establishment of sanitary priesthoods we should guard our health without the doctors, that inventors need independence, that those are best paid who support the established state of things, that the great differences between men are differences of opportunity and of information—he betrays a self-consciousness and a piddling neologism which are anything but scientific. With less formal elaborations and commonplace padding the book would be admirable, and, on the whole, new and fresh; but as it is, its merits are spread so thin that the well-read, and especially the expert, reader will hardly be likely to do them justice.

Moreover, the author's fundamental idea is not entirely satisfactory. Civilization is by no means entirely a product of dynamic or teleologic agencies. When men thought they were doing one thing by one set of agencies, deeper genetic influences, unsuspected at the time, were doing very different things by a very different set of agencies. Very little in the world, even of art and literature, is the product of premeditation and conscious design; and civilization as a whole is about as teleological as language as a whole. Again, as this is not Hartmannism, so it would have been no Rousseau-like social scepticism to confess that civilization and the artificial generally are not quite so wholly good as our author assumes. His thoroughbred evolutionism one might suppose would have made him more trustful of the laissez-faire motives within the field of sociology. His book might please the German Socialists, who love a little more dictation of ends and means by government; but no others would call it practical. And yet, again, the distinction between the genetic and teleologic, as our author makes it, is both interesting and instructive.

Modern Painters. Vol. ii. By John Ruskin, LL.D. Rearranged and revised by the Author. John Wiley & Sons.

WE are inclined to accept the second volume of

'Modern Painters' as, on the whole, that of Mr. Ruskin's work which will, except maybe 'The Stones of Venice,' have the greatest value for the future. It certainly is that which deals with the gravest matters; and the fact that it greatly fails will not make it of less value as a contribution to that which, when it becomes a science, will become so by numerous failures and partial successes having paved the way to secure conclusions.

Ruskin has not perceived that the prime necessity in the elaboration of any science is a correct and complete nomenclature, and this he has never attempted to lay down in any branch of his art studies. He has nowhere given a comprehensive definition of art, or one which would satisfy all his own variations of the theme; and in this study on the nature of beauty and imagination he has evaded always a precise and concise definition of either, by writing all round and explaining them without risking a formula which might at some stage of his demonstration embarrass him. He has, in the opening chapters of this volume, said more on the true nature of Beauty than any one besides has ever said, though, had he read Swedenborg, he would have found the germ of all his theories; but he confuses from the outset the nature of Beauty by dividing it into typical and vital, whereas the latter division has no generic relation to the former. He makes one branch of Beauty absolute and intuitive as to its perception, while the other is an idea of fitness, which is relative and a matter of reflection and perception of relations, not, as he maintains typical beauty to be, self-evident. Again, he makes no sort of recognition of the distinction between the sublime and the beautiful, without a precise statement of which no final conclusion on the matter can be reached.

The same confusion arises in his treatment of Imagination, where he confounds Imagination proper (or, as he terms it, "Imagination associative") with Sympathy, which he considers as "Imagination contemplative"; his "Imagination penetrative" hovering between the two, sometimes taking the form of one, sometimes of the other. No writer has yet accepted Ruskin's classifications or definitions, and we imagine none is likely to do so, any more than his coinage, "Theoria" and "theoretic," in place of Taste and æsthetic. Nor are we likely to encumber our nomenclature with three forms of Imagination—at least, not till we are able clearly to settle the nature of one. There is a grave question behind all this, and one we must determine first: whether Beauty is absolute or merely the result of association, direct or inherited, mixed with perceptions of fitness. Ruskin assumes the former, but in nowise proves it. He makes, in fact, here as in all his works, the great mistake of taking his perceptions and standards as absolute and universal: what he sees and feels, all healthy minds ought to see and feel. We might be disposed to deny altogether his mental fitness to constitute himself a standard, and *pro tanto* his whole structure falls to the ground.

This edition, with its revisions, etc., gives some insight into the nature of the contradictions which are the perplexity of Ruskin's more independent readers. One sees in his early orthodox art-education the basis of his appreciation of the great standards, as traditional with him—part of his mental fibre; but against it rise in a continual antagonism, and oftenest triumphant, his individual inclinations to a pure naturalism. There is also a key to his inconsistent measurements of the greater artists in the evidence which this volume shows, more clearly than any other, that the author has always judged a work of art by the purpose of it—the thing to be done, not the manner of doing it. His standards are ideal or moral and intellectual, not technical, which the artist's standard is. With regard to the former, no one will deny his competence; as to the latter, the art world is every day more and more disposed to deny him any authority as a proper art critic.

The Life of Schiller. By Heinrich Düntzer. Translated by Percy E. Pinkerton. With authentic illustrations and facsimiles. London and New York: Macmillan & Co. 1883.

No standard life of Schiller exists in English, and no adequate and thoroughly satisfactory biography in German. Carlyle's monograph served a useful purpose at the time of its appearance, but was written to supply an existing want, and, though appreciative, is very incomplete. Hoffmeister's large work presents a mass of material, but fails to reveal the poet in his true personality. Of the numerous shorter lives, Palleske's is perhaps the best, but none has been accepted as an adequate estimate of his genius. In this respect Schiller has not fared as well as his great contemporary Goethe, in the lives by Grimm and Lewes. The present work is one of three which the author has published within a brief time, designed to embody the results of his studies in the lives of the three great writers of his country—Goethe, Schiller, and Lessing. This is the first volume that has been translated into English. Those who are familiar with Düntzer's previous works have found them diffuse, and their value impaired by an unmethodical arrangement, and by dreary and incessant discussions. These objections do not lie against his 'Life of Schiller,' in which the march of events is recorded with the regularity of a chronicle. There is no diversion, no uncertainty; all is stated as positive and irrefutable. The book is as dry as a genealogical record. The author is destitute of imagination, and has no charms of style. If the reader desires to understand the friendship of Schiller and Goethe, and the influence which one exerted upon the intellectual life of the other, he will be disappointed here. Körner's wise counsel and generous aid, which supported the poet in the most hopeless period of his life, are but faintly characterized. The double relation of Schiller to the sisters Charlotte von Lengefeld and Caroline von Beulwitz, which was first shown by Hase in publishing the 'Literary Remains of Caroline von Wolzogen,' presenting such a curious psychological study, is not referred to. No adequate description is given of Schiller in his social life. He has often been extolled at the expense of Goethe, but in fact Schiller had no preëminence in virtue over his contemporary; he was neither better nor worse than others of his time. The incense which is burned to the "pure" Schiller, especially by the fair sex, is due to the lofty ideal of woman in his writings.

The translation requires at once a careful and thorough revision. The baldness of the author's style is reproduced and increased in an English dress. There is no easy flow of the sentences, and familiar thoughts are expressed in a foreign and unfamiliar manner. Trifling omissions from the original text are apparent. Evidence abounds that an independent knowledge of the subject-matter is essential to a successful translator; mistakes appear which are quite inexplicable. The family name of Schiller's wife, Lengefeld, which is of frequent occurrence, always appears as Lengenfeld; Corona Schröter, one of the best known characters of the Weimar circle, is given as Corona Schröder, Grieszbach as Griessbach and Griesbach, "Welsch" (p. 225), Italian, is left untranslated; while "Elbflorenz" (p. 178) and "Ihnathen" (p. 196) seem to have baffled the translator, and are unchanged. The English reader would scarcely recognize the Florence of the Elbe and the Athens of the Ihn in these forms. Gustav Adolph (p. 298) appears in the German form, Garve's (p. 301) as "Garves," "Hessen" (p. 13) as Hesse; Louis the Fourteenth is twice rendered "Louis Seize" (pp. 307, 308). In general there is no uniformity in representing titles and proper names, but the German and English forms often appear side by side. Thus, we have Kurpfalz (p. 84) and Kurfürst and Electoral (p. 287); "Rittmeister" (p. 5), "Oberst" (p. 94), "Hofmeister" (p. 340). *Von* is often capriciously omitted—as, Princesses Rudolstadt and Sondershausen (p. 441); and *Mercur* (p. 216) and *Thalia* (pp. 235, 242) appear without the article. Books whose titles have a fixed form in English are mentioned so that they are not always recognizable. Kant's 'Kritik der Urtheilskraft' is translated on page 303 as "Critique of Reasoning Power," on page 332 as "Critique of the Judgment." The translator possesses a unique vocabulary, and it is not always clear whether his words are simple affectations or unconscious colloquialisms; but it would require too much space to point them out.

The volume contains numerous pictures of Schiller and his friends, and of the scenes associated with his life; also, facsimiles of letters and poems. These are evidently printed from duplicate plates of the German edition. It would have been wise enterprise on the part of the publishers to have the illustrations reëngraved, as the execution of many is rude and poor.

BOOKS OF THE WEEK.

A Sylvan City; or, Quaint Corners in Philadelphia. Fords, Howard & Hulbert.

Baird, Prof. H. M. History of the Rise of the Huguenots of France. New ed. 2 vols. Chas. Scribner's Sons. $3 50.

Bancroft, G. History of the United States of America, from the Discovery of the Continent. The Author's last Revision. Vol. iii. D. Appleton & Co

Bickerstеth, E. My Hereafter. Cassell & Co.

Brown, I. Elements of the Law of Domestic Relations and of Employer and Employed. Boston: Soule & Bugbee.

The Nation.

NEW YORK, THURSDAY, OCTOBER 18, 1883.

The Week.

THERE is a disposition on the part of Republican authorities in all parts of the country to take a cheerful view of the Ohio defeat, and to say that they will come out all right next year. Some of them base their hopes on the belief that the temperance question will be less damaging to them, and others think the popular mistrust of the Democrats will be their party's salvation. Mr. Halstead expresses the latter view tersely when he declares his belief that "when the people are jammed right up to the question of trusting the general Government to the Democratic party they will say 'no' again." There is always risk in trusting to the superior wickedness of the other fellow for one's own salvation. The people have been "jammed up" to that question several times already, and have come dangerously near to taking the risk of giving the other party a chance to show what it would do. The result in several States last fall, and in Ohio this year, shows that the risk is likely to be greater than ever hereafter. The best way for the Republican party to meet it is to adopt and follow such a policy as will deprive the contest of all appearance of being a choice of evils.

Butler opened his campaign for reëlection with three meetings in Boston on the 10th inst., and made speeches which indicate that he accepts rather joyfully the Republican challenge to confine the issue to Butlerism. He said the people must decide for Butler or the Marshes, and dilated with even more than his usual unction upon his love for the "poorest and lowest" among the population. The most significant portion of his utterances was the frank admission that he is a candidate for a Presidential nomination. He had already said in Washington that he was convinced that there would be a formidable third-party ticket in the field next year; that the two millions of workingmen would demand a candidate. He now spoke of himself, with sufficient plainness, as just the kind of candidate likely to be wanted, by saying he was a "man capable with one hand of reaching down to the poorest and lowest and giving them help, and with the other grasping the highest prize within the gift of the people." His faith in the popularity of his own methods is apparently stronger than ever; if it were not he would be able to see that, outside of Massachusetts, he has no appreciable standing as a Presidential or any other candidate.

This open avowal of his Presidential aspirations, by the way, is having an amusing effect upon both national parties. The Democrats are curiously troubled about it, and are attempting many ingenious excuses for supporting his candidacy for Governor while opposing his designs upon their National Convention. Senator Bayard says that "while the local interests of Massachusetts may demand such a leader," the national Democratic party does not, and has too many tried and true leaders to seek such a "double-tongued standard-bearer as Ben Butler." Among Republicans there is a natural willingness to see Butler wax strong enough to capture the Democratic nomination next year, and the complaint comes from Boston that many of the Republican leaders in other States are so eager for this to happen that they are holding aloof from the Massachusetts canvass, regarding the sacrifice of the State for another year as of slight account compared with the great gain of having Butler as an opposing Presidential candidate. This gives Butler a unique position in national politics, and attaches an importance to his aspiration which is absurdly exaggerated. We can conceive of no circumstances under which the Democrats would be capable of the incredible folly of nominating him for the Presidency.

A curious report comes from Washington that the friends of Blaine and Conkling are making a combination for next year. Their plan is to have Blaine made the Republican candidate for President, and Conkling sent back to the Senate from New York. They declare that the "people are demanding" the return of both men to public life, and that, in accordance with their life-long practice of bowing obediently to the popular will, both are prepared to sacrifice any personal feelings they may have harbored toward each other in the past. The handsome estimate of Conkling's abilities which Blaine has put into his "history" is said to have had a most soothing effect upon the ex-Primate, and he is eager to return the favor by supporting Blaine for the Presidency. When we consider that one of these statesmen says he is happier in the practice of the law than he ever was or can hope to be in political life, and that the other has been cherishing the hope that he would be permitted to pass the remainder of his days in the peaceful occupation of historical composition, the magnitude of the sacrifice is at once apparent. We have no doubt that the country will be deeply moved by the spectacle.

The President has decided, in an Illinois case, that the appointment of internal-revenue collectors belongs to the Senators of the party in power, and, inferentially, that it is legitimate for them to use these, as well as other places, to reward workers. This, of course, is not civil-service reform, nor good Republicanism either, for the theory has been strongly condemned in Republican platforms. But it must be said in excuse for President Arthur that it is as far as the reform has yet got. The use of patronage by Senators for their own purposes has been stopped as regards the greater part of the public service. It will probably be stopped as regards the remainder in time, but not until a President has been elected who is really in earnest about the matter—that is, who has taken it up not because public opinion has forced it on him, but because he himself believes in the necessity of it. At present the aim of most men in public life is to get along with as little civil-service reform as possible. They are dodging it, and trying to minimize it, just as they used to dodge and minimize the hostility to slavery.

The practice which has begun to be resorted to of slipping in "workers" in the grade receiving less than $900 in the Custom-house, which is not covered by the present civil-service rules, has led the Civil-Service Commission to ask the President to extend the classification so as to cover this grade also by the competitive system, and it will probably be done. It certainly needs to be done, as recent events in the Custom-house here show. In fact, so widely diffused and so determined is the opposition of the old hacks to the new system that apparently hardly anything can be left to their discretion in the use of the appointing power. Keeping them from the spoils is very like keeping an old toper out of the way of liquor—so numerous and ingenious are their devices for getting some of "the hair of the dog that bit them." One of them, the Assistant Postmaster-General, known as Frank Hatton, who is allowed to edit a newspaper and make the postmasters canvass for it, openly pronounces the competitive system a "fraud," and of course evades it or nullifies it in every way he can, and the President takes apparently no notice of his antics. This sullen opposition will probably last for some time, and will call for all the vigilance the friends of civil-service reform can muster.

The general trade and financial situation presents more conflicting features than usual. At the West there has been for several weeks, and is yet, a larger movement of grain and cattle to market than in the same period last year, and in some particulars even larger than in 1881, which was the year of the greatest crops on record. This has stimulated various branches of mercantile trade in that part of the country. But the great lines of industry embraced in the iron trade are still as depressed as they have been at any time in the past year. The production of both coal and iron has been in excess of the demand, which the reduction of $1 per ton on pig-iron does not seem to improve; and though the coal trade is experiencing the usual activity incident to the beginning of cold weather, the fact that the product of the anthracite coal companies has been 2,000,000 tons (or 10 per cent.) greater in the nine months to October 1, 1883, than in the same period of 1882 without any corresponding increase of demand, is given as a reason for the probable curtailment of the production during the next three months. The railroad earnings for September were good, and showed a gain of 8 per cent. over those of September, 1882—not quite equal to the increase of mileage. Confidence in railroad property has, however, been greatly shaken. Railway stocks have declined steadily for months, and in the past

week the decline in some stocks has at times been almost panicky. Railroad bonds have been a little stronger than the stocks, but even in these, and especially in the speculative bonds, the decline has been large. Money is abundant—abnormally so for loan on collateral security, at rates lower than have ever prevailed at this season of the year. At the same time more capital is being turned out of investment in Government bonds by the repeated calls for more bonds for redemption. The call for $15,000,000 on Saturday makes $62,000,000 that have been called since August 12.

Mr. Knox, the Comptroller of the United States Treasury, made last week at the Bankers' Convention a suggestion which has at least the merit of novelty, and will probably be found to have others on further discussion. In view of the approaching disappearance of the United States bonds, on which the currency of the national banks is now based, and the strong probability that in the near future no State will have any outstanding bonds worth mention for this purpose, he proposes that the banks should be allowed to deposit the securities of certain foreign governments—such as English consols, French and Italian rentes, which are very certain not to be paid off within any period we need think about, and are at the same time perfectly safe and can always be disposed of in open market. The use of them, too, would save us the necessity of troublesome legislation, and remove one debatable and not easily settled question from our politics. The easiest bond to manage is, undoubtedly, somebody else's bond, if it is perfectly safe.

Western Republican Congressmen do not approve of the plan, which it is said the Comptroller of the Currency favors, of making a new bond adapted to the needs of the national banks—the Government to give a new 3 per cent. bond and $15 in money for every 4 per cent. bond outstanding. When this plan was first mooted we were of the opinion that, although the Government would lose nothing by the operation, yet a project which would require so much explanation in order to enable common people and even common Congressmen to understand it would have small chance of adoption. Judge Payson, of Illinois, who is not a common Congressman, is said to be very earnest in his opposition to the plan. He says that "Congress will never consent to redeem any bonds at a premium." We think that he is quite right in his judgment of what Congress is likely *not to do*—all this being quite apart from the merits of the plan. Reduced to its simplest terms, the Comptroller's idea is that the interest on the proposed 3 per cents for the time they will have to run, plus the $15 premium, will be equal to, or no greater than, the interest on the 4 per cents for the same time, while the banks will have a strong inducement to make the exchange, being able to use the premium which is now locked up in the price of the fours. This ought not to be a difficult thing to understand; but the idea of redeeming bonds at a premium is likely to be the first thing presented to the mind of the voter, and the one so much the more readily grasped that the explanation would only become clear to him after the polls were closed.

Mr. Wharton Barker's plan for avoiding the reduction of import duties by dividing the surplus revenue among the States, so as to relieve them of the necessity of local taxation, has had such poor success that the Protectionists have been looking around for a new one, and have apparently discovered it. It appeared in the *Tribune* on Monday in the form of a reproof to stupid Protectionists, whom it accuses of blundering. The blunder is in supposing that to reduce revenue you must reduce duties, when it is as plain as the nose on your face, that you can reduce revenue still more effectively by making the duties so high as to stop importation altogether. Accordingly the *Tribune* proposes, in the form of a correction addressed to Protectionist dunderheads, that in order to cut down the revenue derived from steel blooms, for instance, we should, instead of lowering the present 45 per cent. duty, raise it to 70 per cent., under which steel blooms would yield no revenue whatever. A Protectionist who never thought of this must certainly be an unconscionable donkey, and we have not a word to say for him. But it is, nevertheless, questionable whether the country will receive with satisfaction a proposal to remedy the height of the tariff by making it higher; it is so like the plan of curing a headache by cutting off the head. Its appearance, however, at this stage in the discussion lights it up with a touch of humor, which is what the tariff discussion has always needed to make it popular.

The great Senatorial inquiry into the condition of the laboring classes has been transferred to New Hampshire, where it is now carrying on its amusing work. A Catholic priest has demanded that it investigate the quality of food furnished in boarding-houses, which is perhaps as useful a field of research as it could enter on. Considering the part that hash plays in the modern world as an article of diet, the fact that it has thus far escaped official examination, and (so far as we know) has never been reported on by any commission, parliamentary or other, reflects but little credit on modern legislation. Moreover, there are probably no places in the modern world so full of discontent of one sort or another as boarding houses, and therefore none worthier of the penetrating eye of the Congressional Committee. That the Committee will reach any useful conclusion in the matter we greatly doubt, for they are almost sure to present a majority and minority report, one backing up the boarders, and the other the landlady; but the investigation would let light into these dark places, and light is what the modern world seeks on all subjects.

A proposition to abolish contract convict labor in the State prisons is, by direction of the last Legislature, to be submitted to the voters of the State at the coming election. The success of the proposition would simply mean the condemnation of the convicts either to idleness and all its attendant corruption and demoralization, or else to what is almost as corrupting and demoralizing, besides being disheartening—useless labor. It would, moreover, convert the prisons, which are now self-supporting, into burdens on the hard-working taxpayers of the State, who are under no obligation whatever to support an able-bodied man out of the proceeds of their industry because he has committed a crime. As might have been expected, however, the "Democratic masses" in this city are supposed to be in favor of it, and the Aldermen are making preparations for the vote by ordering the printing of 2,000,000 ballots in favor of the proposition. It behooves its opponents in both parties to see that negative ballots are also ready, so that the large body of Tammany men who every year pay visits of greater or less length to the penitentiaries may have at least one experience in their lives of the pleasures of useful industry.

At intervals of two or three years the public are surprised to find that a cash demand exists in some part of the civilized world for Confederate bonds. The price offered and paid is only a few cents on the dollar, but that any price at all should be paid for them is sufficiently astonishing to set everybody guessing what motive, or what conception of law or political economy, can lie at the bottom of so unaccountable an investment of one's money. The conundrum is answered by a letter written by one J. B. Gelder, "Secretary *pro tem.* of the Confederate States Bondholders' Committee," dated at 80 Coleman Street, London, and published in the *Herald*. The substance of it is that certain "eminent jurisconsults" in Europe have given the opinion that these bonds are a valid claim against the several States which constituted the Southern Confederacy during the war, and that the United States ought of right to repeal the prohibition embodied in the Fourteenth Amendment of the Constitution against the payment of this valid claim by the said States. The inclination of these States to pay the debt if all Constitutional obstacles were removed, is a missing link in Mr. Gelder's financial scheme. The suggestion that such States as Virginia and Mississippi, which openly repudiate debts contracted in time of peace, and against which no Constitutional inhibition lies, might be willing to pay off the Confederate bonds, is really humorous. The case reminds one of the Western wag whose wife had left his bed and board, and who cautioned the public by advertisement not to trust her on his account, adding that as he was not in the habit of paying his own debts, he should not trouble himself about hers.

Southern papers are beginning to protest in earnest against the homicidal tendencies of the South. The *Evening Journal* of Atlanta has from the first been active in the cause of law and order. The *News and Courier* of Charleston, S. C., one of whose editors has had the moral courage to decline a challenge, upon the ground that duelling is in every way obnoxious to him, has unwaveringly denounced the fierce life-taking disposition which Southern society develops.

The *Courier-Journal* has—not without manifold misgivings and some remarkable inconsistencies—directed its energies in the way of reform. The press of Florida has some representatives who are in no way behind these in their strenuous efforts to rid the South of the private avenger and the duellist. But the *State Chronicle*, of Raleigh, N. C., which has just come into the journalistic field, promises to be the most vigorous and effective foe of lawlessness which has yet arisen in the South. In a recent editorial, while it denies "the sweeping conclusion that is sometimes drawn, that our whole civilization is tainted with the spirit of murder," it declares that "it is simply an unfortunate fact that too many men in peaceful and prosperous North Carolina are dying in their boots." The *State Chronicle* is the only Southern paper that we have known to go so far as to object to the killing by an individual of one who has injured a woman's honor. Nothing could be more excellent or timely than its appeal to the other State papers to aid in making "firearms less fashionable." It strikes at the root of the matter, when it says to its Southern contemporaries: "When a murder is committed, a report of it and the usual regrets of the 'unfortunate occurrence' are not enough. Say how it happened. Call a murderer a murderer. This is the proper way to deal with them. The severe punishment of bold truth and plain language is a greater reformatory power than a hazy fear of the gallows."

A large audience at the Academy of Music on Thursday had an opportunity of hearing one of the best of English contemporary orators—Lord Coleridge—make a very graceful speech, by way both of thanks and farewell. It is very difficult now either for an American speaker addressing an English audience, or an English speaker addressing an American audience, to say anything very new about the relations of the two countries; so that the main interest of Lord Coleridge's speech was derived from the fact that his remarks contained the impressions of the holder of what is perhaps now, considering the dignity and security and popular respect which surround it, the greatest judicial office in the world, about the American people. He devoted himself mainly to a comparison of the courts and procedure of the two countries, and had a good word for each; declared himself in politics a Radical of the Bright school, and uttered a perfectly polite and by no means inapt warning against allowing our pride in our material growth to make us forget how much greater in all matters, social, political, and moral, is the importance of quality than that of quantity. He wound up, too, with a very appropriate snub to the now rapidly-diminishing body of English critics who think the evils of this country could be cured by a monarchy, aristocracy, and an established Church, and that any country which wants these things has only to order them at a factory.

There is still apparently the greatest doubt on the other side of the water as to who is to defend O'Donnell, in spite of the despatch of Mr. Pryor, whose arrival the *Irish World* expects to cause a terrible commotion "among the wigs" in the British courts. The reason of this is, we presume, that the brethren over there know very well that Pryor will not be allowed to turn the court into "a hall" for a stump speech on Irish wrongs. O'Donnell's attorney says, moreover, that he is short of money for the defence, his funds being already exhausted in gathering witnesses, and he would probably have liked Pryor's passage money and other expenses. The story that Mr. Charles Russell, Q. C., has been retained for the defence is, we believe, untrue. In fact, neither of the reported pleas to be used for the prisoner—self-defence and insanity—needs to be supported by great forensic talent. Self-defence is a matter of fact, easily proved, if provable, and the question of insanity does not take long to settle in English courts, especially if, as so often in this country, the insanity produced is the variety which drives a man to commit a murder, but leaves him perfectly sane for all the other business of life.

The one question of importance now pending between England and France is the compensation to be made to Mr. Shaw, the Madagascan missionary, whom the late Admiral Pierre seized and kept in close confinement on board a man-of-war for two months. The amount, about $12,000, has been, we believe, already settled. Various charges were made against him—all ridiculous, such as that he had left bottles of poisoned claret within reach of the French troops—but were successively abandoned without trial, so that what his offence really was nobody knows. His food was of the coarsest kind, and his wife was refused permission to see him. His case has naturally made a great stir in England, where what used to be called "Exeter Hall" has taken up his cause with much fervor. The best defence the French had is one which appears to be very well established, namely, that Admiral Pierre was out of his mind through the disease which soon after caused his death, when he was persecuting Shaw; but with curious perversity the press refused to adopt it. Even John Lemoinne, the crack writer of the *Débats*, argues that Shaw, being a missionary, should not complain of coarse fare, because this is what missionaries ought to expect, or of being denied the society of his wife, because missionaries ought not to have wives.

Seldom has a government, in a perplexing affair of state, shown greater tact and firmness than the Hungarian Ministry has evinced in the Croatian question. M. Tisza had scarcely perceived the dangerous character of the outbreak in Agram and the Zagorie district, when he made up his mind to use unbending energy first and conciliation next. His Cabinet seems to have been a unit on the question, but the common ministry of the Austro-Hungarian monarchy had to be won over to the same policy. This achieved, the riots, which were assuming the appearance of a general revolt against the authority of the Hungarian Crown, were rapidly quelled by the unsparing use of military force, while promises of liberal concessions to the rational demands of the Croats were made to an assemblage of Croatian notables convened by the Hungarian Premier. But these concessions had to be granted by the Diet of Buda-Pesth, which was not in session. Before its reassembling, Tisza repaired to the country of Bihar, of which he is one of the representatives, and there, at a banquet given him by his constituents, outlined his purposes in a speech of great force, in which he declared that, after having proved the determination and the power of the Government to uphold its constitutional rights and defend law and order against revolutionary uprisings, it was his determination to exhibit in this question of conflicting national rights a spirit of conciliation corresponding in degree to the energy employed in stifling rebellion, and that on this policy he staked his position both as Premier and Representative. The seriousness of the situation, which had become clear to the people, gave this announcement of the resignation of the Cabinet, in case the Ultra-Nationalists should triumph, a decisive effect, and both Houses of the reassembled Diet, as the latest despatches from Buda-Pesth tell us, hastened to sanction the Government propositions, although no less than the removal of all inscriptions in the Hungarian language from the office signs in Croatia, and the leaving of the exclusively Slavic inscriptions, was demanded.

It is a curious coincidence that, at the moment when a sudden political revulsion emancipated Bulgaria from the sway of her Russian military guardians, and thus deprived the diplomacy of St. Petersburg of a main reliance in its operations in the Balkan Peninsula, a similar revulsion handed over Servia, whose young King had so ostentatiously thrown himself into the arms of the Austro-German alliance, to the guidance of a parliamentary coalition decidedly friendly to Russia. The signal triumph in the late elections to the Servian Skupshtina of the Opposition, led by ex-Premier Ristitch, over the supporters of the pro-Austrian Pirotchanatz Ministry, is an offset to the victory achieved by ex-Premier Zankoff, through the action of the Assembly of Sophia, over the Cabinet headed by the Russian General Soboleff. It is almost amusing to see how far the official or semi-official organs of the Austrian and Russian Foreign Offices went in the expression of their keen feelings of uneasiness and indignation at the respective manifestations in the Peninsula of a spirit of revolt against foreign tutelage. Neither the organs of Count Kálnoky nor those of M. de Giers refrained from uttering words of wrath and menace. In the former, Servia was treated almost like a vassal state of its Austro-Hungarian neighbor, which had no right to have a policy of its own, and the *Journal de Saint-Pétersbourg* not only spoke of new trials to which Bulgaria was exposed by Prince Alexander's facing about, but did not hesitate to say that "the Russian Generals had obtained the authorization of the Emperor to tender their resignations"—as if the Czar were the legal sovereign or suzerain of the Bulgarian Principality. As things stand, both Prince Alexander and King Milan may be reckoned as opponents of Russia's policy in the Peninsula, but their peoples, the late change in Bulgaria notwithstanding, both gravitate in the Russian direction.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, October 10, to TUESDAY, October 16, 1883, inclusive.]

DOMESTIC.

A DECISION was rendered by the Supreme Court of the United States on Monday in five civil-rights cases, based on the first and second sections of the Civil-Rights Act of March 1, 1875. They are respectively prosecutions under the act for not admitting certain colored persons to equal accommodations and privileges in inns and hotels, in railroad cars and in theatres. The Court holds that Congress had no constitutional authority to pass the sections in question under either the Thirteenth or Fourteenth Amendment of the Constitution. The decision, however, is held to apply only to the validity of the law in the States, and not in the Territories or the District of Columbia, where the legislative power of Congress is unlimited. Justice Harlan dissented.

Full returns from the Ohio election give a Democratic majority in the State, for Governor, of about 12,000. The Legislature is Democratic on a joint ballot by about 25 votes. The Prohibition party vote in the State is estimated at from 15,000 to 20,000, and the Greenback at 2,000. The total vote was 711,681, and the vote for the prohibition amendment to the Constitution 320,454 This gives a majority against prohibition of 70,793. These figures, while not official, are nearly correct.

In Iowa the Republican plurality is about 30,000, with 57 majority in the Legislature.

In Virginia the Readjusters are much discouraged over the Republican defeat in Ohio, which they think will make it more difficult for Mahone to carry the State.

The Greenbackers of Massachusetts who have no particular faith in Governor Butler, and who hold themselves aloof from the older wing of the party, met in convention at Worcester on Tuesday to nominate a State ticket. John F. Arnold was nominated for Governor.

A consultation of leading Democrats of this State, including many editors, was held in Albany on Friday to consider the interests of the State ticket. A serenade was given to Governor Cleveland in the evening. He made a speech which was more partisan than any of his public utterances. At noon on Saturday the Republican candidates for State officers held a conference in Albany. The State of the canvass was considered and Republican success was predicted.

The Citizens' Committee of Fifty held an important meeting in this city on Friday afternoon. It was decided, on the recommendation of the Executive Council, to take an active interest in the campaign, and to make nominations for all the city and county offices. The Executive Council reported that at the most about $45,000 would be sufficient for a most thorough canvass. On Tuesday two nominations were made for Supreme Court Judgeships, and two for Justices of the City Court. Other nominations will be made.

The Rev. S. Parsons, of Summit, has been nominated by the New Jersey Prohibitionists for Governor. He says that he will stump the State until election day.

The Secretary of the Treasury on Saturday issued a call for $15,000,000 of 3 per cent. bonds.

Secretary Folger, after long consideration, has decided the noted Hesing whiskey compromise case by accepting without modification the offer made by Hesing.

The report of the Commissioner of Pensions, which has just been forwarded to the Secretary of the Interior, is a most complete and exhaustive review of the pension system. It will show that the number of pensions on the rolls increased from 280,000 on July 1, 1882, to 303,000 on July 1, 1883. Of the applications on file 148,000 are for arrears of pensions; the rest, about 100,000, are for current pensions only, applications having been filed since July 1, 1880. Of the claims for arrearages it is estimated that about 60 per cent. will be allowed. The average amount paid to each claimant for arrears, when the system of examination by one physician only was in vogue, was $1,900. Now that the plan of boards of examiners has been very generally established, the average is reduced to $1,400.

The resignation of Commissioner of Patents Marble has been accepted, and the place has been offered to Mr. Ben. Butterworth, of Ohio, who has accepted it.

Surgeon-General Charles H. Crane died at his residence in Washington on Wednesday morning, at the age of fifty-eight. He entered the army as an assistant surgeon in February, 1848. On July 3, 1882, he was promoted to the rank of Surgeon-General.

In view of the retirement of General Sherman from active duty on November 1, and the succession of Lieutenant-General Sheridan to the command of the armies, the following changes will take place: The Department of the South has been consolidated with the Department of the East, with General Hancock in command, headquarters at New York. General Schofield will take command of the Division of the Missouri, with headquarters at Chicago; and General Pope will succeed the last-named in command of the Pacific Division at San Francisco. Brigadier General Augur will succeed Major-General Pope in command of the Missouri Department, with headquarters at Fort Leavenworth. Brig.-Gen. R. S. Mackenzie will succeed General Augur in command of the Department of Texas.

The first three months of the term of service of the United States Civil-Service Commissioners expired on Monday. In that period twelve clerks have been appointed under the rules in the War Department, six in the Treasury, and two in the Post-office.

A loophole has been discovered in the Chinese immigration law by which Chinese have been permitted to land at San Francisco. The second article of the treaty permits any Chinaman other than a laborer to come to the United States if he be provided with a certificate issued by the Chinese Government identifying him as being engaged in other pursuits than that of a laborer. The steamer *Rio Janeiro*, which arrived at San Francisco on Saturday, brought 132 Chinamen for San Francisco, 77 of whom held tradesmen's certificates, issued by the officials of the Chinese Government. Notwithstanding the strongest external evidence of their being ignorant Chinese laborers, all but six were permitted to land. The Custom-house officers say that they have no power to go back of the Chinese Government's certificate.

Governor Eli Murray, of Utah, has made an alarming report to the Secretary of the Interior on the condition of affairs in that Territory with reference to the Mormon problem. He recommends "that it be made lawful for soldiers of the United States to be used for the execution of processes out of the courts of the United States, in the hands of the United States Marshal of Utah." As a remedy for the many evils complained of, he asks that if the Legislature elected under the Edmunds bill fail to repeal all laws passed by former Legislatures respecting the establishment of religion, and all statutes by which laws of Congress have been nullified, or to pass laws forbidding polygamy, and punishing all persons who solemnize plural marriages, and providing for neglected and deserving wives, and to recognize the sovereign authority of the United States, then that Congress shall repeal that section of the organic act establishing such a body, and assume control in the government of the Territory.

At the annual meeting of the Board of Trustees of the John F. Slater Fund in this city on Tuesday, it was reported that the income of the fund for the current year is about $60,000, from which an appropriation of $20,000 has already been made, and the sum of $16,250 has been allotted to twelve institutions in seven of the Southern States. All these institutions have undertaken to provide industrial training. Other appropriations will soon be made to the extent of the available means of the fund.

The will of the late Henry Farnam, of New Haven, gives the homestead in Hillhouse Avenue, upon the death of the widow and his son, Prof. Henry W. Farnam, to Yale College in trust, with a request that it be tenanted by the President or one or more of the professors to be designated by the President. Included in this bequest are lots adjoining the homestead. The value of the bequest is about $200,000.

The Bankers' Convention met at Louisville, Ky., on Wednesday, and was opened by an address by President George S. Coe. On Thursday it adopted a resolution in favor of a national bankruptcy law, and also one in favor of the coinage of only so many silver dollars as the business of the country requires. L. J. Gage, of Chicago, was elected President, Mr. Coe declining a reëlection.

The Congregational Council has been in session at Concord, N. H., during the week. The Secretary's report showed a net gain of 262 churches during the past three years, and of 5,079 in membership. The addition to churches by profession averaged 12,500 annually. The contributions for Sabbath-schools last year amounted to $300,000, and for charitable objects to more than $6,000,000.

The General Railway-Time Convention in Chicago on Thursday voted to adopt on November 18 a uniform standard-time schedule. There will be four standards for the entire country, differing by exactly one hour each.

An extensive strike of switchmen for higher wages began in St. Louis on Monday.

President Green's annual report of the Western Union Telegraph Company shows that they have 432,726 miles of wire and 12,917 offices; 40,581,177 messages were handled during the year, the receipts from which were $19,454,902 08, against $17,114,165 92 last year. The expenses for the year just closed were $11,794,553 40, leaving a net profit of $7,660,349 58, an increase of 8 per cent. over the preceding year. A Board of Directors for the new year was elected on Wednesday. There were only two changes from the old Board.

The long-pending negotiations between the Globe Telephone Company, of New York, and the Shaw Telephone Company, of Chicago, have been completed, and the Globe Company now becomes the owner of the patents for the United States formerly owned by the Shaw Company.

The taking of testimony in the Sessions bribery trial began on Wednesday afternoon at Albany, with ex-Assemblyman Bradley, who narrated the incidents of the alleged attempt of Mr. Sessions to bribe him. Mr. Bradley admitted that when he took the money, promising to vote for Depew, he did not mean to do so. His cross examination was continued on Thursday. After the testimony for the prosecution had been heard, a motion to quash the indictment was made. The Justice denied the motion on Saturday, and the testimony for the defence began.

A brilliant reception was given Lord Chief-Justice Coleridge of England at the Academy of Music, in this city, on Thursday evening, under the auspices of the State Bar Association. Elliott F. Shepard, Chief Judge William C. Ruger, and William M. Evarts made addresses. Lord Coleridge made a graceful and thoughtful response.

The Rev. Dr. Ewer, of St. Ignatius Church, in this city, died in Montreal on Wednesday morning.

A severe earthquake shock was felt at San Francisco on Wednesday morning.

FOREIGN.

The prospect of an easy settlement of the difficulty between France and Spain was disturbed on Wednesday by the impression prevailing in Madrid that France was not disposed to go further in the way of an apology for the insult to King Alfonso. It was reported that the Spanish Minister of Foreign Affairs had recommended that the Ambassador to France be recalled unless further reparation were granted. The other ministers opposed this step as extreme. The Foreign Minister then threatened to resign. On Wednesday evening it was known positively in Madrid that France had refused further satisfaction. Prime Minister Sagasta then considered that the moment had arrived to leave to a new Ministry the task of adopting final measures in the affair. King Alfonso accepted the resignation of Sagasta's Ministry, as they were unable to agree what course to pursue. He thereupon asked Señor Sagasta to form a new Ministry, but as the Dynastic Left did not show any disposition to come to terms with the latter, he was obliged to decline the task, and advised that it be intrusted to Señor Posada-Herrera, who, he said, would perhaps be able to effect a union of the different groups of the Liberal party. Señor Sagasta promised to support a Cabinet formed on that basis. King Alfonso then summoned Señor Posada-Herrera, who undertook the task.

The new Premier has long been prominent in Spanish politics. In 1877 he was elected President of the Chamber of Deputies. He belongs to the Progressist Moderate party, and is sixty-eight years of age. Alfonso granted the new Premier power to dissolve the Chamber of Deputies, which makes him more independent than previous Premiers. Señor Camacho declined to continue as Minister of Finance in the new Cabinet, as he was reluctant to trust his projects for financial reforms to a coalition Cabinet. On Friday the Duc de Fernan-Nuñez, the Spanish Ambassador to France, resigned, and declared his determination to insist upon the acceptance of his resignation. In the evening, at an interview between Señor Posada-Herrera, Señor Moret, and Marshal Serrano, Señor Moret explained to Señor Posada-Herrera the conditions upon which the Dynastic Left would enter the Cabinet. A full Cabinet was announced on Saturday, with Señor Posada-Herrera as Premier, Señor Gallostra as Minister of Finance, Señor Moret as Minister of the Interior, General Lopez-Dominguez as Minister of War.

It was also announced from Madrid on Saturday that the friendly assurances and cordial explanations tendered by Prime Minister Ferry had satisfied the Government. The Alfonso incident was therefore considered at an end, and the Spanish Government, with the assent of France, announced that such was the case in a circular to its representatives in other courts. The new Cabinet has been sworn. It is considered doubtful whether a majority of the members of the Cortes will unconditionally support the Cabinet, especially in its policy on the questions of universal suffrage and constitutional reform. Señor Moret's organ asserts that the aspirations of the Left will receive satisfaction in the programme of the new Ministry.

Señor Moret, the new Spanish Minister of the Interior, has requested the officers in his department not to resign, as is the usual course in a change of Ministry. He explains that the present Government seeks the co-operation and good will of all the factions of Liberalism, in order to correct abuses and to prove to the nation that the Liberals can form a compact party, and will not wreck, by divisions in their ranks, the splendid opportunity afforded by the reconciliation of the monarchy with the democracy. Gen. Lopez-Dominguez, Minister of War, does not propose to displace any generals of the army, but if any tender their resignations they will be replaced by friends of Marshal Serrano.

In Madrid on Friday evening the anniversary of the discovery of America was celebrated with a splendid banquet and a number of speeches in the opera-house.

At the French Ministry of Marine the claims of Mr. Shaw, the English missionary who was involved in the Madagascan trouble, are considered settled. He will receive an indemnity of 60,000 francs, and the French Minister of Foreign Affairs will address to the British Foreign Office a diplomatic letter regretting the occurrence.

Prime Minister Ferry, of France, in a speech delivered at Havre on Monday, foreshadowed the withdrawal by France of the present embargo upon the importation of American bacon.

The revised estimates of the French budget show a deficit of 55,000,000 francs, which M. Tirard, Minister of Finance, proposes to cover by a reduction of governmental expenses.

The French Cabinet has adopted the proposal of Admiral Peyron, Minister of Marine and of the Colonies, to create a Superior Council for the colonies, to be composed of thirty-six members. A French Radical manifesto, signed by three members of the Senate and seven members of the Chamber of Deputies, including M. Clémenceau, M. Laisant, and Tony Revillon, has been published, urging the formation of permanent electoral committees throughout the country, to register all citizens desiring the organization of the republic by the vote of a Democratic constitution.

The Governor of Cochin China reports that he has completed an agreement with the King of Cambodia by which the latter will introduce for the future government of his kingdom a new Constitution. The agreement confirms the establishment of a French protectorate, provides liberal institutions for the people, establishes measures for the security of property, reorganizes the administrative and judicial systems, and entirely abolishes slavery.

The report that the French defeated the Chinese at Bac-ninh is unconfirmed. Lin Yang Fu, commander of the Black Flags in Tonquin, has issued a challenge to the French troops to come forth from Hanoi to battle. It was reported in Hong Kong on Thursday that the Black Flags had quarrelled with their allies, the Chinese regulars, in the provinces of Yunnan and Kwangsi. The Yellow Flags have disbanded, the majority joining the enemy because the French interfered with their commander. It was also reported that a Chinese Admiral with four gunboats had left Pakhoi for Lung-mun, near the Tonquin frontier, to embark most of the Chinese troops there. The Admiral will return to Canton soon with General Fang. It is supposed that the intention of massing Chinese troops on the Tonquin frontier has been abandoned.

A riot has occurred at Foochoo, China, owing to the French Consul's having objected to the burial in ground adjoining the foreign concession of a Chinaman who had died from cholera. The temper of the Chinese at all the treaty ports is dangerous.

O'Donnell, the slayer of Carey, the informer, has daily interviews with his solicitor. He complains of the severity of prison discipline. Three hundred pounds have, so far, been spent in his defence by bringing witnesses from the Cape of Good Hope. The police have failed to find any evidence showing connection between O'Donnell and the Irish Invincibles. On Monday the Recorder of the Central Criminal Court, in London, charged the Grand Jury in O'Donnell's case. He said that it would be the sworn duty of the jury to return a true bill for murder. The indictment will not be returned until Wednesday next.

At the regular fortnightly meeting of the Irish National League in Dublin on Wednesday evening it was announced that £1,000 had been received from Australia by the treasurer during the week, and also £1,000 from America.

A rumor was circulated on Wednesday that Sir Stafford Northcote had been shot and dangerously wounded in a small Irish town. The rumor proved to be unfounded.

The British Liberal Conference began its sessions at Leeds, England, on Tuesday. Mr. John Morley presided. The programme of the subjects to be considered includes the extension of the franchise, reform of the government of London and of the counties, equalization of the county and borough franchise, woman suffrage, a redistribution of seats in Parliament, and an improved registration of voters and of the methods of voting.

The Lower House of the Hungarian Diet on Wednesday, by a vote of 187 to 105, passed the resolution of Herr von Tisza, the Hungarian Prime Minister, for the settlement of the escutcheon question in Croatia. It provides that the present Croatian inscriptions be retained, and that the Hungarian and bilingual inscriptions be discontinued. This reform was carried into effect at Agram on Tuesday.

The Czar and Czarina of Russia ended their visit to Copenhagen on Thursday, and started for St. Petersburg.

During the services in a Jewish synagogue at Zivonka, in the Government of Podolia, Russia, on Saturday, a false alarm of fire was raised in the women's gallery, which caused a panic. There was a terrible crush, during which forty women were killed and thirty others injured.

The Danish polar steamer *Dijmphna* arrived on Wednesday off the island of Vardöe, Norway. She got clear of the ice on August 2, but afterward lost her propeller and became ice-bound again in the Straits of Kara until September 26, when she was released.

Four hundred persons are prostrated by trichinosis in ten villages of Saxony.

The Khedive of Egypt has issued a decree granting amnesty to all persons implicated in the late rebellion except those convicted of murder and outrage.

Doctor Koch, of the German Commission which went to Egypt to investigate the cholera epidemic, reports that he has discovered that cholera is due to a living, thread-like microscopic organism resembling that seen in cases of phthisis.

Sir John Macdonald, Premier of Canada, was on Thursday convicted of bribery through agents in the Lennox Parliamentary district. It was proved that many votes were purchased in his interest.

A Durban despatch on Tuesday announced that the remnant of King Cetewayo's party, having assembled with the intention of rescuing Cetewayo from Inkankla Bush, where he had been in hiding, Chief Usibepu, whose forces had been watching the borders of the Reserve, near Babanango, South Africa, surprised them and slaughtered one-half their number. Cetewayo has surrendered to the British Resident. He will be conveyed to Natal.

A despatch from Vladivostok to St. Petersburg announces that the steamer *Kamtchatka* arrived there on Wednesday. She reports that eleven trading schooners, whose nationality is unknown, after driving off the American guardship *Leon*, belonging to the Alaska Commercial Company, stationed at the island of Tjulenij, landed sixty armed men, including some Japanese, and took possession of the island.

THE END OF THE CIVIL-RIGHTS BILL.

The calm with which the country receives the news that the leading sections of the celebrated Civil-Rights Act of 1875 have been pronounced unconstitutional by the Supreme Court, shows how completely the extravagant expectations as well as the fierce passions of the war have died out. The Act was forced through Congress as the crowning measure of the plan of reconstructing the South on which the Republican party entered at the close of the war, and under the influence of that feeling of omnipotence with regard to the South which was the natural and unavoidable result of the prolonged exercise of the war power, and which survived the war for fully fifteen years. Some of the ablest lawyers in both houses saw its unconstitutionality clearly enough, and pointed it out; but some voted for it as a useful piece of party work, which might do good and could not possibly do any harm. What the Act directed the hotel-keepers and railroad managers and theatrical managers to do in the treatment of colored people was good in itself, and if they did it, all would be well; if they did not do it, the colored people would be no worse off than they were before the Act was passed, and the Republican party would still have the credit of doing its best to put them on a footing of complete social as well as political equality. It was as clear then as it is now to almost every candid-minded man, that the Fourteenth Amendment, on which the promoters of the Act professed to base it, was really directed against State legislation, and not against the acts of individuals. This was about as plain as words could make it, but the legal argument had little or no weight against the argument drawn from party advantage.

The reason why the Fourteenth Amendment had not given Congress power to legislate directly in defence of the social rights of the negroes in the several States was plain enough, too. It was that the Republican party, when the amendment was adopted in 1868, was occupied solely with the defence of the ordinary civil rights of the freedmen against hostile or reactionary State legislation. It was, in short, due to the fear that slavery might be succeeded, for the colored people, by a carefully prepared condition of legal inferiority, and against this the men who abolished slavery determined to guard. An amendment providing for the admission of negroes to hotels and theatres and public conveyances would not have been adopted, because the notion that the social equality of the colored people could be hastened by legislation sprang up later, when they had come more distinctly into view as citizens and property-holders, theatre-goers and travellers; but it never was strong enough to procure either the adoption of a Constitutional amendment or the passage of an act which anybody expected to be enforced. The Civil-Rights Act was really rather an admonition, or statement of moral obligation, than a legal command. Probably nine-tenths of those who voted for it knew very well that whenever it came before the Supreme Court it would be torn to pieces.

Any one who has forgotten, or is not old enough to remember, the arguments which were made to do duty in the service of the bill when it was before Congress, will find an interesting summary of them in the comments of Mr. Greener, the colored lawyer, on the late decision of the Court, in the *Evening Post* of Tuesday. As a reminiscence of ways of thinking about constitutional questions which have almost wholly passed away, they are interesting reading. It will be seen that there is very little flavor even of legality about them. They are almost all based on moral considerations with which courts of law under our system have little or nothing to do. The decision is wrong because it is likely to annoy and inconvenience the colored race. It is wrong because it disregards, in disobedience to the Constitution, certain primeval natural rights brought over here by the first settlers; because it may lead to Catholic bishops or Jewish rabbis being expelled from railroad cars; because it raises inconvenient questions of social equality; and because, coming just after the Ohio election, "it can scarcely be construed as anything else than a covert and insidious blow at the institutions of the Republican party."

What the Court has decided, we need hardly say, is simply that the Fourteenth Amendment does not authorize Congress to protect the civil rights of colored people within the States against anything but hostile State legislation; or, in other words, that the powers of Congress are defined by the Constitution, and not by considerations of humanity, or even general utility, or by the opinions or wishes of prominent politicians. Consequently, nearly all that the arguments originally produced in support of the Act, as well as those of Mr. Greener now against the Court's interpretation of it, really prove is, that the division of powers made by the Constitution between the States and the Union is not a proper one, and that the framers might have made a far better Government than the one they did make, if they had only tried.

SOME SUGGESTIONS OF THE OHIO ELECTION.

The Republican defeat in Ohio is an unpleasant fact, both because of the encouragement it will give the Democrats throughout the country, and because it has clearly been due in a large measure to an agency which is not likely to prove merely temporary or transient —we mean the temperance question. It has been plain enough, ever since the South dropped out of politics, that the Republican party would have to husband carefully such resources as it had apart from the slavery question and the war. Foremost among these was the passion of a very large proportion of its members for what are called "moral issues." The nucleus of the party has, in fact, from the beginning consisted of men who are never satisfied in politics unless they think they are doing what is right, as well as what is expedient. Since the party ceased to meddle in Southern affairs, no provision has been made in party management for this portion of it, in which so much of its strength lies. The civil-service reform movement in some degree, at least in the Eastern States, touched their imagination, and a proper mode of dealing with it might have done much to strengthen their declining allegiance. But the persistence of the managers in flouting and deriding it, down to the elections of last fall, had the unfortunate effect of convincing large numbers — even those who cared little about civil-service reform, but liked to take a serious view of public affairs—that the party was thoroughly controlled by triflers and jobbers. The conversion which has since occurred, however useful to the country, has unfortunately had too much the air of deathbed repentance to do the party much good. In other words, its hold on its most earnest section, to which it undoubtedly owed its prolonged possession of the Government, has been seriously weakened, without any better compensation that one can see than "two per cent. on the annual compensation" of a few office-holders.

The growth of the temperance movement in the West, and its increased and increasing force as a disturbing agency in politics, are in all probability the result of these longings for moral issues, for which many Republicans have been unable to find satisfaction within the party ranks. Strong drink is undoubtedly a fearful scourge all over the West, in even a greater degree than at the East. The towns swarm with saloons, which are a constant snare and temptation to every passer-by. There are probably very few households containing young men which are not made more or less unhappy by it, through the apprehensions of the women about husbands and sons; and there are few callings which are not thickly strewn with the wrecks it has caused. The liquor agitation has been for many years, as one might expect, trying to force its way into party politics, and has often in "off years" done the Republicans, to whom it furnishes some of their most earnest supporters, considerable damage. Hitherto, however, it has not been able to make itself felt in years when defeat was likely to prove a serious discouragement. This time, in the year before the Presidential election, it has proved strong enough to "smash things," in complete apparent indifference to consequences. It has gone so far in Ohio as to put the real party of liquor in power, simply to punish the Republicans, and has tried to saddle the State with a prohibitory amendment to the Constitution, the execution of which would undoubtedly have been attended with great difficulty and confusion. In Iowa, also, the Republicans have triumphed by a large majority, under an obligation to pass a most stringent prohibitory law, the temperance question there, apparently, dominating all others.

The proposed amendment in Ohio forbade "the manufacture of and traffic in intoxicating liquors to be used as a beverage," and directed the Legislature to provide for the enforcement of the prohibition. What this would mean in practice may be inferred from the fact that there are in the State 221 distilling, brewing, or wine-making establishments, with a capital of $13,739,230, and producing annually about $16,000,000 worth of drink-

ables more or less intoxicating, or about one-twentieth of the total manufactures of the State. In this is not included the value of the stock of liquors on hand, in the distilleries, breweries, and saloons and taverns, because these would presumably not be destroyed by the amendment, but might be sent out of the State for sale elsewhere. But the loss to the dealers over and above their stock and fixtures, by the mere destruction of "the good-will" of their business, would certainly exceed $5,000,000 annually. This undoubtedly made the amendment seem a very serious matter commercially, and possibly involved a legal point which, if it has never been raised, probably will be before long, and that is the right of the State to destroy suddenly a large mass of private property without compensation.

The effect of prohibition as an irritant would have varied according to the class of the population which it reached. As a general rule, native Americans can bear having their liquor cut off with perfect calm. Few except the very rich drink anything intoxicating with their meals, differing in this in a marked degree from every other people in the world. One of the large hotels in London, we believe, now refuses accommodation to Americans, because they drink no wine at dinner, or, as English landlords express it, take nothing "for the good of the house." All foreigners, too, are surprised by the absence of bottles and decanters from the American tables d'hôte, and are puzzled by the equanimity with which what is called "the average American" washes down his food with plain ice-water. It is true that there is an enormous amount of solitary as well as social drinking at bars; but this, if a pleasure at all, is a pleasure so brief and evanescent that none but confirmed topers would be much put out if every bar in the country were closed.

The Germans and other foreigners take a very different view of the matter. To them wine or beer with their meals seems an absolute necessity. Food without claret is to a Frenchman a cruel mockery, and so is food without beer to most Germans. There are about 394,000 foreigners in Ohio, and upon the half of these, who are probably Germans, the prohibitory blow would fall with crushing severity, for they not only take beer with their meals, but they use it as an aid to social intercourse, and as in fact an inseparable accompaniment of all their amusements. Moreover, like all the nations of Continental Europe, they have never yet understood the temperance movement. Interference on the part of the State with a man's food or drink seems to them a blow at the very foundations of personal liberty, submission to which on the part of the two great liberty-loving communities of the world—England and America—is to them perfectly incomprehensible.

The future of the liquor interest in this country must be considered greatly clouded by what has happened in Ohio and Iowa, and there could hardly be a worse time than the present for any party to propose, as Mr. Randall has done on behalf of the Democratic party, that the tariff should be saved by making whiskey free. Moreover, as far as one can see at present, we have probably witnessed the entrance into the political arena of a new organization, with which both parties will hereafter have to count, but from which the Republican party is likely to suffer most, and which is permeated by much of the iconoclastic spirit which first made the Republican party a power. One of the great advantages the Republican party enjoyed in the beginning was that it made politics interesting and even exciting to the women. One of the greatest disadvantages under which the Democratic party has labored for the last quarter of a century, at least at the North, has been, not simply that it had nothing to attract the young men, but nothing to touch in the smallest degree the female imagination. An ardent female Democrat is something which probably nobody has seen at the North for twenty-five years, while enthusiastic female Republicans have abounded in every village. It looks now as if the Republicans were likely to suffer from having nothing in their programme which can be called interesting family reading, or which gives voters the character of defenders of a sacred cause in the eyes of their own household. It is more than ever doubtful whether any party in this country can hereafter long retain power without it.

PROHIBITORY GIFT DUTIES.

Mr. George Jacob Holyoake attempted, on his recent visit to this country, to bring with him some presents for distribution here, and, like all foreigners who have made that experiment, he lived to regret it. He has published an account of his struggles, which, in spite of its unfriendly allusions to our beloved protective system, is amusing reading. His first trouble was with a photograph of John Bright, which he brought over as a present for a Chicago friend. He found that he could get it through the Custom-house only on payment of $6, and was naturally somewhat astonished by that fact. He recalls the graceful invitation sent a short time ago through Mr. Evarts to Mr. Bright to visit America, and remarks that under the statutes there is no provision whereby Mr. Bright's portrait can be admitted "unless the importer pays a penalty at the Custom-house for his temerity in making the offer of it."

Mr. Holyoake's greatest trouble was with a bale of books which he had consented to distribute for the Mayor of Brighton. The Mayor is very much interested in sanitary science, and had caused to be published, in a handsome volume, the proceedings of the first Congress of Health held in England. He wished to present a hundred or more of these books, together with some documents of scientific interest relating to Brighton, and likely to be of interest to the coast cities of the United States, to such American cities as would like to have them. Mr. Holyoake found that he could only get the books through the Custom-house by paying $100, or by writing to the authorities of the cities to which he intended to make his gifts, and getting from each a letter testifying its willingness to accept. As to get such letters would have entailed a loss of much time, and an expense of roomrent and clerk-hire amounting to at least $500, Mr. Holyoake informed the customs officers that the books might as well be treated as the tea was in Boston Harbor. They advised him to go to Washington and consult the authorities, which he did. While there he learned that consignments of goods addressed to the Smithsonian Institute were permitted to come in free of duty, and having obtained the consent of Professor Baird to have his books distributed through the Institute, he finally got them to their destinations. He is evidently in no mood to attempt further benevolent acts of this kind. "Protection," he says, "is a good thing, I am aware, and many people need to be protected from evils known and unknown; but I was surprised to find that an intelligent country like America thought it necessary to be protected from information acquired at much cost by others, and unobtainable in that form by themselves." On being shown the clause of the law which forbids the free admission of more than two copies in one invoice of any book, map, or chart intended as a gift to a school, institution, etc., he came to the conclusion that "nothing save a minor present could be made to America, and that only by an intrepid and wealthy donor prepared to take infinite trouble to make his gift."

Mr. Holyoake is not the first foreigner who has had trouble of this kind. Mr. Richard A. Proctor wrote a letter to the London *Times* a few months ago, complaining that some "little gifts, intrinsically worth less than cost of carriage, and not including a single dutiable article," which he sent from London to friends in Missouri at Christmas time, "were kept at New York till enormous customs charges were paid." He concluded his complaint with this vigorous passage: "Consigned to St. Joseph, Mo., 1,500 miles from New York on one side, by people in England 3,000 miles away from New York on the other side, they lie there the prey of the great nation which has the eagle for its national emblem, but, judged by its customs, might much more appropriately take the raven." Of course, expressions of this kind are open to the criticism that they are of British origin, and are possibly uttered by emissaries of the Cobden Club who have been sent over here to work secretly in the interest of free trade by casting ridicule upon the protective system.

Occasionally, however, complaints are heard on this side. A short time ago an irate American wrote to the *Tribune* a moving description of the experience he had had in receiving a present which had been sent to him from Italy. The donor had sent him word that the present was coming, saying it consisted of a couple of terracotta figures, the original cost of which was only $1. When the package arrived he was presented with a bill of $6 for duty, freight, commission, and several other things. As he must either pay the bill or put himself in the position of declining his friend's present, he paid the charge, and on opening the package found the figures so broken as to be valueless. The Government officials knew they were broken when they made the charge, but concealed the fact until the bill was paid. When the receiver demanded reparation he was referred to the steamship company which had transported the package, and when he applied to the company he was told he must go

to the packer who had put up the goods in Italy, for the breakage was clearly due to his imperfect work. In another instance a gentleman in this city received a Christmas present of a bronze flower-dish from a friend in Germany. To get it out of the Custom-house cost him $10, and when it was taken from the box one of the side handles was found to be broken off, making the gift practically worthless. These are only specimen instances in hundreds which happen every year. A present from abroad is really a financial misfortune from which every American has reason to pray that he may be delivered, but he has no especial excuse for complaining. He pays enormous taxes on nearly everything he wears and upon most of the things he uses, and it merely completes the symmetry of our tariff system to make him pay for his presents also.

THE REPUBLIC AND THE COALITION.

PARIS, September 27, 1883.

THE journeys of sovereigns have had this year a peculiar significance: they have obviously tended to extend the sphere of influence of the German and Austrian alliance. This alliance, concluded a few years ago by Prince Bismarck, and since renewed for a longer period, has become the corner-stone of European politics. It is very different from the so-called alliance of the three Emperors which followed the war of 1870, as it is not only concluded for the preservation of peace, but also for the attainment of certain specific objects. The conversations which Prince Bismarck had at different times with foreign ministers and ambassadors on the characters and ultimate objects of the alliance, are well known in political circles. Prince Bismarck has well explained how, even on the day after Sadowa, he became anxious to spare Austria and to reserve for her a new rôle. He found great difficulties in this attempt at first, but as soon as the wounds of Austria began to heal, as soon as it became possible for him to play on the old antagonism of Russian and Austrian interests in the valley of the Danube and in the peninsula of the Balkans, he did not lose his opportunity. His journey to Vienna was the triumph of his politics. He showed the Austrian Emperor what was the "manifest destiny" of his *Oesterreich*—how Austria was the natural heir of Turkey in the East; how she seemed created in order to bring by degrees under her influence the numerous principalities which shook off the hated sovereignty of the Sultan, and to make, with the help of the Eastern populations themselves, a formidable barrier against the ambition of Russia. There are old mosaics in which the Emperor is represented on his throne, surrounded by Italia, Allemania, Austria. What is Allemania? It is modern Germany—Prussia with all her confederates. What is Austria? It is the actual Empire of the Hapsburgs; and this empire must find new confederates in Rumania, in Servia, in Bulgaria.

The King of Rumania is a Hohenzollern, a German, a man of considerable intellect. He has exchanged his title of Prince for the title of King, and, though his government is a constitutional monarchy, with two Chambers and responsible Ministers, there is no doubt that his influence is very great, especially with regard to foreign affairs. The position of Rumania is a singular one. Rumania has been looked upon by Russia as a sort of advanced position, a *tête de pont*. Before the last Eastern war, Rumania was obliged to sign a secret convention, in which she gave to the Russian armies the right of passage across her territory as soon as war should have been declared with Turkey. When hostilities began, the Rumanian army became a part of the Russian army, and at Plevna the courage of the Rumanian regiments was much admired. How is it that so soon after these great events Rumania is now drawn toward Austria and depending upon the protection of the traditional enemy of Russia? It is almost needless to explain. When Russia stopped before the gates of Constantinople, she gave a proof of impotence and of incoherence which will not be forgotten for years to come. Nihilism achieved what a mistaken diplomacy had begun. The huge Russian empire appeared suddenly as a colossus with feet of clay; it is a stupendous mass, in a sort of atomic or molecular state, without any nerves, any nervous centres, any organization. Opinion always runs from one extreme to another. The strength of Russia was overestimated; now it is probably underestimated. It is said that when Prince Bismarck was still in diplomacy, whenever he left a court he had a seal made with an inscription which condensed his opinion of the country and the people he was leaving. When he left St. Petersburg, he ordered this simple word to be engraved on a seal, "Nichts." Public opinion has been recently drawn to the same conclusion; and it is curious to notice the casual coincidence of this word "Nichts" and Nihilism.

If there was anywhere a prince who owed everything to Russia, it was Prince Milano, who has also recently expanded into a King Milano, but he too has forgotten the old services of his protectors, and has tried to become a *persona grata* at Vienna. Bulgaria is the creature of Russia. We all remember how the last war began with the "Bulgarian atrocities." Russia, while she stipulated hardly anything for herself, assured the independence of Bulgaria, and Europe found a sovereign for the new principality in the person of Prince Alexander of Battenberg. We hear now that he likewise wishes to show his independence, and to take a place in the pleiad of Balkan principalities which are to form a sort of vanguard of Austria. It was easy to foresee that the dismemberment of Turkey would end in the formation of small states which would oscillate between Russia and Austria. The pendulum is now on the Austrian side. Austria herself has taken possession of Bosnia and Herzegovina; she is looking on Adrianople, and she is drawn, almost perforce, toward the Ægean Sea. Turkey can no longer stop the movement of disintegration which is taking place. She is bankrupt; almost all her taxes are in the hands of European receivers. The Mohammedans will gradually give way before the Christians.

The Austro-German alliance has not only been fortified by the gradual attraction of the principalities of the Balkans and of the Valley of the Danube—Italy has been allowed to join it. The King of Italy does not exactly go *pari passu* with the two Emperors, but Italy has bound herself to them by a regular treaty; all the eventualities of the future have been examined, and a common course of action has been adopted. The King of Italy has become Colonel of an Austrian regiment, and is called the Austrian Colonel in the radical papers of Rome. The policy of Italy has been determined by the Tunisian war and the semi-annexation of Tunis to French Algeria. A French professor has lately published a book under the title 'L'Italie qu'on ne voit pas,'* in which he makes citations from the geographical text-books used in the Italian schools. The Italian boys are taught that the natural boundaries of Italy take in Savoy and Nice, and even Corsica. The Irredentists do not speak much at present of the Trentino, or of Trieste; Italy is looking in other directions, and she has joined the fortunes of the Powers whom she thinks the strongest and the most capable of doing something for their friends. The *rapprochement* of the Italian policy and the Austro-German policy has not produced a great political crisis in Italy: the Left is still in power; but the Conservatives have gained in influence, and their voice is again becoming heard. The Italians are wonderfully flexible; they understood at once that a sort of monarchical solidarity required a more conservative policy at home.

What is exactly the character of this monarchical solidarity? It is not yet to be compared to the famous Holy Alliance formerly made against Bonaparte and the principles of the French Revolution; but the monarchs of Europe seem to draw nearer together—they put themselves on the defensive. They dare not attack by deeds, nor even by words, the new French Republic; but it seems as if this Republic, placed in the midst of Europe, made them a little uneasy. France will always have an extraordinary power, which will extend far beyond her frontiers: her stage, her novels, her fashions, her sociability, the attractions which she presents to the foreigner—everything contributes to make France (and France in one sense is Paris) a focus which radiates in all directions. It was the policy of Germany to favor the establishment of the Republic in France. Without being too Machiavellian, Prince Bismarck probably thought that a French Republic could not be a dangerous Power; but there are many ways of being dangerous. He expected, perhaps, to see the French democracy using up its strength in vain and endless divisions, but even he did not understand the terrible force of centralization. All the machinery of the state, which extends even to the smallest village, works quietly and irresistibly for the Republic, just as it did for the Second Empire. Cabinets may change, the administrations continue their work. The Republic may have its Mexican expeditions, may throw great classes of the population into a state of despair, may persecute the congregations, may remove six hundred judges from the bench, may dilapidate the resources of the country; on goes the old engine of centralization, and everything is as quiet as if the country was living under an absolute ruler. Not a peasant thinks of transgressing the military laws, or of refusing his taxes. Nothing can stop the great current; the country is obedient, quiet, peaceful, but ready for all the sacrifices of war, if these sacrifices be asked. This is not the kind of republic which Europe expected. Very few statesmen, even among the most experienced, really understood the forces which universal suffrage creates, and which create a power all the more irresistible that it is (so to speak) anonymous. The sovereigns, led by a sort of instinct of preservation, begin to see, even better than their ministers, that the continuation of a republic which, with all its mistakes and faults, is prosperous, and does not attack the foundations of property, must become in the end a sort of *reductio ad absurdum* of the monarchical system.

We see the young King of Spain now joining the charmed circle of the Kings and Emperors. A short time ago a military pronunciamiento was made in Spain, directed against the monarchical form of government, and republican in its tendency. The young King had already promised to go to Berlin and to witness the great manœuvres of the German army. He left his own country before the mystery of the pronuncia-

* See the *Nation*, No. 930.

miento had been well explained, and paid his visit to the Emperor of Germany. He comes back as colonel of a regiment of Uhlans garrisoned in Strassburg. It has always been the fashion in the German, Russian, and English Courts to interchange colonelcies of regiments. The Kings of the two Sicilies and the Dukes of Parma and Modena accepted colonelcies from Austria at the time when Italy was under the Austrian régime. But Alfonso II. is the first King of Spain who has consented to become colonel in a foreign army. No French Prince under the Bourbons or the Orléans was ever allowed to command, nominally, foreign troops. The acceptation by Alfonso of Spain of the colonelcy of Uhlans has given great offence in Paris, and the Radicals threaten to make a demonstration at the entrance of the young King into Paris or during his short stay in the French capital. Nothing could be more unfortunate, for any offence against the King of Spain, on a futile pretext, would only tend to change the monarchical *rapprochement* into a real coalition.

I have shown the various forces which seem to be slowly uniting. It remains to be seen, first, if there are not counter-forces which are beginning to come into action, and, secondly, what is the real *objectif*, as military men are accustomed to say, of the monarchical union. Who is the enemy in view? Is it France? Is it Russia? Or is the union directed against both France and Russia? This problem deserves a close examination.

FROM LONDON TO AMSTERDAM.—II.

PARIS, September 6, 1883

IN the summer at all events the ride from Ghent to Antwerp is of the dustiest and most disagreeable. The few historic places on the way do not count at all. But Antwerp once in view, one's spirits rise. This indeed is really the only way to approach the fine Flemish capital. From the other side of the Scheldt only does one get a just view of the city, the matchless spire of its cathedral rising high above its neighborhood of picturesque roofs across the broad river, which with its multifarious craft has so often been painted by Clays, and which makes the approach from the Ghent side seem not a little like New York seen from a ferryboat leaving the Weehawken dock. Only with us there is no spire which, *pace* Mr. Upjohn's admirers, Charles V. would have wished encased in glass, or Napoleon compared to Mechlin lace; and, admitting Mr. Quartley as a satisfactory substitute for Clays, the country with us does not—in so far as man has had to do with it—lie so ready-made to the painter's hand. The Antwerp spire is the last thing of Belgium one sees in passing through to Holland; on a second visit at least, of all Belgian things it leaves the most durable impression on the mental retina when once the border is crossed and one feels that he has left the entire category to which it belongs for good and all behind him. And, on a second visit, one misses this deplorably, and one's sensations are in consequence very nearly doleful.

Could an obtuse traveller's ingratitude go further? any one may demand who chooses, and I shall not complain. But it is to be remembered that Holland is *par excellence* the country of first impressions. In that respect it is like everything unique—like Venice, for example. Nowhere else, not even in Venice, does one experience the delight of mere novelty more keenly than on entering Holland for the first time. The landscape is astonishing, no matter how many descriptions one may have read of its wide, incredible flatness, dotted with scores and even hundreds of wind-mills; with sleek black and white cattle and shaggy horses; with long, low white houses, half-hidden in clumps of bushy light-green trees; large sloops and schooners mysteriously wafted to and fro on invisible canals; the immense expanse of sky full of infinite cloud variety, shadows sweeping quickly across the foreground, rain falling in one corner, square miles of yellow grain swaying in the distance, the very essence of light and air everywhere—in a word, the concrete inspiration of Ruisdael and Van Goyen. Everything is intensely characteristic The lack of compromise in this respect—that is, the absence of even the hint of what elsewhere constitutes "scenery," in England, in Italy, in Switzerland, in Catalonia, in Provence—is so positive and complete as to be singularly stimulant and refreshing. One can understand the rise and excellence of the Dutch landscape school: its excellence when its rivals were Claude and Salvator Rosa, and its superiority at the present day, with a competition indigenous to the Rhine valley and "Saxon Switzerland" on the one hand, and the succession to Corot and Rousseau, now wholly given over to the literal, on the other. The "values" of the landscape are so subtle, its elements so few and simple, and its "effects" so delicate, so clear, and so unconventional, that the painter of it has but to copy well to succeed; the qualities of skill and fidelity here take the place of the imagination elsewhere and serve as well.

Could one praise a country more highly? But one feels all this in its acuteness only once, and, as I said, Holland revisited does not at all produce the same effect. There was a reason after all, one reflects, for the unpatriotic self expatriation of Both and Berghem and Swanevelt. They did not succeed too well, to be sure: European galleries in fact are strewn with their "Italian" failures. But undoubtedly they felt, in their indigenous landscape, the same lack that is felt by the returning traveller whose enthusiasm has had time to cool, and who dejectedly realizes that of all countries it is especially true of Holland that it can be seen once only for the first time. It is as fresh, as clear, as green and gray as ever, the vessels are sailing down through the fields, the horizon is as low as before, and there are the same 180 degrees of marvellous clouds; but one no sooner crosses the Hollandsch Diep than he wonders how it is that now for the first time he appreciates the distinct and definitive lack of *charm*. It is all picturesque enough, if you will, but picturesque by paradox, picturesque because it is unfamiliar, unexampled, novel, unique; because there are no conventional standards of measurement and admiration in the negative result of involuntary contrast. At length all that clear and fresh green and gray becomes almost defiantly prim and prosaic. *This* time you perceive that you were mistaken a twelvemonth ago in preferring good prose to even mediocre poetry; and that the latter has at least a superior atmosphere, an atmosphere more or less impregnated with charm.

The prosaic note is everywhere. Belgium is a flat enough country north of Antwerp, and it may seem to the inexperienced as if the transition could hardly be noticeable. But aside from the visible fact that every feature which the two countries possess in common is rapidly accentuated as one moves northward, the way in which a people impresses its characteristics upon even general landscape physiognomy is nowhere better illustrated than on either side of this boundary. The difference between the Flemish and Dutch temperaments will hardly be gainsaid, certainly since the war of separation. In two hours one exchanges a Catholic country for a Protestant, and the difference is immense. For the direct fostering influence which the Catholic church has had on the fine arts there is, to my notion, less than nothing to be said. But it is hardly disputable that indirectly it has been almost a condition of their existence in the modern world. Charging itself exclusively with the consciences of its members, and arranging for these the grand affair of conduct which has absorbed so much Protestant mental activity since the time of Huss, it has indubitably left untrammelled to expand to their utmost the natural energies of its devotees. Can anything more dismal be imagined than the interior of a Dutch church—for example, the Nieuwe Kerk at Amsterdam, justly termed by the guide-book "one of the finest churches in Holland"? Amsterdam itself bears the appellation of "Venice of the North," and it would be ridiculous to assert that it is not an interesting city: it is thoroughly imbued with a kind of prim picturesqueness, full of novelty and features exclusively characteristic, full, too, of that most interesting of all civic characteristics, a varied, actual, modern life, of which indeed Venice, at last feeling the pulsations of united Italy, is only beginning to manifest the signs after its long chrysalis existence as a subject for Mr. Ruskin's threnodies and a museum for his peregrinating pupils. In fact, to a reflecting observer—that is, to the modern observer, the observer to whom the most ethereal flights of fine art appeal in virtue of their illustration of the human mind and spirit instead of as sentimental ministrations to the fancy—the contrast between Venice and Amsterdam in this respect has many points in favor of the northern capital; and a city one-fourth of whose inhabitants are paupers does not in many ways *look* as well (to say nothing of total impression) as one where more or less equally distributed prosperity reigns. Here also, however, one's liking for the Dutch quality is born of contrast rather than positive: and in fifty years (or more, or less), when the new steamers on the Grand Canal are twice as numerous and twice as well stocked with passengers; when the Giardini Pubblichi become a real instead of a nominal resort, and the Lido as popular as Coney Island; when the Riva gives tokens of a visibly profitable commerce, and every steamer between the city and the Giudecca does not hail from Southampton or Trieste; when the crumbling Gothic monuments shall have been definitively restored, and a score of Tintorettos and Titians rescued from the oblivion of damp crypts and gloomy tawdry altars, it will be only with an ironical intention if Amsterdam is still called the "Venice of the North." For this trim, characteristic, and prosperous city has an enormous point of difference from Venice as it is: it lacks charm, and no one needs to be told that Venice is saturated with charm, that it is charm quite as much as being built on piles that renders her unique.

At Amsterdam there is not even taste. It is curious that with us the recently popular architecture, based exclusively on taste and defiant of both the Gothic principle of decorative construction and the Classic theory of felicitous proportions with decorative detail, should have taken Amsterdam as its model; for I suppose Mr. Norman Shaw himself would admit the Dutch origin of his so-called "Queen Anne." A city built of black brick with white or pale yellow (generally wood) "trimmings" illustrates "taste" chiefly from the undertaker's point of view. The inevitable gables provided with block and tackle, for the excellent reason that in a city built on made land the attic must take the place of the cellar as a storehouse (is it not singular that this gable should have become the main feature of "Queen Anne" architecture in a "dry land"?), have a cumulative effect that is the very antithesis of taste. If there is a bit of

stained glass or a church fresco in all Holland, it is not in Amsterdam; there are instead tall clocks and so-called "picturesque," that is, whimsical, domestic furniture. The "Dam" is a fine square, and the Kalverstraat an interesting thoroughfare, but the buildings on the one, notably the Palace, are the last word in clumsiness, and the shop-windows on the other are eloquent of the national genius for the heavy and the awkward; one would not find such shoes in Sixth Avenue, such cutlery in the Bowery, such *articles de vertu* in the Piazza di San Marco, such "insincere" as well as ineffective workmanship in Naples. Yet I have heard the Kalverstraat compared to the Palais Royal. That great attraction, too, of Latin cities (whence the very word urbanity), whose want is supplied in Germany by good nature and in Belgium by geniality—I mean a general and evident amenity—is conspicuous by its absence. Amsterdam is remarkable for the number and excellent management of its charitable institutions, and perhaps this is why there is no overflow, no unorganized surplus of human feeling wasted in the general movement of life in the cafés and along the sidewalks. If you desire to be directed any whither, a casual informant takes the utmost pains to set you right; you are well enough served in the restaurants; officials everywhere discharge their functions in your regard with minute fidelity; but you must have no vague demands to make on the people in general: your needs must be concrete and definitely expressed. You must have no sentimentality to be wounded if fat burghers and dames in metal and lace headdresses crowd you off the little sidewalks, almost upset you in a rush for the tramways, step on your feet when once within, stare at and talk about you at the same time. I remember being forced into the gutter of the Kalverstraat, in company with a lady with whom I was walking, by a couple of officers, one of whom turned, in answer to my look of meek protest, and raised his hat with a curious expression which said plainly, "Ah, yes, you are strangers; you are not used to our ways; you seem to expect street amenity. I am an officer; I ought to have indulged you." And his uniform! The Dutch women's headdresses are pleasing—any survival of old costume jostling the monotony of modern attire is pleasing; but the spectacle obtained by the conjunction of Dutch physiognomy with Dutch taste, civil or military, in the detail of official dress, is grotesque. Fancy a convention of New England deacons dressed as the military contingent in a burlesque.

What gives Amsterdam its paramount and permanent interest is, however, not the fact that it is "the Venice of the North," but its collections of Dutch pictures. There are fine Rembrandts everywhere from Vienna to Madrid; there are lovely De Hooghes in London and Paris; Paul Potter's "Bull" is at the Hague; Franz Hals is at his best in Haarlem; Hobbema is as good in London, and Van der Helst in Florence and New York, where he is at any rate not fatiguing; but nowhere is the Dutch school in its entirety presented so splendidly as Amsterdam presents it in the Rijks Museum, the Museum Van der Hoop, and the collection of Heer Six in the Heerengracht. Every one knows that "The Night Watch" and "The Syndics" and the Six portraits are at Amsterdam, and I am not going to abuse the reader's patience by prating of Rembrandt, nor even to yield to the temptation to confute the many sceptics who maintain that in mellowing the general tone he begged the question of flesh-painting, by insisting a little on that miracle of moist pink and white blondeness, the portrait of Anna Six. The visitor ought to be reminded, however, that to neglect the splendid collection of the master's etchings which is to be seen for the asking at the Rijks Museum, is to lose not only a pleasure, but what is necessary for a complete induction in Rembrandt's case. And I should like to call his particular attention to the perfection to which that most interesting and sympathetic of Rembrandt's followers, Nicholas Maes, brought the expression of his single theme, and to a marvellous figure piece by Van der Meer, of Delft, in the Six collection, which for beauty and grace adjoined to perfect reality might be taken as an epitome of the best that Dutch *genre* affords. As to the De Hooghes in the Van der Hoop Museum, one will only be at a loss to determine his preferences among the four—to decide which one he would exchange for that one in the London National Gallery which has an open-air vista, in order to have the four finest De Hooghes in the world.

Little professional as Fromentin was, and universal as in general his perceptions are, I wish that he had been less a painter in speaking of Pieter De Hooghe, so that he might not have failed to distinguish him from Metzu and Terburg, who have in common with the former nothing but the identity of a superb technic, and no spiritual relationship whatever. Did any one ever mistake an interior by De Hooghe for one by Terburg or Metzu, or indeed by any painter but himself? His rivals have the same technical *cachet*, if you choose, though the difference in personal force makes itself felt even here, but this difference is the main thing, and it is immense; it is the difference between Raphael and Fra Bartolommeo, between Claude and Turner, between—to make a fanciful digression—Reims and Cologne. There is no term for it more definite than spiritual distinction, but that is a quality which however vague is very palpable, and—as one could have said before Ruskin's abuse of the epithet—very precious. What is it but this that endues with such serene charm the little out-of-doors scene in the Van der Hoop Museum? Its elements are those of the simplest *bourgeois* idyl: a low red-brick house with white wooden pilasters and bright red-tiled roof; to the left is a fence, across the top of which inclines a bushy little tree, in whose shade on the hither side sit and stand a group of three persons sipping some drink or other; nearer the house and to the right a sturdy woman bends over a barrel, and beyond, still further to the right, is a fence with an open door disclosing a vista of trees and distance tempered light. The sky is as rich as Dupré would have his, and the color would be resplendent but for the mellow tone arrived at by that observance of "values" which so delights Fromentin; every detail tranquilly transpires "after noon." Contrast with this fusion of poetry and science, of delicate sentiment and consummate skill, the most ambitious of Mr. Alma-Tadema's compositions, or even the most successful effort of Mr. Tadema's master, the late Baron Leys!

But we can cool our enthusiasm equally well by a visit to the International Exposition, which also can very well wait another letter.

W. C. B.

Correspondence.

THE "RESOLUTIONS OF '98."

To the Editor of The Nation:

Sir: In your review of Mr. George Ticknor Curtis's 'Life of James Buchanan,' as contained in No. 952 of the *Nation*, it is said that "the Kentucky resolutions of 1798 had become the favorite form of expression among all the Southern extremists, because their phraseology was the most explicit and clear as to the alleged constitutional right of secession." And the phrase cited as being explicit and clear to this effect is the clause they contain affirming that, in cases of alleged violation of the Constitution, the several States are "*the judges, not only of the infractions, but of the mode and measure of redress.*" The reviewer expresses the opinion that "no subtilty of sophism has ever been able to rid these words of the whole sweeping doctrine of the disunionists, that, they themselves being the judges of cause, necessity, and policy of secession, the States had each and all the constitutional right to leave the Union when they pleased, and that, once having acted, they were as independent of the Union as if they had never joined it."

The reviewer discriminates clearly enough between the original meaning of these resolutions, as conceived by their authors and supporters at the time of their adoption, and the subsequent construction put upon them by the latter-day disunionists; but I think his language leaves the impression on the mind of the reader that these resolutions do really contain, and were meant to contain, "the whole sweeping doctrine of the disunionists." As my studies in the political history of 1798 have led me to believe that it is only by "the subtilty of sophism" that "the whole sweeping doctrine of the disunionists" was ever deduced from either the Kentucky or the Virginia resolutions of that date, I crave permission to give my reasons for holding this opinion.

Every body knows that the so-called Kentucky and Virginia "resolutions of '98" originated in a plan of political agitation concerted by the Republican leaders of that day for the purpose of creating a public opinion against the alien and sedition laws. Mr. Jefferson has explained to us that these politicians, finding themselves "browbeaten by a bold and overwhelming majority" of the Federalists in Congress, determined "to retire from that field and take a stand in the State Legislatures" (see Jefferson's 'Complete Works,' vol. vii., p. 229).

Pursuant to this plan, Jefferson wrote a series of resolutions defining the position of the Republicans as to those two laws in particular, and as to the principles of constitutional limitation in general. He sent a copy to Mr. Madison, for purposes of mutual advice and consultation, and another copy to Colonel George Nicholas, with a view to their introduction by him into the Legislature of Kentucky. As Colonel Nicholas was not a member of the Kentucky Legislature at that time, he handed the series to Mr. John Breckinridge, by whom the resolutions were submitted to that body. They were passed through both houses with only a few dissenting votes, but not until they had undergone very important modifications, as can be seen by comparing them with the original draft of Mr. Jefferson (Jefferson's 'Works,' vol. ix., p. 464). And by comparing a letter of Mr. Jefferson's to Mr. Madison, under date of November 17, 1798, with another letter on the same subject to Mr. Wilson C. Nicholas, under date of September 5, 1799, the reader will understand the reason why the language of Mr. Jefferson's first draft was toned down in the passage of the resolutions through the Kentucky Legislature (Jefferson's 'Works,' vol. iv., p. 258, and p. 305).

The Virginia resolutions of 1798 were penned by Mr. Madison in Room No. 9, as a well-authenticated tradition asserts, of the old Swan Tavern of Richmond, the "Republican headquarters" of that city. But as Mr. Madison was not a member of the Virginia Legislature of that year, he handed the series to John Taylor, of Caroline County, by whom they were carried through the House of Delegates after a spirited debate, of which we still have the record.

The Federalists of that day, both in Virginia and elsewhere, contended that this whole mode of attack on the two statutes in question was misdirected, and that, in its tendency, it was disorganizing and seditious so far as it impugned the constitutionality of a Federal law in the name of a State; that laws of Congress obnoxious to public censure could be properly and constitutionally opposed in only one or all of the three following ways: (1) by petition for their repeal; (2) by resort to the Federal courts for redress; or (3) by popular initiative in each Congressional district or State, looking to the election of Federal legislators disposed to vote for the repeal of the statutes in question.

The Republicans maintained, on the other hand, that while these three remedies were entirely right and proper as far as they went, they did not exhaust the modes and measures of redress which were otherwise open to the people under the Constitution; that besides them it was competent for a State Legislature (1) to pass resolutions solemnly remonstrating against laws believed to involve an infraction of the Constitution; (2) to instruct its Senators and request its Representatives in Congress to vote for the repeal of such laws; (3) to invite its sister States to coöperate in these efforts to arrest unconstitutional proceedings; (4) to interpose for the arrest of dangerous infractions by inviting its sister States to join in the call for a national convention to revise the Constitution in parts where it had been broken or was found to be weak; and (5) to interpose for the arrest of dangerous infractions by communicating with its sister States in the hope of inducing two-thirds of all the Representatives of the States in Congress to propose amendments which should meet the exigencies of a given situation.

To recapitulate: The Federalists suggested three modes and measures of redress. The Republicans specified five other modes and measures of redress, cutting deeper into the heart of a complication without running the knife outside of the Constitution, and two of these modes looking to that radical measure of redress which requires the joint action of three-fourths of the States, which are certainly "parties to the compact" whenever new constitutional engagements are formed. I have merely summarized these eight modes from the debates of the Federalists and Republicans on the passage of these resolutions through the Virginia House of Delegates.

Having thus got the historical bearings of this question, we are now in a position to understand what the Kentucky resolutions of '98 import on their face, and what they were meant to import when they say that each State, considered as an integral party to the Constitution, has an equal right with all its sister States "*to judge for itself, as well of infractions as of the mode and measure of redress*" which will suffice to meet the demands of a given emergency. It can take its choice among eight modes, all equally within the Constitution; and that the "redress" contemplated by the Kentucky resolutions of '98, whether considered in its "mode" or its "measure," was to be pursued "*in a constitutional manner*" is expressly affirmed by the kindred resolution of '99, when the protest of the preceding year was reiterated in still more trenchant language.

And we are now in a position to understand what this resolution of '99 imports when it says that "*a nullification by those sovereignties* [the States] *of all unauthorized acts done under color of that instrument* [the Constitution] *is the rightful remedy.*" All idea of force or of revolution or of disunion must here be eliminated from the meaning of the word "nullification"; for no other "nullification" is admissible under the express terms of the resolution than such as can be effected "in a constitutional manner." Those who recall how swiftly the case of Chisholm *v.* Georgia, because of the alarm which it spread among the States, led to the adoption of the Eleventh Amendment to the Constitution, will see at least one way in which dangerous principles, even when they have passed the final ordeal of the Supreme Court, can still be "nullified" in a constitutional manner. The South Carolina politicians afterward gave a bad name to the word "nullification," but they first purloined the word and then debased it. On this point I need but cite Mr. Madison's well known letter to Mr. Everett, written in the year 1830.

And we are now, too, in a position to understand what Mr. Madison meant when he wrote, in the Virginia resolutions of '98, that "in case of a deliberate, palpable, and dangerous exercise of other powers, not granted by the compact [the Constitution], the States who are parties thereto have the right, and are in duty bound, *to interpose for arresting the progress of the evil, and for maintaining within their respective limits the authorities, rights, and liberties appertaining to them.*" They are to "interpose" in such a "mode" and in such a "measure" as shall meet the requirements of each crisis, extending even to a reconstruction of the Constitution, should it be necessary. But nothing extra-constitutional and nothing outside of the Union was here intended if Mr. Madison understood the purport of his own language.

And finally we are now in a position to understand how it was that these same Republican leaders of '98 and '99 did but act in simple consistency with their professed principles when they stigmatized secession as "treason." This they did on a notable occasion in the same old Swan Tavern in which the resolutions of '98 had been penned, and only ten years after those resolutions had been promulgated. The occasion was a public banquet then and there given to the Electoral College of Virginia, to celebrate the elevation of Mr. Madison to the Presidency. It was in the month of December, 1808, when the disunion agitation of that day, growing out of opposition to the Embargo Act, was at its height in New England, and was so rife as well as so notorious that a prominent Federalist of Maryland, Mr. A. C. Hanson, could write even two years afterward to Timothy Pickering, of Massachusetts, that in his opinion "if the question was barely *stirred* in New England, some of the States would drop off from the Union like fruit *rotten ripe.*" (See Henry Adams, 'New England Federalism,' p. 382.) As the Electoral College was then in session in Richmond, and as the leading dignitaries of the Republican party were then assembled to celebrate the renewed triumph of their principles, they seized the opportunity to put themselves on record against the new-fangled doctrine of "secession." The quadrennial banquet of the Electoral College was not a merely casual and festive entertainment in Virginia—it was a Virginia "institution" down to the year 1860, the favorite time and place for enunciating political policies and opinions before the country, especially during the continuous period of twenty-four years when the President of the United States was a Virginian. And so on the 8th of December, 1808, among the "regular toasts" provided for the political demonstration of that year, we find the following: "*The Union of the States: the majority must govern: it is treason to secede.*" (See Richmond *Enquirer*, December 10, 1808.) Among the men who drank to that sentiment were the members of the Electoral College, the Madison Corresponding Committee, who had conducted the canvass, the Governor of the State, the President of the State Senate, and many other distinguished Virginians—all stanch supporters of the "resolutions of '98." I find it difficult to conceive that these gentlemen could have drunk to that toast with a decent respect for themselves or for the opinion of their countrymen if they had supposed that those resolutions, whether of the Kentucky or Virginia Legislature, lent any color of pretext to the pernicious dogma of "secession." Whatever else may be said of these men, it has not been common to hold them as merry Andrews and fools, but it is not easy to defend their repute for sobriety and common sense if they committed themselves consciously or unconsciously to the doctrine of secession in 1798, and then ten years afterward denounced it as "treason."

I find, on recurring to the contemporaneous political literature of that day, that the Republicans of Kentucky, equally with the Republicans of Virginia, protested that their resolutions were mere expressions of opinion, designed to be accompanied with no other effect than such as they might produce by exciting reflection and leading to corresponding constitutional action. And while the opponents of the resolutions deprecated them as being of *evil tendency*, because they might possibly lead to the disobedience of the laws in question before they had been repealed, it was nowhere charged by anybody, so far as I can discover, that the resolutions contained, either implicitly or explicitly, the dogmas of "secession" and "nullification," as afterward attempted to be read between their lines by a new race of Southern politicians.

JAMES C. WELLING.

WASHINGTON, October 5, 1883.

[Our correspondent takes no issue with us upon the points actually made in the review, which bore solely upon the doctrines of the disunionists of the Calhoun school, under whose lead the great rebellion occurred. The question, What was the intention of the original framers of the resolutions of '98? is a quite distinct one; but while it was not within the scope of our discussion of the political career of Buchanan, we still think the considerations urged by Mr. Welling do not free the Kentucky resolutions from the meaning which the later disunionists gave them.

The action of the Virginia politicians does not affect the question materially, for the distinction between the two sets of resolutions was notorious. The influence of Madison had kept out of those of Virginia the explicit and trenchant radicalism of those of Kentucky. Yet even then some things must not be forgotten. Taylor, of Caroline County, who introduced the resolutions, had in the same year brought forward a proposition looking to the secession of Virginia and North Carolina, and the formation of a separate confederacy by them. Jefferson's original propositions were such that Madison could not accept them, and greatly modified them in the form introduced by Taylor. The action at the Swan Tavern in 1808, when the embargo was straining the attachment of New England to the Union, only proves how easy it has always been for politicians to change front when their devices have "returned to plague the inventor." Massachusetts, Vermont, New Hampshire, Connecticut, Rhode Island, Delaware, and New York, by action of their Legislatures, all denounced the secessionism of the resolutions of '98, interpreting them in the same sense in which they were understood in 1860.

In the original draft of the Kentucky reso-

lutions, to which our correspondent refers, was one which was in substance the nullification resolution of 1799. It "resolved" that when the general Government assumes powers "which have not been delegated, a nullification of the act is the rightful remedy; that every State has a natural right, in cases not within the compact (*casus non fœderis*) to *nullify of their own authority* all assumptions of powers by others within their limits." There is no real dispute that prudence alone suppressed this resolution in the Kentucky series of 1798, and the following year it was passed, making the whole complete again. The resolution of 1799 was the reply of the anti-Federalists to the indignation which their former resolutions had excited. The distinguished author of the resolutions had acquiesced in temporizing so far as immediate action was concerned. His letter to Madison of November 17, 1798 (Jefferson's 'Works' iv., p. 25), had said: "I enclose you a draft of the Kentucky resolutions. I think we shall distinctly affirm all the principles they contain, so as to hold to that ground in future, and leave the matter in such a train as that we may not be committed absolutely to push the matter to extremities, and yet may be free to push as far as events will render prudent."

If, as Mr. Welling argues, the only intent of the resolutions had been to agitate on lines wholly within the Constitution, the resolutions took a strange way of expressing it. There had been no dispute about the right to do every one of the five things which he enumerates. The real question was quite beyond these: Could a State, regarded as a separate sovereignty, an original party to a compact, nullify that agreement, or laws passed by the Federal Government under it, *without* securing repeal either through Congressional action or Constitutional amendment? The resolutions are utterly empty of meaning if they did not refer to this. Their own language is the most conclusive reply to Mr. Welling's argument. Let us read again the text of the one which we did not take space to quote in full in our review. It said: "Whenever the general Government assumes undelegated powers, its acts are *unauthoritative, void, and of no force;* that to this compact [the Constitution] each State acceded as a State, and is an integral party; that this Government, created by this compact, was not made the exclusive or final judge of the extent of the powers delegated to itself, since that would have made its discretion, and not the Constitution, the measure of its powers; but that, *as in all other cases of compact among parties having no common judge*, each party has an equal right to judge for itself, as well of infractions as of the mode and measure of redress."—Ed. Nation.]

THEORETICAL ENGLISH.

To the Editor of The Nation:

Sir: In your article on "Theoretical English" (October 11) are one or two references to the reluctance of Germans to accept any help whatever in their English studies from Americans. They prefer to dispense with all assistance, but ours seems to them nearly worthless. Now, their belief that Englishmen know the language better than we do is natural: most of us would rather study German in Hanover than in Pennsylvania. But the belief is a good deal stronger than it would be had our English cousins not taken such extraordinary measures to strengthen it. I lately brought from England a small dictionary, German and English, given me by a German friend long resident there. It was published in Germany in 1861, and is based upon a larger work, both being evidently of English origin. Notice is given that "Americanisms" are italicized, and since a very few of the italicized words and phrases are marked as vulgarisms, the student's inference must be that the rest pass in America for good English. Under the letter "A," in the English-German part, I find *absquatulate, all-fired, amost, argufy* (which it appears that even we know to be a vulgarism), *ary* (for "either"), *awfully* (in the sense of "extraordinarily"), and many others. Elsewhere a brief inspection supplies me with such specimens of "theoretical American" as *flusteration, to flunkify* (to alarm), *nimshi* (an awkward fellow), *plaguy, savagerous, yourn*, etc., etc.

It is unnecessary to say that only two or three of these words are recognized by American lexicographers, even as vulgarisms, and quite as many are as much English as they are American. Of course the work in question gives as Americanisms some which are really such—forms originating here without necessity, or in violation of English analogy, and used by some respectable writers. Many more, however, are words or meanings which we have been compelled to coin in order to represent new objects or ideas. These are our legitimate contribution to the common stock, and are fast becoming everywhere current. Out of seventy-three examples of Yankee-English, however, taken from this small dictionary twenty-four are not to be found in Webster's great one, fifteen are traceable to England, and only nine are recognized by Webster as peculiar to this country. On the last point, indeed, an American can hardly be the final authority; but, if he cannot be good authority about the language in general, then so much the worse for large numbers of Englishmen. On the shelves of the small library, less than forty miles from London, in which I made most of the above-mentioned discoveries about my native *patois*, stood an English edition of Webster's "Unabridged," while on the drawing-room table lay an English pocket edition of Worcester.

I cannot close a letter complaining of a grievance without saying that I brought home, along with this exasperating volume, a heightened admiration for England, and the most grateful and affectionate recollections of Englishmen. A.

ENDOWMENT FOR BIOLOGICAL RESEARCH.

To the Editor of The Nation:

Sir: In your number for this week you notice Professor Lankester's address on the endowment of biological research. His lamentations over the want of pecuniary assistance to science in England are certainly only too well-founded, but his statements and comparisons have a still more emphatic lesson for Americans to learn, because America does far less for biology than England. If, then, England needs $10,000,000 for the adequate endowment of biology alone, how much more pressing is the necessity for an equal sum for the same purpose in the United States, with twice the population of England. Counting physiology, anatomy, pathology, botany, and zoölogy each separately, I cannot make out a list of quite a dozen American biological institutes of active research, and on that list appears the Johns Hopkins laboratory of physiology as the only one which can be said to be both adequately organized and endowed. We must, therefore, look to the future, and turn our hopes not toward the central Government, but toward private munificence. The prosperity of biology in America depends upon the liberality of our wealthy citizens; we cannot appeal to the national treasury as Professor Lankester asks for English public funds, for such an appeal is contrary to all our traditions.

It would be possible now to found an institution for the prosecution of biological research which would be invaluable to the progress of science. With an income of thirty or forty thousand dollars an institute could be carried on which would contribute more to the increase of biological knowledge than is now contributed by all the institutions of the country collectively, excepting *perhaps* the national organizations. This may seem an exaggeration, but mature deliberation has convinced me that this assertion is far within the bounds of a reasonable estimate, provided that the money be spent in salaries for a corps of workers hired solely to investigate, and in the purchase of apparatus and materials for research, and that no money is required to be spent in building or in maintaining a museum. Each worker would then perform his allotted work, employing his highest faculties; no ability would be wasted or overtaxed; the career of discovery would be assured, because there are immense fields of possible knowledge which may be mastered by intelligence and perseverance. The *great* discoveries cannot be promised, because there is no guarantee for genius. Such an institution would in a few years confer vast benefits on mankind and bring honor to the country. It is an ideal which I have thus hinted at; should the plan ever be actually executed, it still would be ideal. All must hope to see American science develop until it may be compared with European science without any longer awakening our shame. I share with others the faith that the time is not far distant when this will be accomplished. Biologist.

October 13, 1883.

CONCERNING PUBLIC DOCUMENTS.

To the Editor of The Nation:

Sir: In England, I understand, the question is still asked, Who reads an American book? In this country, the query is put, in somewhat similar spirit, Who reads a pub. doc.? This is a pertinent and suggestive inquiry.

Unlike any other publisher, the Government looks for no returns in the book business. It is not obliged to take the merchantable quality of its publications into consideration. The issues of the public press are not in the open market until they reach the second-hand bookstores by the usual devious channels. The typical public document is an official "report," of a purely perfunctory character, which may or may not possess any public interest. It is usually prepared in the routine of a public desk to satisfy the ordinary requirements of official machinery. The question whether these requirements could be as well fulfilled by the manuscript report without printing it, is seldom answered, or even asked. Its publication being provided for by law, it is accordingly published, and the final cause of its existence is accomplished when it issues from the public press. A requisition has been properly filled, some tons of books have been duly delivered, and "that job is done."

All except being paid for. The money, of course, comes out of the appropriation, and the contracting officials settle their accounts in due form, finally closing the whole transaction according to law. But the appropriation for printing is drawn from the public funds, and

this is but another name for the people's money. It is the people who pay for the publication at last, and they have to pay for it whether they want it or not. At this stage of the proceedings the Government has placed itself in the position of a publisher who has got up a book by involuntary subscription, and which he may, if he chooses, deliver to some of his subscribers by a method of his own devising, commonly known as the "distribution of public documents." It is true that he sells out his stock at cost; but that is his affair; and everybody knows plenty of books that nobody would have, at cost or at any other price.

The Government has manufactured many a ton of books which it has sold to its subscribers at its own price, and which its subscribers have forthwith sold for what they could get in the paper-mill market—the contents of the same being a profound mystery outside the circle of the faithful and laborious Government proof-readers. It is the old story of the button and the button-hole. The Government button-hole, in books as in many other fabrics, possesses the quality of elasticity to such magical degree that every Government button fits it exactly. Here is the button-hole, in the shape of a certain requisition for printing; and here is the button, in the shape of the required report, which must fit, for it has been "ordered by Congress" to do so. Some buttons, however, are so constituted that they obstinately refuse to fit any imaginable button hole, giving rise to the natural question, What is the use of sewing them on?

It is the buttons of this kind which have so often made misfits of the literary garments of the Government that the public document has been brought into very general disesteem. The vast majority of the books which have issued from the public press are absolutely unknown to the people at large, who have paid for them. "Their names are never heard"; and, on the whole, it is perhaps best that they should await in peace the fate which reduces them to the pulp from which they came. Bearing the Government imprint are also many more books, unfortunately better known, whose names are never mentioned but with derision—books which furnish the never-failing occasion for staple cheap jokes about their whole furnishing, from the nature of their contents up to the quality of the paste with which the covers are stuck on. But these are likewise bought and paid for by the people.

It is not pretended that many publications of no obvious public utility are not both necessary and proper cogs in the machinery of government, nor that the proper authorities in each department are not necessarily the judges of what is required in a given case. If, for instance, they want to issue what are virtually nothing but advertisements, it may be sound business policy to do so, as long as the appropriation holds out. But it should never be forgotten whose money is being spent.—Very truly yours,

ELLIOTT COUES.

WASHINGTON, Oct. 6, 1883.

Notes.

PROFESSOR BAIRD'S Smithsonian Report for 1881 has just been printed. In addition to the report proper, this volume serves the function of a scientific annual in its summary reviews, by various experts, of the year's progress in astronomy, chemistry, botany, meteorology, physics, zoölogy, and anthropology; while the appendix is still further enriched with miscellaneous papers on the last-mentioned topic (American aboriginal, wholly), and by a history of the Smithsonian exchanges.

'A Sylvan City' (Fords, Howard & Hulbert) consists of fifteen papers, of a magazine lightness, all relating to Philadelphia, and all derived from *Our Continent*, in which they originally appeared. Some of them, perhaps many (six are from one hand), were written by those not to the manner born, and the defects of superficiality are superadded. However, for popular reading too much must not be exacted, and these sketches of Penn, of Franklin, of Girard, of the early churches, the libraries, the post-office, the old houses, the hospitals and medical schools, etc., have a readability and a connection which justify the experiment of binding them up together. The illustrations were certainly worth repeating.

After the publication in October of his 'Old-World Idylls,' which, as we have already announced, is substantially identical with the American edition of 'Vignettes in Rhyme,' Mr. Austin Dobson will begin to collect his later poems, to be published some time next year under the alluring title, 'At the Sign of the Lyre.'

A new edition of 'Plato's Best Thoughts, compiled from Professor Jowett's Translation,' by Professor Bulkley, of Howard University (Charles Scribner's Sons), gives proof of two facts: first, of the popularity of Professor Jowett's translation, and, secondly, of the continually increasing interest in the writings of Plato, to which we lately called attention in our note on Professor Campbell's edition of the 'Theætetus.' The present volume contains about one-fifth of Plato's works. The extracts are arranged alphabetically according to subjects, commencing with "Ability and strength, difference between," and ending with "Zeal, right or wrong." Quite frequently an extract seems to us to be placed under an unsuitable head; but this defect, if it exists, is almost entirely remedied by the great abundance of cross-references. With the aid of these the reader can hardly fail to get a good idea of the best that Plato has said upon almost every subject mentioned. Books of "extracts" and "beauties" are necessarily fragmentary, and in most cases unsatisfactory and tiresome. Professor Bulkley has on the whole done his work with judgment and taste, and his compilation will prove interesting to most persons whose thoughts sometimes rise above dollars and dimes. What the classical scholar will perhaps miss most is the ineffable grace with which Plato, in the opening passages of his dialogues, introduces the interlocutors to the reader, and the skill and vividness with which he pictures the external circumstances which led to the discussion. In the dialogues of Plato more than anywhere else one gets a clear idea of the manners of cultured and refined Athenian gentlemen in their intercourse with each other. However, no one can read a few pages of this book without afterward turning over their contents in his mind; and this in itself is a great good.

It is seldom that we feel called upon to express unqualified approbation of a text-book for schools; but Mr. Robert P. Keep's edition of 'The Iliad of Homer, Books I.–VI.' (Boston: John Allyn) leaves so little room for fault-finding that we shall not attempt any. Facing the title-page is a beautiful facsimile of a page of the Codex Venetus A (13x10 inches), the most important MS. of the 'Iliad.' The introduction gives a very good summary of the results of the investigations of modern scholars as to the origin and mode of transmission of the Homeric poems; and, though necessarily brief, it will yet inform the student of what many quite recent text-books of the 'Iliad' do not, that there is such a thing as "the Homeric question," and impart some idea of its nature and the different answers which have been given to it. The sections on the structure and scansion of Homeric verse, on the dialect of Homer, and the commentary generally show a nice appreciation of what a student needs and ought to have. Altogether, the book is very handsome and very scholarly, and we have no doubt will prove very useful. Its material, make-up, and general appearance are a credit to the publisher.

Two reports by Prof. H. W. S. Cleveland, of Chicago, on possible park improvements in Providence, R. I., and in Minneapolis are full of suggestiveness and value for the residents and municipal authorities of other cities also. In Providence, Mr. Cleveland's treatment of "the Cove" would remove a source of danger by diverting sewage from that basin; while in Minneapolis his proposed boulevards he expressly urges as a protection against fire. Any one familiar with the localities in question must approve the main features of Mr. Cleveland's solution of what, in Providence at least, is a tolerably complex problem.

"The Folk-Lore of Yucatan" forms the subject of an interesting paper by Dr. D. G. Brinton in the *Folk-Lore Journal* for August. The native imagination revels in a singular variety of supernatural and malevolent beings, conspicuous among whom are the not unpoetic Balams, or gods of the cardinal points and of the winds and rains that proceed from them.

To match the series of delightful little volumes in which Mr. David Douglas, of Edinburgh, has presented to the British public what will in time be a complete edition of Mr. Howells's writings, Macmillan & Co. announce an 18mo edition of Mr. Henry James's novels and tales, to be contained in fourteen volumes, of which the 'Portrait of a Lady' will fill three, 'Roderick Hudson' and the 'American' two each, 'Washington Square,' 'Confidence,' and the 'Europeans' one each, while the remaining volumes contain the shorter stories, 'Daisy Miller,' the 'International Episode,' the 'Siege of London,' the 'Madonna of the Future,' etc.

Uniform with the Breakfast-Table series of Dr. Holmes and with the tales and travels of Mr. Howells, Mr. Douglas has issued Miss Howard's 'One Summer,' Mr. Burroughs's 'Winter Sunshine,' Mr. Stockton's 'Rudder Grange,' and Mr. Cable's 'Old Creole Days.' To these he will add at once Mr. Cable's 'Madame Delphine,' Mr. Burroughs's 'Locusts and Wild Honey,' Mr. Curtis's 'Prue and I,' and two other volumes not yet announced in America, Mr. Stockton's 'The Lady or the Tiger, with other Stories,' and Mr. Joel Chandler Harris's 'Mingo and Other Stories.' Altogether, this collection of American authors is one which Americans may contemplate with satisfaction. They are all published by arrangement with the authors.

Mr. Julian Hawthorne's 'Fortune's Fool' is published in London by Chatto & Windus; and as his other tales are included in the series of "Piccadilly Novels" issued by this firm, Mr. Hawthorne bids fair, like Mr. James and Mr. Howells, to have an English edition of his works.

The Paris daily newspaper, *Le Temps*, is now publishing, as a serial in its *feuilleton*, translations of stories by Mr. John Habberton, under the general title "Chez les Yankees."

The latest of M. Jules Claretie's contributions to the entertaining little series of 'Célébrités Contemporaines' are brief biographies of the late Jules Sandeau; of M. Paul Deroulède, the fiery patriotic poet of *la revanche;* of M. Ludovic Halévy; of M. François Coppée, the poet of modern life in Paris; and of M. Édouard Pailleron, the happy author of 'Le Monde où l'on s'ennuie,' who is about to be received into the French Academy, to which he was elected by the votes of some of those whom he was supposed to have satirized in that very lively and suc-

cessful comedy. The portraits, which accompany every biography, have greatly improved of late; the facsimiles of MS. are interesting at all times.

Polybiblion for September begins a bibliography of the Comte de Chambord, or of Chambordism, as we might say, bringing it down to 1839. It promises to be sufficiently voluminous.

An interesting discovery is reported from Munich. The bookseller Karl Fr. Meyer, in cataloguing the library that formerly belonged to the Carthusian monastery at Buxheim, found two leaves of a manuscript written upon parchment serving as fly-leaves to an early-printed book. On examination they turned out to be fragments of 'King Rother,' written toward the end of the thirteenth century. There are about 400 lines, belonging to a part of the poem of which hitherto only one manuscript was known. The newly-found text differs considerably from its predecessor, the Heidelberg manuscript, furnishing not merely various readings, but some new lines, and also omitting some.

—A manual or text-book upon the "Science of Food," on a plan drawn up by the late Sir Henry Cole, of the South Kensington Museum, has just been compiled by his eldest daughter, who presents herself to the public under the initials of L. M. C. The little volume is a model of clever arrangement and happy selection. It gives us chapters on food and its composition; food, its nutritive value; food and its functions; food and its selection; and provides further a series of questions on these vital subjects, somewhat similar to those set by the British Home Government in the "Food" branch of its teachings in Domestic Economy. Miss Cole has compiled her work from the best sources of information in the English language. Professor Huxley, Charles Darwin, Sir H. Thompson, and sundry physiologists lend their authority, and various official journals, guides, and inventories are quoted; while on the specially interesting subject of "Food and its selection," or, in plainer terms, 'marketing," Miss Cole has called to her aid five first-class West End tradesmen of London (their names are immortalized in the preface), dealing in fish and venison, butchers' meat, poultry and game, butter and cheese, and greengrocery. The text-book will repay careful reading; but there is an addendum on teaching cookery in schools, by the Rev. Newton Price, which we commend to the disciples, scattered far and wide, of Miss Parloa, Miss J. Corson, and other ladies concerned in advancing our culinary education, and causing "every-day cookery" to be added to the curriculum of our public seminaries. "In the Watford Health School, the time for dinner is half-past twelve, when about ten persons sit down to the meal—the teacher, the cooks, the cleaners, and as many more as are required to furnish the table with guests. *Each child who dines pays two pence (four cents)!* The teacher is expected to provide dinners the cost of which will not exceed three pence per head (six cents), and, as a matter of fact, for eight years this rate has never been exceeded." The trifling "loss on food" during the year did not quite reach $24, for which, with the $45 returned in dinner fees, 1,174 dinners were provided.

—The compulsory deposition of books in the National Library rests in France upon a different basis from the American. The Library of Congress receives one copy to serve as a proof of the publication of the book, and another copy as in a way a testimony of gratitude to the Government for maintaining the copyright. In France it is based on the necessity of police surveillance of literature. M. Georges Picot has written a pamphlet in which he proposes a third and better foundation for the practice so much complained of by publishers—the principle of the preservation of literary monuments and of scientific utility. *Polybiblion* points out that there are certain questions to be considered which M. Picot has not touched upon. Must everything printed be deposited? The number will be enormous. If not everything, who shall weed out the unnecessary part? Shall only what is published be deposited, or everything that is printed? If the latter, what is to be done when only one copy is printed? *Polybiblion* proposes to except *billoquets*, which we suppose to mean circulars, advertisements, billheads, commercial cards—matter that is neither literature nor science; and to claim the three copies from the author, giving him a right to collect them gratis from the publisher. The author, it thinks, for his own fame, now and with posterity, and from his desire to be useful in the world, would be much more likely to attend scrupulously to the deposit. To us it seems that a business man is more likely to attend in all cases to a business operation to which he is habituated, and the omission of which would bring a penalty upon him, than the often careless author, who may not know that he has anything to do, and usually will not know how to do it.

—Among Parisian journalists of the more pronounced Parisian type, no one is better known than M. Albert Wolff, one of the stars of the *Figaro*. M. Wolff is a Parisian of the Parisians, and his wit has the very latest boulevard flavor, and yet he is not even a Frenchman by birth. He is an imported Parisian, born in Germany, just as Fiorentino, another typical Parisian journalist, was an Italian. In the last century Grimm and Galiani were Frenchmen from Germany and Italy, just as Antony Hamilton, still a century earlier, was an Englishman. M. Wolff, even now that he is a Parisian and the chief writer of *chroniques* in the *Figaro*, and its art critic, does not seem to the profane outsider a very important or a very remarkable person. But in the eyes of M. Gustave Toudouze he is a great man indeed, and so M. Toudouze has devoted a volume of 368 substantial pages to M. Wolff's birth and youthful struggles and final success, his sayings and doings, the calumnies against him, and his propensity for gambling. The book is called 'Albert Wolff: histoire d'un chroniqueur parisien' (Paris: Favard; New York: F. W. Christern); and when he received it we incline to believe that M. Wolff longed for a chance to wring M. Toudouze's neck. M. Toudouze is not as humble or as skilful as Boswell, although he is perhaps quite as admiring; and M. Wolff is not a Johnson; and the result is that M. Toudouze in the best of faith makes a pitiful exhibition of M. Wolff in particular and of Parisian journalism in general. Almost the only thing of interest in the book is the assertion that M. Wolff, in conjunction with his friend M. Ernest Blum, was the author of the 'Memoirs of Thérèsa,' the comic singer—a book which had an enormous vogue in the latter days of the Second Empire. Prefixed to the volume is a portrait of M. Wolff, etched by M. Bastien-Lepage, which makes M. Wolff almost as unpleasant physically as M. Toudouze has shown him to be morally.

—A very curious conjectural emendation is proposed by M. Clermont-Ganneau in the *Revue Critique*. In the mediæval representations of the crucifixion of Christ, the soldier who pierces the side with a lance is often labelled Longinus, and the person who holds up a sponge dipped in vinegar at the end of a reed is labelled Stefaton or Stephaton or Stepiton. Now it has already been suggested that the name Longinus, *i. e.*, ΛΟΓΓΙΝΟΣ, is a misinterpretation of ΑΟΓΧΗΝ, a lance. M. Clermont-Ganneau suggests that ΣΤΕΦΑΤΟΝ is derived in the same way from ΣΠΟΓΓΗΝ, a sponge, the accusative form being used as in the case of λόγχην. The resemblance is not striking, yet if the two words be written one above the other, it will be seen that the eye of an ignorant or hasty copyist might well make a mistake. As a name, Stefaton is otherwise unknown, and it is difficult to see whence these names of the soldiers could have come if not from some such misunderstanding of the labels explaining the objects which they bore. M. Clermont-Ganneau does not stop here, but suggests that the name of the good robber Dysmas, who appears as a saint in the calendar of the Eastern Church, comes from the last word of the phrase εἰς τὰς δυσμάς, indicating the direction in which the face of Christ was turned, a matter about which there was a long controversy in the early church. The rest of the phrase (εἰς τὰς) he supposes to have been separated from the last part by the cross of Christ, and so to have been taken for the name of the robber on the right, ΕΙCΤΑC giving rise to the various forms in which the name is now found, ΕΤΕΓΑC, ΓICΤΑC, ΓΕΥCΤΑC, ΓΕCΤΑC.

—In No. 925 of the *Nation* we presented to our readers the grounds on which M. Naville, the Egypt Exploration Fund traveller, founded his identification of Pithom, the store city of Exodus, with the present Tell el-Maskhuta, near Ismailia. We alluded to the exultation with which the explorer reported his success, and to the hope of future revelations which the Honorary Secretary of the Fund based on the discovery, in the firm belief that the former had "found the very walls on which the enslaved Hebrews worked." We thought this hope to be a little too sanguine, and the belief exaggerated, even "if the identification is fully confirmed." Mr. Poole, however, and his learned colleague, Miss Amelia B. Edwards—as their frequent communications on the subject showed—continued to be enthusiastic about M. Naville's archæological achievement. And so was Professor Sayce, who is generally carried away by the faintest plausibility of a find in the obscure fields of Semitic or cognate research. "Menephtah," the latter wrote in the *Academy* of September 1, "whom Egyptologists . . . have long believed to have been the Pharaoh of the Exodus, . . . is now proved to have been so by M. Naville's recent excavations on the site of Pithom." Professor Lepsius, of Berlin, however, an Egyptologist of an entirely different calibre, was far from seeing things "proved" where there were only sufficient grounds for a conjecture worthy of examination. And, considering the conjecture carefully, he found that there were strong reasons for rejecting it, and he stated them in the last number of the *Zeitschrift für ägyptische Sprache und Alterthumskunde*. To this refutation of M. Naville's arguments Mr. Poole attempted a reply in the *Academy* of September 22; but the extreme weakness of his position is shown by his being driven to assume —"supposing the authority of the Itinerary [of Antoninus] to be of equal weight with the mentions of Pi-tum found by M. Naville in the scanty monuments of Tel-el-Maskhutah," which, we must say, few will doubt—"that there was a city called Pithom at either extremity of the Nome" in question, and thus "Tel-el-Maskhutah would . . . still represent the Pithom of Exodus." To Mr. Poole "the existence of two Pithoms within twenty-four Roman miles of each other presents no difficulty, for one would be specially designated, as in parallel cases." Such really parallel cases he ought to have pointed out.

TAYLOR'S ALPHABET.—II.

The Alphabet: an Account of the Origin and Development of Letters. By Isaac Taylor, M.A., LL.D. Vol. I. Semitic Alphabets; Vol. II. Aryan Alphabets. London: Kegan Paul, Trench & Co.; New York: Scribner & Welford. 1883. 2 vols. 8vo.

AFTER devoting a very interesting chapter to a discussion of the primitive form of the alphabet, the names and the phonetic powers of its various letters, and the order in which they were arranged, our author proceeds to give an elaborate account of the Phœnician alphabet, properly so called. Of this venerable alphabet there is only a single representative left in the line of direct descent, the Samaritan, "the sacred script of the few families who still keep alive the old life of Israel on the site of Sechem, and still worship, as of old, on Mount Gerizim." With this exception, it has become extinct, and is only known to us by inscriptions, of which several hundred have been discovered thus far. They can be divided into two distinct classes by easily recognized variations in the shape of certain letters, which form two well-marked alphabetic types. To the oldest of these the provisional name of the Moabite has been given (but for this the more comprehensive substitute of the Tyrian is suggested by the author), and to the second that of the Sidonian. The monuments belonging to the first, or Tyrian, epoch are exceedingly few, of which by far the most important is the celebrated Moabite Stone, or the inscription of King Mesha. This was discovered, in 1868, on the site of Dibon, the ancient capital of the land of Moab, and what portions of it have been preserved are now in the Louvre. It gives an account of the revolt of Mesha, King of Moab, against Jehoram, King of Israel, and can be referred with great precision to the year 890 B. C. Although so venerable a record, it is surpassed in antiquity by the inscriptions upon certain fragments of the sacred brass vessels belonging to the temple of Baal on Mount Lebanon, which were discovered in 1876 by M. Clermont-Ganneau, and are now in the cabinet of antiquities of the National Library at Paris. Upon sufficiently strong grounds, these have been assigned to the beginning of the tenth century, or possibly to the end of the eleventh. Inscriptions written in the second, or Sidonian, type of the Phœnician alphabet are very numerous. The most important is the inscription on the magnificent sarcophagus of Eshmunazar, King of Sidon, now one of the glories of the Louvre, to which the probable date of the fifth century B. C. has been assigned. From all the varied materials that have come down to our day the history of the alphabet of Phœnicia has been constructed, beginning with the reign of Solomon and ending with a coin struck at Tyre during the reign of Antoninus Pius, in the year 153 of the Christian era. After a brief account of the Punic alphabet—a direct descendant of the Phœnician, whose inscriptions, though numerous, possess comparatively little interest—the history of the development of its other offshoot, the Hebrew alphabet, is given with more detail. This has been rendered possible by the accidental discovery, so recently as June, 1880, of an inscription in the ancient tunnel which conveys water to the Pool of Siloam, and which, it is agreed, must be placed somewhere between the eighth and the sixth centuries. Thus a monument of the early Hebrew alphabet of unimpeachable authenticity and unrivalled in antiquity has been added to the little that previously was actually known of the ancient alphabet of Israel.

Herodotus tells us that "the Phœnicians introduced into Greece the knowledge of letters," and this, the universal belief of the ancient world, is fully confirmed by internal evidence. The names, the number, the order, and the forms of the letters of the primitive Greek alphabet attest its Semitic origin. Of this archaic alphabet our knowledge has been obtained by a series of inscriptions, upward of ten thousand in number, the earliest to which a definite date can be assigned having been discovered not in Greece, or in any of the numerous seats of Hellenic culture, but in the remote Nubian desert, almost beyond the confines of ancient civilization. Upon the colossal portrait-statues which Rameses the Great carved in the front of the stupendous cave-temple constructed at Abu Simbel, at a time when the Hebrews were still toiling in Egyptian bondage, certain Greek mercenaries in the service of Psammetichus, one of the kings of the twenty-sixth dynasty, toward the end of the seventh century B. C., inscribed a record of their visit in five precious lines of writing. These the dry Nubian atmosphere has left in almost their pristine sharpness, and they afford the first unassailable standing-ground for constructing the history of the early alphabet of Greece.

The Cadmean legend, according to which Cadmus, the Tyrian—in Semitic speech, "the man of the East"—sailed for Greece in search of Europa, the damsel who personified "the West," must be regarded as an eponymic myth referring to the exploration of western lands by eastern navigators. This legend designates the island of Thera as the earliest site of Phœnician colonization in the Ægean, and there inscriptions have been found in which, though the language is Greek, the forms of the letters are of the most primitive Phœnician type. So Thera may be regarded as the first spot of European soil on which words were written. Its modern name is Santorin, and it is an extinct volcano, whose crater, partially submerged, forms an excellent land-locked harbor. Two ancient cemeteries, half-buried beneath the ashes of some eruption of long ago, have yielded upward of twenty inscriptions, traced upon blocks of basalt, which contain the names of the Dorian settlers whose graves they cover. They extend over the whole period during which the change in the direction of writing took place. The older records are written in horizontal lines from right to left. Somewhat later we find a curved script running round the margin of the stone. This was succeeded by the *boustrophedon* writing, in which the lines proceed alternately from right to left and from left to right, as oxen, when ploughing, draw the alternate furrows in opposite directions. Finally came the more convenient habit of writing from left to right. The inscriptions from Thera exhibit better than any others the early form and the progressive evolution of the Cadmean alphabet. From other regions, especially from Athens, a few records have been obtained belonging to the same primitive period.

While Thera is claimed as the site of the first Phœnician colony, yet the Cadmean legend gives to Bœotia the glory of having been the birthplace of letters in Greece. Still, it so happens that no very ancient inscriptions have come to light in that country. The oldest monuments of Greek epigraphy which have been found on Hellenic soil, bearing a definite date, are inscriptions on the pedestals of the statues which lined the sacred way leading to the temple of Apollo at Branchidæ, near Miletus. Several of these are now in the British Museum, bearing various dates ranging over a considerable portion of the sixth century B. C. These belong not to the primitive alphabet, but to one of the local varieties—the Ionian—which mark the second stage in its history, and which may be designated as the Epoch of Transition. This began in the seventh century, and lasted to the close of the fifth, and in this period we have several important dated monuments exclusively of Ionian origin. It is not till the middle of the fifth century that we have any dated monuments belonging to any of the Western types, but these are of the very highest interest. Among them are the names of the allied states of Hellas, inscribed on the coils of the three-headed bronze serpent which supported the gold tripod, dedicated to the Delphian Apollo, 476 B. C., from the Persian spoils of the victory at Platææ. This famous monument was transported to Byzantium by Constantine the Great, and still stands in the Hippodrome at Constantinople. Of almost equal interest is the bronze Etruscan helmet, now in the British Museum, which was dedicated to the Olympian Zeus by Hiero I., King of Syracuse, in commemoration of the great victory off Cumæ, in which he destroyed the naval supremacy of the Etruscans. This battle was fought in the year 474 B. C., and is celebrated in an ode of Pindar. These two inscriptions serve as epigraphic standards to fix the dates of some very important undated monuments, among which are treaties between different states of Greece. The third epoch witnessed the emergence, through the action of the law of the survival of the fittest, of the classical alphabets of European culture—the Ionian and the Italic. The former of these was adopted by the Athenians by a formal decree, passed in the archonship of Euclid, 403 B. C., which ordained that the old Attic alphabet should be replaced in all public documents by the Ionian, which was already in literary use in many parts of Hellas. This Ionian alphabet has been the source of the Eastern scripts—the Romaic, the Coptic, the Slavic, and others. Of the Italic, which became the parent of the modern alphabets of western Europe, we will proceed to speak at somewhat greater length.

Probably about the ninth century B. C. there came colonies from Chalcis, in Eubœa, to Sicily and to Cumæ and Naples, in central Italy, bringing with them their own local type of alphabet, from which the various national alphabets of the Italic peoples derived their origin. These were the Etruscan, the Umbrian, the Oscan, and the Latin, which, owing to political causes, finally displaced the others. This primitive alphabet, used by the first settlers, may be conveniently designated the "Pelasgic"; and in the so-called "abecedaria" of Formello, Cære, and Colle we are furnished with authentic examples of it. These are alphabets scratched upon children's cups and buried with them in their graves, or painted in large letters upon the walls of rock-hewn tombs, as in the case of Colle, near Siena. This was discovered so long ago as 1698, but only the first sixteen letters could be deciphered, the rest having faded away. But in 1836 there was found at Cervetri, the ancient Cære, a little village on the coast midway between Rome and Civitavecchia, an ancient tomb, containing among other objects a small vase of plain black ware, now preserved in the Vatican, in the Museo Gregoriano. Round its base is engraved an alphabet almost complete, and on the body of it is rudely scratched a syllabary with various blunders and erasures. "Few more curious relics have come down to us from the ancient world than this insignificant 'Pelasgic ink-pot,' which probably formed the alphabet and primer of the child, in whose tomb it must have lain some five-and-twenty centuries." So late as 1882 another vase of black ware, in the shape of an amphora, was discovered in a tomb at Formello, near Veii, bearing an Etruscan inscription of ownership, together with a syllabary, and the Greek alphabet twice repeated. These two alphabets are of unique interest, as they contain archaic forms of every one of the

twenty-two primitive Phœnician letters, arranged precisely in the order in which they stand in the Semitic alphabet, while at the end are appended four additional signs of Greek origin. Besides these abecedaria, two others have been discovered giving a purely Etruscan form of the alphabet.

Upon the question of the origin of the Etruscan alphabet the opinion of scholars has been much divided. By some its peculiarities have been referred to the immediate influence of Greek potters, who immigrated into the country, the Eucheir and Eugrammos, the "Fine-Hand" and "Skilful Pencil" of ancient legend; others find the solution in a direct derivation from the Phœnician. If, however, we confine ourselves to the lapidary characters, its Chalcidian origin can hardly be gainsaid. In regard to the origin of the Latin alphabet, its Chalcidian affinities were first pointed out by Otfried Müller, and they have been recognized by Mommsen, and finally established by Kirchoff. As the alphabet of Rome, it became the alphabet of Latin Christendom and the literary alphabet of Europe. Although essentially identical with the Greek, seven of its letters differ more or less in their forms, three in their values and three in position; two, which became obsolete in Greek, were retained in Latin, and one new letter, G, was evolved. Like the Greek, the Latin alphabets are divided into four styles—capitals, uncials, cursives, and minuscules. Of the Roman capital letters, examples in use as early as the third century B. C. are to be seen in the well-known inscriptions upon the tombs of the Scipios now in the Vatican, and their form is practically the same as that now used by printers. The uncials were a formal book-hand, clear and legible, used by the professional scribes. The letters are not so square or so upright as in lapidary script; the forms are somewhat rounded, and have usually a slight inclination of the vertical strokes. The third script was a careless and rather irregular cursive character, employed for private letters and for keeping accounts. In 1875 a remarkable discovery was made at Pompeii of 132 wax tablets (*libelli*) written in this ancient cursive hand, and containing the business accounts of a banker, L. Cæcilius Jucundus, for the years 55 and 56 A. D. From a combination of the uncial and cursive scripts there sprung in the ninth century a new character, the minuscule, which became the book hand of the future.

Our author now enters upon the vast domain of Greek and Latin palæography, which of itself has become the subject of a copious literature, epitomizing briefly the history of the various mediæval alphabets, both in the East and the West, giving a short account of the most important manuscripts, and pointing out the landmarks of palæographic science, and finally referring the student to all the latest and best authorities. In fact, throughout this work we have noticed that great pains is taken everywhere to give a complete bibliography of the subject in hand. A variety of national scripts arose with the establishment of the Teutonic kingdoms upon the ruins of the Roman Empire. The most important of these were the Merovingian, the Lombardic, and the Visigothic, to which must be added the Irish, the most magnificent of all mediæval scripts, and which exercised a profound influence on the later alphabets of Europe. From a combination of the two great schools of caligraphy, the Roman and the Irish, arose the Anglo-Saxon script, the precursor of the so-called "Caroline minuscule," which was developed in the ninth century by the famous Alcuin, of York, the friend and preceptor of Charlemagne. This was the parent of the "Roman" alphabet in which our books are now printed, and which does not vary appreciably from the forms of the types used at Subiaco, Rome, and Venice by the Italian printers of the fifteenth century. But in the intervening centuries there had gradually crept in a deterioration in the art of writing, which resulted in the development, in the fourteenth century, of the Gothic, or black-letter, character. This was imitated by the first printers in their movable types, and these barbarous forms are still essentially retained by the Teutonic nations, though discarded by the English and the Latin races. But, from its superior excellences, the Roman alphabet is constantly extending its range, and it bids fair to become ultimately the sole alphabet of the future.

We have no space to follow our author further in his studies of the various Iranian and Indian alphabets, nor even in his interesting narrative of the development of the different alphabets of Hellenic origin, such as the Coptic, the Slavonic, the Albanian, and especially the mysterious Ogham characters of the ancient Irish. But we feel bound to notice briefly his discovery of the real origin of the Runic characters of northern Europe, as this appears to us to be his most important original contribution to knowledge.

In the Scandinavian lands there are to be found multitudes of inscriptions in the ancient alphabet of the Norsemen, which is called the Runic, and similar records occur over all the different regions that were overrun or settled by them, like the valley of the Danube or the British Isles. The oldest of them probably date as far back as the second century A. D., and they continued in use as late as the fourteenth. The alphabet goes by the name of the Futhorc, from the names of the first six letters, and, like the abecedaria, there have been found examples in which all the twenty-four letters occur in their regular order. Runes of different periods and countries exhibit considerable differences, but they can all be classified in three main divisions, the Gothic, the Anglian, and the Scandinavian, the primitive type being the Gothic. The numerous monuments bearing Runic inscriptions prove that the Scandinavian races were in possession of a definite and well-established alphabet before their dispersion began, but it differs so greatly from every known type that the question as to its origin has been a fruitful source of conjecture and controversy. The theory of Lenormant, that the Runes originated out of a Semitic alphabet transmitted by Phœnician merchants, is supported by no valid arguments, and the only possible sources left must be Hellenic or Italian. The Latin origin, though it has been strenuously advocated, is open, in Mr. Taylor's opinion, to very serious objections, geographical, chronological, and phonological. The Runes were unknown to the Teutonic tribes who came into early contact with the Romans, and yet this theory requires that they should have been transmitted from Gaul to the Baltic without leaving behind any trace of their passage. Not less formidable is the chronological difficulty; for the Runes date from the early empire, and this does not allow sufficient time to account for the differences which distinguish the characters from the Latin alphabet. Moreover, although the Latin alphabet offers easy prototypes for several of the characters, it affords no explanation for the origin of many others, which, however, can be explained without difficulty as derivatives from letters peculiar to Greece. Thus the Greek source remains the only possible hypothesis, and our author proceeds to a careful study of the manner in which the transmission may have taken place.

From the fourth century B. C. on, the Goths were in occupation of the region south of the Baltic and east of the Vistula, and in direct commercial intercourse with the Greek traders, who had long been established at Olbia, with whom they bartered the amber and furs of the north for the precious metals and various objects of Greek manufacture. Material evidences of this ancient commerce are common, such as the hoards of early Greek coins that have been dug up at Bromberg, in Posen, on the Lower Vistula, and near Kiev, on the Dnieper. Nor are other proofs wanting of the influence of Greek civilization in this region. From the Greek traders at Olbia the Goths could as readily have obtained a knowledge of the Greek alphabet as the Greeks themselves gained it from the Phœnicians. The probable date of this first acquaintance with letters goes as far back as the sixth century B. C. This is shown both by the forms of the Runic letters and by the fact that many of the oldest Runic inscriptions are either retrograde or boustrophedon in direction. The standard Greek alphabet of the fifth century does not supply so satisfactory prototypes for the Runes as does the earlier alphabet, which prevailed in Thrace and the Greek colonies on the Euxine during the sixth century, just before the commencement of the Persian war. In this certain forms were retained which afterward disappeared, and these peculiarities have been transmitted to the Runes. By his minute and technical study of all the individual Runic characters, and by the skilful manner in which he has pointed out the various changes they under went in the course of their evolution, and in the order of their arrangement, the author has produced a result so satisfactory that his arguments have met with general acceptance among scholars, including several who had previously advocated some other solution.

Here we must take leave of this valuable and interesting work, with the most hearty commendation of the talent, the learning, and the industry of the author, which have bestowed upon the world of letters a gift calculated to lighten the toil of succeeding generations of scholars.

RECENT POETRY.

THE poetry of the last season has been, like the season itself, cool and dry, with occasional impulses of extreme heat. The jets of warmth are not communicated, strange to say, by Mr. Swinburne, who comes before us in his 'Century of Roundels' (New York: Worthington) singing chastely and sweetly, but somewhat monotonously, the delights of parental affection and the charms of childhood. The roundel is, to our thinking, fitter for an occasional relish than for human nature's daily food, and the hundredth repetition of it must become cloying to any one. Yet this is Mr. Swinburne's whim, and he must have his way. But since a child is the most genuine thing in the universe, the poetry which would describe a child must not be weakened by a touch of affectation; and as there is nothing so endless as the variety in a child's life, it is a mistake to imprison it in a series of roundels. Nothing can be prettier than the following:

> "A little way, more soft and sweet
> Than fields adown with May,
> A babe's feet venturing scarce complete
> A little way.
>
> "Eyes full of dawning day
> Look up for mother's eyes to meet
> Too blithe for song to say,
>
> "Glad as the golden spring to greet
> Its first live leaflet's play,
> Love, laughing, leads the little feet
> A little way" (p. 55).

It is no wonder that Mr. Swinburne wishes to claim Catullus as his "brother" (p. 89), recalling, doubtless, a grace which even he cannot equal in that delicious description by the Roman poet:

"Torquatus volo parvulus
Matris e gremio suæ
Porrigens teneras manus
Dulce videat ad patrem
Semihiante labello."

But it is really a pleasure to see a man of Mr. Swinburne's genius appearing at last clothed and in his right mind; and we cannot wish him back in his period of outlawry.

Nor can we find any perilous torrid heats in Miss Ella Wheeler's 'Poems of Passion' (Chicago: Belford, Clarke & Co.), for the simple reason that the passionateness on which she seems to pride herself is really less poetic, as well as less womanly, than her calmer song. When she writes thus, for instance, she strikes an obviously false note:

"She touches my cheek, and I quiver—
I tremble with exquisite pains;
She sighs—like an overcharged river
My blood rushes on through my veins;
She smiles—and in mad-tiger fashion,
As a she-tiger fondles her own,
I clasp her with fierceness and passion,
And kiss her with shudder and groan" (p. 47).

There is surely nothing tempting about this. It is not the passion of Rossetti or Browning, nor even of Gautier and Baudelaire; it is a woman's crude imitation of all these. But when Miss Wheeler writes simply and calmly, keeping on her own ground of life and experience, she is strong—as in this really fine poem:

"LOVE'S COMING.

"She had looked for his coming as warriors come,
With the clash of arms and the bugle's call;
But he came instead with a stealthy tread,
Which she did not hear at all.

"She had thought how his armor would blaze in the sun,
As he rode like a prince to claim his bride:
In the sweet dim light of the falling night
She found him at her side.

"She had dreamed how the gaze of his strange, bold eye
Would wake her heart to a sudden glow:
She found in his face the familiar grace
Of a friend she used to know.

"She had dreamed how his coming would stir her soul,
As the ocean is stirred by the wild storm's strife:
He brought her the balm of a heavenly calm,
And a peace which crowned her life" (p. 75).

It is impossible to deny real passion, and of a sad and very poetic sort, to 'The Love-Poems of Louis Barnaval,' edited, with an introduction, by Charles De Kay (New York: D. Appleton & Co.). This remarkable volume takes a stride so far in advance of anything yet done by Mr. De Kay, that we can hardly wonder at the ready acceptance by the public of the "Louis Barnaval" authorship, laboriously fortified as it is by a prolonged memoir and by an actual dedication "to Maria Teresa de Kerleroz, formerly Maria Barnaval, of Tensas Parish, Louisiana." This is certainly carrying out an *alias* very boldly, if an *alias* it be; yet we can only say that, if there ever was a Louis Barnaval, his literary methods and whims and surprises were marvellous duplicates of those of his editor. Such lines as these recall the roughest places in Mr. De Kay's epics:

"Great God! these toads that still infest her way,
Huddle in holes and beastly propagate;
Anon, when Luna marches forth in state,
Majestic, amorous of departing day,
And shows the world that love is no disgrace,
Out crawl these toads and blubber in her face."
(p. 146).

It is a suspicious fact that there is nothing tropical but passion in these poems attributed to the young New Orleans creole. All the poetic allusions and properties, all the descriptions of nature, are drawn from his brief life of maturity at the North. His wild flowers—and they appear often, and are very genuinely painted—are the violet and wind flower, the mullein and the Indian pipe. Almost the only bit of Southern nature is in the poem on Pizarro, which has a dramatic quality apart from the fires of passion:

"When first he ravaged the Peruvian lands,
Pizarro, chief and torturer of his peers,
Imbibed through greedy, all-believing ears
Tales of the golden and the silvery strands,
Tales of a nation boastful by the water
Where streams like seas meet in a mightier flood,
Tales of the women who their flesh and blood
Spare not, but give each infant son to slaughter.

"Greed saw it rise, the glittering high-faned town
Far in the wood wastes; and desire, the shining
Of golden cornices, the gems entwining
Locks that the feathers of the war-bird crown.

"Thirsted for them the gross Pizarro spirit:
Set on, O comrades! at the last we know
Where fitly love lurks under woman's blow
In warrior wives who warrior souls inherit.
. . . . . .
"A Barnaval with many a comrade clashes
Sword on his helm. Alas for firm-set wills!
Alas for tangles of Madeira's hills!
The parrot screams among their moldering ashes"
(p. 105).

Echoes of passion—and of Keats—are to be found in a sumptuously printed volume, 'Poems Antique and Modern,' by Charles Leonard Moore (Philadelphia: J. E. Potter & Co.). The poems are smooth, exotic, cultivated, graceful, and a little cloying; but one of the best is on the home theme of Edgar Poe. There is an imaginative touch that would have pleased Poe himself in the closing lines:

"An altar in each heart for him shall burn
As long as sorrow lasts,
As long as Autumn, or the dim twilight,
Usurp the seats of Summer or throned Day,
As long as shadows thicken in our minds—
He reigns, who was the very spirit of strife,
Who was primeval to the hoary night,
Who was the god and image of decay;
And all the tossed waves and storm-stricken winds
Of distressed, human life
Answer to him, who, with the secret stars,
Rises o'er chaos to renew its wars" (p. 322).

The faults of Mr. Moore apparently are those of youth; but the author of these lines ought, with profounder personal experience and more concentration of his powers, to produce something of more value than this fair volume.

In strange contrast with these classic and romantic strains, comes again the pure and cloistered voice of Jones Very. It may be said of him, as was once said of Thoreau: "His range is narrow, but to be a master is to be a master." Of the meditative sonnet Jones Very was master; no one has ever done anything in that direction more genuine or of clearer note. It is as if the very finest essence of Puritanism had come distilled through the soul of one of Hawthorne's saintly women; and those who can recall Mr. Very in his prime, when first touched with the sense of religious mission that seemed to wrap a white mantle of purity around him, will enjoy the appreciative memoir by his friend, Mr. W. P. Andrews. It is a curious coincidence that a sleepy old town like Salem, Massachusetts, once the home of such dark tragedies and then of such busy enterprise, should in one year send forth the memoirs and literary remains of two such lofty, ascetic souls as Jones Very and Samuel Johnson.

Mr. Browning's 'Jocoseria' (Boston: Houghton, Mifflin & Co.) is in strange contrast to the smooth and meditative strains of the New England seer. Some of the poems are written in his most abstruse, others in his most jarring, mood; while others, as "Pambo," are simply a hammering out of some well-known legend, without improving it. Yet there occur some strains so melodious as to recall the author's early 'Dramatic Lyrics,' and almost all have a tantalizing gift of yielding more and more wisdom upon repeated reading—a power in which Browning still stands unequalled among his contemporaries; a power which makes of his especial disciples a class apart, and loyal to their master in precise proportion to the world's neglect.

There comes also from England a poem with this prolonged title, 'Mano: a Poetical History, of the time of the close of the Tenth Century, concerning the Adventures of a Norman Knight, which fell part in Normandy, part in Italy. In Four Books. By Richard Watson Dixon, Vicar of Hayton, Hon. Canon of Carlisle' (London: George Routledge & Sons). It belongs to the same class with Mr. Morris's or Mr. De Kay's very longest narrative poems, but is more languid than the one, while smoother than the other; and might serve for a whole summer-day's pleasure—perhaps, indeed, for a whole season's—to some young lady in a hammock, with a taste for that sort of thing. Yet we cannot assign to it a high or permanent place in literature; we should rather take the risk of awarding such place to a drama which comes to us from Rome—'Mary Magdalene: a Poem,' by Mrs. Richard Greenough (Boston: Osgood). Mrs. Greenough is the wife of the well-known sculptor, and the drama is suggested by his statue of Mary Magdalene at the tomb. The author is known in literature through an early volume of rather striking tales and one or two graceful lyrics, but none of these predicted the sustained power and the even excellence of this fine treatment of an oft-told story; and the historical painting and other accessories are eminently well done. More fortunate than his English compeer, Mr. Woolner, Mr. Greenough does not need to handle in person both pen and chisel; there is a division of labor in his household; and the poem of 'Mary Magdalene' shows in passages almost the vigor of Mr. Woolner's 'Pygmalion,' while softer and more Christian in its tone.

Among minor American volumes there is to be noted one called 'Dreams' (Boston: Cupples, Upham & Co.), chiefly noticeable for a poem of considerable length and some ability upon the early loves of Mary Wollstonecraft, whose name the author repeatedly misspells; an odd collection of 'Versicles,' by Isaac Flagg (Boston: Ginn, Heath & Co.), with some quaint and rather overdone translations from the livelier idyls of Theocritus; a rather striking Spanish poem on Niagara ('El Poema del Niagara': New York), by Juan Antonio Perez Bonalde, who dedicates his little volume to Castelar, and is himself the subject of a preliminary sketch by José Marti. There is also a collection, somewhat ambitious, but not without merit, of sonnets on the successive months, under the title of 'The Yearly Moons,' by Joseph H. Young (Philadelphia: Lippincott); a small volume of poems in dialect, 'The Old Swimmin' Hole and 'Leven More Poems,' by Benj. F. Johnson, of Boone [James Whitcomb Riley], (Indianapolis, Ind.: Geo. C. Hitt & Co.); and an attractive group of 'Poems from the Spanish of Fra Luis Ponce de Leon,' translated by Henry Phillips, jr. (Philadelphia: Privately printed). These last sustain the merit of the Spanish translations in Mr. Phillips's 'Poems from the Spanish and German' which appeared four or five years ago. Mr. Chas. F. Lummis has also sent out a new series of 'Birch-Bark Poems,' written and printed by himself, on a paper made of the material thus indicated, in Chillicothe, Ohio. There are also some new collections of poetry; as, for instance, a very well-devised little volume of 'Five-Minutes' Daily Readings of Poetry,' selected by an English editor, H. L. Sidney Lear (New York: Whittaker). With this may be classed 'Surf and Wave: The Sea as Sung by the Poets,' edited by Anne L. Ward (New York: Crowell & Co.). This volume we have, however, found very disappointing; its tawdry binding and very mediocre illustrations indicating a certain mediocrity in the book itself, which differs from its more fastidious predecessors in the same line, 'Thalatta' and 'Sea and Shore,' in being rather a collection than a selection, including a good deal that is commonplace and not worth reprinting. The editor has the advantage, however, of a theme that is inexhaustible, and of doing her work later than those who have made up previous collections.

No recent volume of the minor sort has given us so much real pleasure as 'Songs of Fair

Weather' (Boston: Osgood & Co.), by Maurice Thompson, the well-known writer on archery. Many of the poems are shot swift and straight as arrows, and the reader feels the very thrill in the air; while there are descriptions of nature which are real additions to our literature, they are so fresh and vigorous. A hundred odes on skylark and nightingale, written by young American bards who never saw or heard those celebrated performers, are not worth the flavor of Southern woodland life in lines like these:

"THE BLUE HERON.

"Where water-grass grows overgreen,
On damp, cool flats by gentle streams,
Still as a ghost and sad of mien,
With half-closed eyes, the heron dreams.

"Above him, in the sycamore,
The flicker beats a dull tattoo;
Through papaw groves the soft airs pour
Gold dust of blooms and fragrance new.

"And, from the thorn it loves so well,
The oriole flings out its strong,
Sharp lay, wrought in the crucible
Of its flame-circled soul of song.

"The heron nods. The charming runes
Of Nature's music thrill his dreams;
The joys of many Mays and Junes
Wash past him like cool summer streams.

"What tranquil life, what joyful rest,
To feel the touch of fragrant grass,
And doze like him, while tenderest
Dream-waves across my sleep would pass!"

THE DAWN OF ITALIAN INDEPENDENCE.

Lettere edite ed inedite di Camillo Cavour; raccolte ed illustrate da Luigi Chiala. Volume secondo, 1852–1858: Crimea, Congresso di Parigi, Plombières. (Pp. cccix.–453.) Torino: Roux e Favale. 1883.

CAVOUR succeeded Santa Rosa as Minister of Agriculture on October 11, 1850, and became Minister of Finance in the following April. On November 4, 1852, he was intrusted by the King with the formation of a Cabinet of which he was Premier. During the next five years the progress of Italy toward independence may best be followed by studying Cavour's career. A remarkably short time had sufficed to bring him to the foremost position in Piedmont; henceforth, his aim was to force Europe to recognize Piedmont as the leader of Italy. Few men have understood the task before them better than Cavour. He knew that practical commonsense, unromantic and persistent efforts at reform, unpoetical sacrifices, and systematic endeavors would in the end accomplish more than sentiment, enthusiasm, Carbonarism. Sardinia he wished to make a model constitutional kingdom. England he kept before him as a pattern. When he could justly call the world to witness that in liberalism and enlightenment Sardinia was the peer of the most progressive country in Europe; when he could prove that down-trodden and derided Italians were capable of the highest order of self-government; when he could point to the condition of the Lombards and the Neapolitans, confident that the contrast with the Piedmontese could not escape the most casual observer; then he felt that the liberation of the Peninsula could not be far off. He wished not only to gain the moral support of foreigners, but also to make sure that all Italians should look up to the stanch little kingdom of Victor Emmanuel as the home of liberty and the rallying-ground of their cause.

To appreciate the difficulties with which the Sardinian Premier was confronted we must recall the dismal condition of the people whose fortunes he had undertaken to guide. The battle of Novara left Piedmont without an army, and, what was worse, it confirmed the scoffers who had asserted that the Italians were deficient in military qualities. Education was still so largely in the hands of priests that it was a weapon of ignorance, not of progress. Even acknowledged Liberals were timid and doubtful. The State Treasury was empty. But under Gen. Alfonso La Marmora the regular army was remodelled; the fortifications along the Austrian frontiers were strengthened; means were adopted for a speedy mobilization of the reserve force upon an emergency. All this required money, which could only be provided by large loans involving heavier taxes. Public works of all kinds—particularly the construction of railways—were warmly encouraged. The school and electoral systems felt almost immediately the influence of Cavour's reforming genius.

Whatever he achieved was at first stubbornly opposed. The reactionaries were naturally his enemies, but more dangerous still was the lukewarmness or active opposition of Moderates of undoubted patriotism, who could not, however, understand the wisdom of Cavour's policy. Very soon he showed the Clericals that he would not stop short of active warfare in his dealings with the Vatican. He was the author of a bill sanctioning civil marriage, and of another abolishing the convents of Sardinia. Their possessions, valued at $20,000.000, were sold, the proceeds being devoted to the improvement of the regular clergy. This radical reform had scarcely been brought before the Parliament ere several members of the King's family died almost simultaneously, and the Papists did not let slip the excellent opportunity of declaring that Heaven was thereby avenging itself upon the wicked sovereign. Victor Emmanuel was too good a Catholic not to heed the Pope's words in matters spiritual, but he had also too much common sense ever to fall deeply into superstition. "They tell me," he said in the present case, "that God has wished to punish me because I have consented to these laws. He has taken away my mother, my wife, and my brother; they threaten me with still heavier punishments; but they do not seem to understand that a ruler who wishes to secure his own happiness in the next world must first assure the happiness of his subjects in this."

While these perplexing questions busied Cavour at home, he was not blind to events abroad. He was on the alert watching the complications in which the great Powers were rapidly becoming entangled, and he was the first to perceive how the approaching conflict in the Orient might be turned to the advantage of Piedmont. Even before Napoleon created himself Emperor, Cavour recognized in him a possible future ally, or at least one whose friendship would be worth keeping. In October, 1854, when as yet Sardinia had not joined fortunes with France and England, Cavour wrote to Dabormida: "If Sebastopol is taken we must compliment the Emperor. They wish the Government to confide this mission to Count Arese. In his quality of old friend, this mission would have something quite personal about it which would perhaps flatter Louis Napoleon. Besides, were he welcomed—and he could not but be—it would be a famous lesson for Austria. Think of it. The idea is somewhat novel."

More novel still was the idea which about that time took shape, that Sardinia should enter the Alliance of the Western Powers. She was not rich enough in either money or men to be of great assistance. The expedition must entail large expenditures, and how would it benefit Victor Emmanuel and the Italians? Cavour could not explain to the world that his chief object in sending troops to aid the Allies was to secure their active good-will so that they might even be induced to take arms in Italy's behalf. He could not reply directly to those enemies who asked pertinently what possible business Sardinia had to meddle with the affairs of the Crimea. The result silenced those who repeated the wearisome *Qu'allait il faire dans cette galère?* and established for ever the sagacity of Cavour's policy. In the spring of 1855 General La Marmora embarked with 18,000 soldiers. For several months Italy watched with anxiety for some military achievement. At last, on August 17, 1855, a telegram came to the War Office at Turin announcing that 50,000 Russians had been repulsed by the Piedmontese troops in the trenches of the Tchernaya. That exploit redeemed the martial prestige of the Italians.

The position which Piedmont took proved of unexpected value to the Allies because it decided Austria to remain neutral. Had she been true to her promises, or had she followed her wishes, she would have joined Russia. In that case, France and England would have been overmatched. Cavour's prompt action warned Austria that she would be obliged to fight again for her Italian possessions, and she therefore chose to keep out of the conflict. When the Congress of the Powers met at Paris early in 1856 to settle upon the terms of peace, she tried to exclude Cavour, who represented Piedmont, from the deliberations. Well had it been for her had she succeeded, for, on the 8th of April Cavour rose in the Congress and uttered his famous appeal for Italy. The plenipotentiaries who had assembled at Paris to discuss the boundaries of the Danubian provinces, found themselves suddenly forced to listen to the grievances of Italy. From that moment they knew that the Italian Question could no longer be ignored.

The years 1856–7–8 hastened the solution of the problem. Cavour's aim was to secure the active support of France and England, to propitiate Prussia and Russia, to strengthen Piedmont's position at home, to encourage the aspirations of Italians abroad, and by every means to deepen the shadow of unpopularity which fell upon Austria at the Congress. More than once it seemed that he must fail. Mazzini was a perpetual source of anxiety. The mad attempt of Orsini to assassinate Napoleon almost caused a rupture between France and Piedmont. The emissaries of the Vatican were busier and more insidious than ever. Famine, and consequent disease, added to the discontent of the people and the perplexities of the ministers. Nevertheless we can see now, although it was not plain then, that the indefatigable Prime Minister gained ground steadily during those three anxious years, which were to the champions of Italian independence what the hardships of Valley Forge were to the patriots of the American Revolution. The crowning event of this period was Cavour's interview with Napoleon at Plombières, on July 21, 1858. That meeting, which seemed so casual as to be insignificant, was one of the most important single scenes in the entire drama. Cavour, who had been taking a short vacation, stopped over night at the little town of Plombières. The Emperor happened to be there. The next day they drove together in a two-seated wagon, drawn by a single horse. No one accompanied them, Napoleon himself being the driver. They were gone eight hours. During that time Cavour had extracted from the Emperor the promise that French bayonets should help the Sardinians to expel the Austrians from Italy. That drive bore fruit in 1859 and the following years.

Signor Chiala gives 341 edited and inedited letters of Cavour in his second volume. In them we are able to trace the growth of the Premier's plans from the moment of their conception to their accomplishment. We hear his private reasons for a stroke of policy which in public he could not unreservedly explain. We are everywhere struck with the completeness, the universality of his statesmanship. Like Mr. Gladstone, he did the work of half-a-dozen ministers.

Evidences of his tact, his sense of humor, and of his affection for his intimates abound. But it is to his utterances upon the Italian Question that the historical student is naturally most attracted. On February 12, 1853, Cavour wrote Lord E. G. Hatherton concerning the clerical situation and Pius IX.: "Up to the present his efforts have only resulted in making him lose credit with us and in diminishing his influence. His efforts are completely impotent. The more he busies himself, the more the masses detach themselves from him: it is not to be said that on that account they cease to be Catholics, but with them the sentiment of being independent of the court of Rome becomes stronger every day." Again, he declared that "in spite of the utmost good-will it is impossible to get along with Rome. She is angry at our liberty, at our independence, much more than at the laws [relating to civil marriage, etc.] which tend to introduce into our country, in a moderate measure, what has existed for a half-century in every other Catholic country."

After the Austrian decree of February 13, 1853, by which the property of certain Lombard exiles living in Piedmont was confiscated, Cavour puts the situation forcibly before Massimo d'Azeglio, then in London:

"This act violates in the most flagrant manner every principle of equity and justice. It has no precedents in modern history, for the [French] Convention itself attacked the *émigrés*, but not those to whom it had given a release from French citizenship. We must go back to the Middle Ages, to the epoch of Guelfs and Ghibellines to find anything analogous. . . . Austria, in aiming at Sardinian citizens, has intended to cast a slur on our Government, to degrade it in the eyes of Italy and of Europe. She would succeed if, after repeated and vain protests, we *remained with our hands in our pockets*. This we cannot, we ought not do. We cannot allow the constitutional and liberal principles of which we are the defenders and custodians in the South of Europe, to be vilified."

Plainly, the sentence which we have italicized indicates that even in 1853 Cavour saw that, if the worst came about, Piedmont might be driven to choose a desperate struggle instead of dishonor. Three years later, he alluded to this possibility in terms that were not ambiguous. In an interview with Lord Clarendon, immediately after the famous appeal of April 8, 1856, Cavour said (we quote from a letter of his to Rattazzi):

"'My lord, what has passed at the Congress proves two things: first, that Austria is decided to persist in her system of oppression and violence toward Italy; second, that the efforts of diplomacy are impotent to modify her system. . . . My friends and I shall not fear to prepare ourselves for a terrible war, for a war to the death, for a war to the knife!' Here I paused. Lord Clarendon, without showing either surprise or disapprobation, said then: 'I believe you are right. Your position becomes very difficult. I believe an explosion is inevitable, only the moment has not come to talk of it openly.' I replied: 'I have given you proofs of my moderation and prudence. I believe that in politics one must be excessively reserved in words and excessively decided in actions. There are positions where there is less danger in an audacious move than in an excess of prudence. With La Marmora I am persuaded that we are in a state to begin war, and, however brief it may be, you will be forced to aid us.' Lord Clarendon replied with great vivacity: 'Oh! certainly, if you are in trouble you can count on us, and you will see with what energy we will come to your assistance.'"

Cavour had already thought out the details of the conflict as carefully as if he were sure of its immediate outbreak. In his mind he had prepared for everything, as he shows further on in the same letter:

"I believe it opportune," he confides to Rattazzi, "to go to London to talk with Palmerston and the other leaders of the Government. If they share Lord Clarendon's views, we must make ready quietly, get a loan of thirty millions, and upon the return of La Marmora [from the Crimea] give an ultimatum to Austria which she cannot accept, and begin the war. The Emperor cannot be averse to this war: he desires it at heart. He will certainly aid us if he sees England decided to enter the lists. Moreover, I will talk to the Emperor as I talked to Lord Clarendon. The last conversations I had with him and his ministers were of a kind to prepare the way for a warlike declaration. The only obstacle that I foresee is the *Pope*. What to do with him in case of an Italian war? I hope after reading this letter you will not think that I have been attacked with brain fever, or that I have fallen into a state of mental exaltation."

There are many other important extracts which we might make, but we have space for only one more. It is taken from a confidential letter addressed to General La Marmora, after Cavour's famous interview with Napoleon at Plombières. The Sardinian statesman thus sums up the result of that meeting:

"It was agreed, first, that the State of Massa and Carrara should be the cause or pretext of war; second, that the scope of the war should be the expulsion of the Austrians from Italy, and the constitution of the kingdom of Upper Italy, composed of the entire valley of the Po, of the Legations and Marches; third, the cession of Savoy to France—that of the county of Nice undecided; fourth, the Emperor believes himself sure of the coöperation of Russia and of the neutrality of England and Prussia. . . . The sole point not defined is that of the marriage of Princess Clotilde. The King had authorized me to agree only in case the Emperor made that a condition *sine qua non* of the alliance. Since the Emperor did not push his demands so far, as an honest man I did not assume the engagement. But I am convinced that he attaches the greatest importance to this marriage, and on it depends, if not the alliance, at least its final issue. . . . I left Plombières with my mind more serene. If the King consents to the marriage, I am confident, I will say almost certain, that within two years you will enter Vienna at the head of our victorious troops."

Signor Chiala's historical commentary, prefixed to the letters, contains much valuable crude material for readers to digest at their leisure. He has collated so many anecdotes and speeches that we are surprised he should have omitted a full report of Cavour's appeal at the Congress of Paris, and also Cavour's official account of the Plombières interview, which probably exists in the archives of the Italian State Department. With these exceptions the editing is generally satisfactory.

Essays, Modern.—Essays, Classical. By F. W. H. Myers. London and New York: Macmillan & Co. 1883. 2 vols.

THE leading essay in these two volumes, the paper on the "Greek Oracles," is reprinted from *Hellenica*. At the time of its original publication it attracted considerable attention among scholars as a serious attempt to vindicate the dignity of the Greek belief in Delphi, and to support on grounds of knowledge the Emersonian affirmation that the oracle "never fell from lips of cunning." The author treats mainly of this, the omphalos of earth, and traces its history from the time when it was hardly more than a centre of animistic superstition, through its blending of nature-worship with sorcery, until it became less the voice of Apollo than the conscience of Greece. Finally he reports its last mystic aspirations, when, like a long-extinct crater, it rekindled in the outflow of religious feeling in the first Christian centuries. This history, which mirrors the religious growth and spiritual needs of the Greek race for a thousand years, including without a break the passage of the mind from fetishism to pantheistic ecstasy, is necessarily profoundly interesting and suggestive. In recounting it the author shows such quick susceptibility to different moods of the religious emotion, and such apprehension of its phases, as to prove that, though a scholar and writing about a long-silent shrine, he is most interested in religion as alive and contemporary—if, indeed, its fortunes were not the thing nearest to his heart. In the additional essays, now collected from various sources, the predominant topic, whether introduced from the ethical, humanitarian, or philosophical side, is the same, and is treated with equal readiness of insight and fervency of sympathy. Thus, when, with the reticence and glow of personal attachment, he describes the charm of George Eliot, the seriousness and elevation of her life, he focuses his praise into a eulogy of her moral ideal; or he seems to recount the career of Mazzini mainly to celebrate the latter's self-derived religion; or, while apparently being tempted to assent to Renan's half-ironical, half-serious relegation of the supernatural to another world, he makes his most vigorous assault on scientific indifferentism. The curious and marked characteristic of this survey of the opinion of some of the most eminent moderns is, that Mr. Myers does not, as is usually the case with men of broad religious sympathies, spend his emotion in mere sentimental effusiveness; he evidently hopes for, if he does not expect, a scientific solution of the eternal secret. In the "Greek Oracles" he made a promise (which he now says he failed to keep, not because of the lack, but the abundance, of material) to illustrate the ancient mysteries by modern discoveries. In the face of Renan's contented agnosticism he takes occasion to suggest that Socrates held the same attitude toward physical science as is now maintained toward supernaturalism, so called, because of "the arbitrariness of the explanations and the inaccessibility of the phenomena." He reminds us repeatedly that no proper examination of certain phenomena, alleged through all time and among all races, has been made, and among these he classes the Resurrection, and in all respects he writes like a member, if not an evangelist, of the Society for Psychical Research. Certainly he seems to anticipate by such research some enlightenment in regard to the points at which the unseen world impinges on the seen, and the modes of facilitating intercourse between the two. These propositions are urged with such sincerity, such high and earnest feeling, and are so enforced by rich, if not eloquent, language, by effective quotation and skilful allusion, that one must possess a heart very insensible to the plausibilities of rhetoric not to wish the author God-speed should he ever thus find "that true interrogation which is the half of science."

Other portions of these essays, if less unusual, seem to us more valuable. The passages in which, commenting on the author of 'Natural Religion,' Mr. Myers insists on the equality in worth of all high emotion felt toward an ideal, as well through art or poetry or landscape as through the more distinctive media of religious feeling; and the essay on Rossetti, in which this part of his creed is most effectively stated—are powerfully and suggestively done. His denial of the worship of Victor Hugo is just such a delightful blending of the serious and the droll as a modern "Get thee behind me, Satan," should be. But in singling out the best for praise, that for which the volumes are worth possessing, there can be no hesitation—it is the paper on Virgil. Many a vapid translation in late days had almost convinced us that the knowledge of Virgil was gone; but here is a writer, deeply versed in the classics, and unterrified by the Germans, who has the skill and boldness to make Dante's Guide credible by criticism. It is an admirable essay, at once learned, temperate, and almost affectionate in its sympathy, while it is no less marked by historical grasp than by poetic sensitiveness.

Heroes of Literature: English Poets. A Book for Young Readers. By John Dennis. London: Society for Promoting Christian Knowledge; New York: E. & J. B. Young & Co. 1883.

THIS title is merely a catchword (the book is one of a series), and misleading. The volume it labels does not contain an account of those poets only whose lives were heroic, nor is it written, as one would suppose, in a vein to interest the young imagination. The "heroes" are all the notable authors in English poetry since Chaucer, irrespective of their moral character or the splendor or romance of their career. Seventy-nine of these worthies are mentioned, and of most of them brief biographies are given, in chronological order, together with some sound criticism, and especially some advice in regard to which of their poems are interesting and profitable to the youthful reader. The author does not claim any originality. The facts and opinions he has taken from the best literary specialists; the advice is conventional, and somewhat more marked than is usual by that consideration of what is "proper" for English boys and girls to think and know which seems to dominate their early education. Thus, in allowing that Burns's song, "A man's a man for a' that," contains a highly admirable sentiment, Mr. Dennis carefully tells his supposed childish audience that "the distinctions of rank and wealth are necessary to the healthy growth of a state, and that, if it were possible to place all men on a level, some of the fairest and noblest virtues of the race would disappear." But he naïvely adds: "This was not evident to Burns." In such solicitude for the respect to be paid by well-bred youth to "his lordship," and in the surely inaccurate statement that Shakspere's dramas are not found in the hands of English laborers and artisans, there is the suggestion of a social bias, as there is a hint of limited appreciativeness in the fact that the only full quotations are from Cowper and Thomson; while the quiet assumption that only those children who are in the English Church will be interested in literature, strikes an American, and we should think would strike a Nonconformist at home, as inexpressibly comical. Such things as these, however, are only curious. The cheapness and information of the manual are not marred by its high and somewhat dusty respectability; it will be serviceable enough to pupils already engaged in the study, but it is not likely of itself to awaken a lively interest in literature in the ordinary American boy.

BOOKS OF THE WEEK.

Belot, A. Fedora; or, The Tragedy in the Rue de la Paix. Chicago: Rand, McNally & Co. $1.
Beyond the Sunrise. Observations of Two Travellers. John W. Lovell Co. 20 cents.
Blackie, J. S. The Wisdom of Goethe. Charles Scribner's Sons. $1 25.

Importer of Foreign Books, Agent for the leading Paris Publishers, Tauchnitz's British Authors, Teubner's Greek and Latin Classics. Catalogue of stock mailed on demand. A large assortment always on hand, and new books received from Paris and Leipzig as soon as issued.

GERMAN rapidly and conversationally taught in a few months. Send for circular.
JULIUS, 27 Union Square, Room 13.

A Most Reliable and Valuable Work of Reference.

A DICTIONARY OF QUOTATIONS
FROM THE POETS. Based upon Bohn's edition, with numerous additions from American authors. Carefully revised and corrected, with index of authors and chronological data, and a concordance index to every passage in the volume. Introductory preface by R. H. Stoddard.

8vo, 768 pp. $2 50
Revised edition 3 50

"The system of indexing by numbering the passages, and referring by numbers in the Index of Authors and Genera... is a very thorough piece of work."—*Good Literature.*
"Not only very comprehensive, but is also admirably indexed and arranged."—*Yale Courant, Yale Union.*
"The more competent the person who examines it, the heartier will be his favorable verdict."—*Congregationalist.*
"The commendation of R. H. Stoddard, which is embodied as a preface, is a sufficient testimonial to its merits."—*Boston Pilot.*
"For variety, fulness of illustration of each topic, scope and value of the quotations, the work is superior to any other with which I am acquainted. It should find a place in every library."—*Cyrus Northrop, Prof. of Rhetoric and English Literature in Yale College.*
"It has been compiled with excellent judgment, and evidently with great care, and is printed and indexed in a way to satisfy the most exacting. It is a useful and attractive book."—*Prof. Edward H. Griffin, Williams College, Mass.*
"It seems to be unusually full and accurate. I tested it on various critical passages, and found it always correct."—*Prof. Wm. Hand Browne, Johns Hopkins University.*
"A vast improvement upon Bohn's original compendium."—*E. C. Stedman.*

For sale by all booksellers.

The Nation.

NEW YORK, THURSDAY, OCTOBER 25, 1883.

The Week.

THE official figures from Ohio show a majority of about 70,000 against the prohibitory amendment. This was cast almost entirely by the cities. In eighty-three counties of the State the amendment had a clear majority of nearly 5,000, but in the remaining five counties, which contain the large cities, the majority against it exceeded 75,000. In Cincinnati over 60,000 votes were cast against it, and only 8,000 for it. In Cleveland, Columbus, Toledo, and other cities the vote was in the ratio of about two to one against it. The meaning of these figures is obvious enough. In the rural sections of the State, where the difficulties in the way of enforcing prohibitory laws are comparatively slight, the sentiment in favor of such legislation has gained remarkable strength. Both Republicans and Democrats are in favor of it. Eleven counties which gave majorities for Hancock in 1880 have cast majorities in favor of the amendment, and the entirely reasonable estimate is made that one-third of the total prohibition vote was cast by Democrats. In the cities, however, the tide of sentiment runs almost as strongly in the other direction. The vote against prohibition in them is so large as to preclude the possibility of explaining it as being due mainly to the combined opposition of the liquor interests. The opposition was undoubtedly swelled by the votes of many temperance people who believe that license is a more practicable check to intemperance than prohibition.

Massachusetts Democrats are predicting Butler's defeat by 20,000 Republican majority, and the reason they give for it has been apparent to close observers of the campaign from the start. They will allow him to be beaten because if he is elected he will appear before the Democratic National Convention and demand a nomination for President. If he were refused this, they are afraid he would bolt and run as an independent candidate, drawing away enough support from the Democrats to defeat their ticket. By letting him be disastrously defeated now, they think they will so destroy him politically as to make his future movements comparatively harmless. This is the view taken by Democratic authorities in all parts of the country, and even if he is defeated, Butler ought to be able to derive a grim sort of satisfaction from the spectacle of the leaders of a great political party running away from him at the top of their speed lest he make a sudden grab and kidnap the whole party.

One of the great difficulties in Butler's path of reform during the past year has been the difficulty of proving that the tanning of the skins of paupers had become one of the State industries. He has relied considerably on this tanning for reëlection, but has been much bothered by the scarcity of proof. All that he was able to make out was that one skin had been tanned at some time or other, probably by some medical student, while what he wished to make out was that the tanning of paupers' skins was a branch of local manufacture fostered and encouraged by the State Government and the Republican party. The situation was becoming more serious as the election drew near and no fresh evidence was forthcoming. But relief has at last appeared, just where we might have expected it to appear, in the testimony taken by the famous Senate Committee on Education and Labor. A tanner named Chase, who is out of, and says he finds difficulty in getting, employment, owing to prejudiced employers having black marks against him on their books, has turned up as a witness, and says he has seen a great deal of this tanning, and "that the business has increased of late years," but "was stopped four months ago," of course owing to Butler's exposures. Becoming more particular, he said he had seen "several whole hides of women" that had been tanned, and extremely well tanned, for they "looked as natural as life." Chase is evidently ready to tell as much more about this business as may be necessary between now and the first week in November, and for reasons probably not remotely connected with the difficulty of obtaining employment, from which he says he suffers.

The market for American railroad securities has within the last week shown the first symptoms of a reaction from the decline which has continued almost without interruption for several months. It is of course well known that a general decline has been in progress for nearly two years. But the decline of the last four or five months had scarcely been interrupted by any reaction until it began to appear last week that the stock market, at least, had been immensely oversold by speculators, and that a gradual absorption of stocks by purchasing investors during the last few months had taken a large amount out of the market. Whether this is anything more than a merely temporary reaction it is impossible to say. That there has been a vast amount of idle capital awaiting some sort of investment that will pay a moderate but certain interest, is well known. But it is still an open question whether the late withdrawals of railroad stocks should not be regarded as speculation instead of investment for dividends. If so, an advance of 10 or 15 per cent. would bring the major portion of these stocks into the market again, and the situation would not be greatly different from what it was before. There is nothing to show that confidence in railway management generally, or in the general aspect of commercial and industrial affairs, has been restored in any considerable degree. The facts still remain that the railroad mileage of the country has in the last few years grown faster than the traffic of the country, and that the excess of railroad building has caused an increase of the plants of iron mills and the output of coal properties to a point in excess of the requirements of the country, unless the increase of railroad mileage is to continue. But this cannot be, and the iron and coal trades have perhaps not yet seen their lowest point of depression. Hence, one may doubt whether the vast amount of securities in the market will find purchases for investment at present prices. For the first time this year the rates of sterling exchange have declined to a point at which it will pay to import specie.

The tangle in which the "bears" in Northern Pacific preferred involved themselves on Saturday is perhaps the most curious phenomenon in the history of the Stock Exchange. Weeks ago it was announced by public advertisement that the transfer books for this stock would close on Saturday for the purpose of voting on the question of a mortgage. It was perfectly plain that the stock would "corner" itself if let alone, and that anybody who was "short" of it would be placed in a position of peril. These facts were so well understood that holders of the stock naturally supposed that the "short interest" would be practically eliminated before the day fixed for closing the books. This belief was so commonly entertained that very shrewd observers on the long side of the account, whose shares were not locked up in the transfer office, made haste to sell their stock early in the day at 4 or 5 per cent. premium, and were astounded to see the price advance to 17¼ per cent. premium before 3 o'clock. The only explanation of the affair is that the bears in the market, emboldened by a long and successful campaign, had become stone-blind to the plainest facts. There is no evidence that anybody made any profit out of the "corner" except a few fortunate holders who were indifferent to the vote on the mortgage question, and who happened to have their shares in convenient places where they could be hurried to the market for the sake of the premium. All that was needful to produce a corner was for the bears to set at defiance all the facts known to them. This they appear to have done in the present case. It is seldom that so large a price is paid for so little information.

Among the many suggestions made for either getting rid of the silver dollar or putting it to some use, that which proposes the suppression of the one and two-dollar notes seems to be the most feasible. If these notes were out of the way, a vacuum would be created for about $60,000,000 of silver. The liberation of this amount would be a great relief to the overburdened vaults of the treasury, and would postpone but would not avert the crisis which must come if the two-millions-per-month law continues in force. The objection raised against the suppression of the small notes—that without them we should have nothing with which to make small remittances in letters—has been removed by the introduction of the postal notes. An indirect gain from the suppression of the small notes and the substitution of silver, would be

found in the practical experience gained in carrying silver dollars. Sixty millions of these dollars weigh about two thousand tons. This weight distributed in the pockets of the people and carried around for a year, wearing holes in their trowsers, could not fail to have a wholesome influence upon public opinion, and would lead many people to take a more concrete view of the silver question than they have heretofore held.

The surplus revenues of the Government having again become a public nuisance, despite the large reductions in taxation effected last winter, it becomes necessary to look at the sources of the income and decide which of them shall be choked. The most hasty examination of the subject discloses two articles of consumption of nearly equal productiveness in the way of revenue, but very different in all other respects, viz., sugar and whiskey. Each yielded upward of $50,000,000 of revenue during the last fiscal year. The duties on sugar were lowered a trifle last winter, but it is likely that the increased consumption will soon bring the total revenue from this source up to the former figures. The protectionists call for a "clean sweep" of all internal taxation, including the tax on distilled and fermented liquors. The revenue reformers urge a reduction of the tariff sufficient in amount to cut off an equal sum. The temperance people, who are probably more numerous and certainly more active than the protectionists and revenue reformers combined, are justly horrified at a measure which proposes to reduce the prime cost of alcoholic liquor to twenty cents per gallon. The ideal measure to them would be a tax so high as to be prohibitory, or, better still, the destruction of all distilleries by fire. Neither prohibition nor destruction being possible through national legislation, the forces of temperance are leagued with those of revenue reform in solid phalanx to prevent any cheapening of the cost of liquor to the dram-drinker.

The application of the term "dude" to a particular kind of dandy has led to the use of it by a great many people as a term of reproach for all well-dressed persons whom they dislike, and, like all nicknames, is a labor-saving invention. Mr. Tourgée, the author of 'The Fool's Errand,' who has taken to lecturing, without any very good reason as far as we can see, has now turned the term to better account than ever by preparing a lecture on the dude. He uses the word to describe all sorts of persons with whom he does not agree or does not approve of. He has his literary dudes, and his political dudes, and his fashionable, sporting, and artistic dudes; but from his account of them one can see no reason in the world for calling them dudes, except that Mr. Tourgée does not like them. He might just as well call them kangaroos or prairie-dogs. We are afraid that Thackeray's 'Book of Snobs' has been too much in the lecturer's hands lately, but that in perusing it he has failed to perceive that Thackeray was careful to describe nobody in any sphere as a "snob" who did not exhibit the great snob characteristic, "mean admiration of mean things."

The President of a New England woollen company testified before the Senate Labor Committee in Boston on Wednesday that the condition of manufacturing industries in this country was not very prosperous because production was in excess of consumption. As for woollen manufacturing, he said it was a lamentable fact that Americans were getting out of it and foreigners were doing the most of the work. He thought free trade would put an end to it entirely for a time, and when asked if he thought that would be a good thing to do, declined to answer. He thought the present duties were high enough, however, thus intimating that, whatever the trouble might be, the remedy for it could not be found in protection. The real causes for the present state of affairs are not far to seek. The protective duties have given such a false stimulus to woollen manufacturing during the past few years that the supply has greatly exceeded the demand. This was so evident to the manufacturers at the beginning of the year that they agreed to run only two-thirds of their machinery, in the hope of warding off trouble from over-production. It is evident now that they took the alarm too late. Another cause has been the inferior quality of the productions. All jobbers in woollens complain of the lack of enterprise shown by American manufacturers in designing new styles and patterns, and say they put themselves outside the market by producing year after year the same kinds of goods. This has long been recognized as one of the most damaging effects of protection, which deprives business of that constant exercise of ingenuity and invention which an unrestricted competition makes absolutely essential to success.

The Atlanta (Ga.) *Constitution* calls the attention of the Southern farmers with much emphasis to the fact that they do not get as much money from a good crop of cotton as from a poor one. It quotes from Latham, Alexander & Co.'s cotton book to show that while 4,600,000 bales in 1875–6 brought $399,000,000, last year a crop of 6,900,000 brought only $327,000,000, or, in other words, although the latter crop was larger than the former by 2,300,000 bales, it brought $72,000,000 less money. In 1880–81 6,600,000 bales brought $336,000,000, or $9,000,000 in excess of last year, though there were 300,000 fewer bales sold. It calculates that the cotton crop of the last three years brought $1,000,000,000 into the South, but it says it went away to the North to enrich "money-changers and food misers," or in other words went to purchase corn, grain, and meat which the South could raise at home. The meaning of all this, it says, is plain:

> "Good prices come with moderate crops. Big crops tumble the prices down to the point of general demoralization and loss. If the South could confine the crop to 5,500.000 bales a year for three years she would realize more money than if she raised three annual crops of 7,000,000 bales."

It therefore advises Southern farmers persistently to shorten the acreage of their cotton and extend the limits of their grain-fields and pastures, with the object simply of keeping the money she sends away for provisions and forage at home; which, on this plan, would make the South "plenteously rich." At present "her labor enriches other sections, while she is kept in poverty and subjection."

What is curious about all this, as a piece of advice coming from a writer who professes to understand business and addressed to business men, is that it contains no calculation of what it costs the South to import its provisions, and no comparison between the value of a crop of corn and a crop of cotton raised on the same acreage. Whether it pays a Southern farmer better to grow cotton, of course depends partly on what he has to pay for his corn, and not, as the *Constitution* seems to think, wholly on what he gets for his cotton. If an acre of cotton brings $100 in a year of moderate crops, and the corn which would have grown on it can be bought for $60, it would be folly to grow the corn because in years of large crops the cotton only brings $90 or $80. In other words, a farmer has to keep his accounts like other people if he wishes to avoid bankruptcy or poverty. He must grow what he gets most for, and buy what he can buy for less than he could raise it for. And this calculation of the comparative merits of cotton and corn as a crop of course every farmer can and must make for himself, and probably does make for himself, and acts on the result. The notion of the *Constitution* that the $1,000,000,000 received for cotton would make the South "plenteously rich," if kept in the country and not sent away for commodities, is an interesting specimen of protection in its earliest stage.

The Medical Liberals won what is probably a decisive victory over the Conservatives at the meeting of the County Medical Society on Monday, electing their ticket by 375 to 220. They had a powerful reinforcement of new members, whose appearance seems to have taken the others by surprise and led to some unpleasantness. But, on the whole, the proceedings seem to have been harmonious, and nothing more serious occurred than the "taking down" of some remarks of an unparliamentary character. We presume the affair will have no direct effect on the quarrel of the codes, but it will undoubtedly make the new-code men feel themselves masters of the situation, and perhaps lead some of them to revel in consultation with homœopathists. The controversy will probably settle itself, as so many controversies now settle themselves, by the triumph of rationality. Doctors who think they can do any good by consulting with homœopathists will consult with them. Those who do not think so will not consult with them, and so no harm will be done. The whole quarrel reminds one of the story of the Episcopalian lady who went with her Baptist married daughter, whom she was visiting, to the Close Communion Baptist Church, and took the communion there. The deacons were much annoyed, and reported the matter, with some indignation, to the wise old pastor, and asked what should be done. "Well," said he, "watch and see if she does it again, and if she does, take my gold-headed cane from the vestry, and hit her smartly over the head with it."

Mr. Frank Hatton's recommendation that city postage should be reduced to one cent is worthy of attention on all grounds but one, and that is, that the existence of two kinds of postage-stamps for first-class matter is a constant source of confusion and delay. It opens up a daily opportunity for everybody to make the old mistake of putting a one-cent stamp on a two-cent letter. This ought not to be a serious matter, but the Post-office makes it a serious matter. It refuses to forward the letter under these circumstances, and thus exposes the sender to delay that may be very mischievous. One of the great comforts and advantages of the late reduction of postage to two cents all round is the getting rid of the two rates. It will be a great inconvenience if we have to go back to it under the old rules. If we are to have it again, the Post-office should forward *all* insufficiently-stamped letters, and collect the balance due on delivery, as the English post-office does. The penalty inflicted for the trifling mistake of putting on one stamp instead of another was tremendous enough to be ludicrous. No man's letter on which any attempt at prepayment has been made, ought to be stopped in transitu, except as a punishment for fraud.

Mr. Hatton's other suggestion, that there should be special rates and special messengers for letters requiring immediate delivery, seems open to somewhat the same sort of objection. A first-rate postal service in cities would and ought to deliver all letters as quickly as any letter can be delivered, and at uniform rates. It would be impossible to set up this special service without diverting to it some of the postal zeal, and money, and energy which are needed for all letters. The introduction, too, of a new corps of officials who would sometimes have too much to do and sometimes not enough, would probably create a good deal of confusion and laxity of discipline. It is not well for the Government to have in its employ a body of men or boys exposed to periods of idleness. It ought to have no one in its service whom it does not keep going all the time. Moreover, the special messenger service is already abundantly supplied for those who can afford to pay for it, in this city at least, and at very reasonable rates, by the District Telegraph Companies. Therefore, if anything can be done to expedite the city delivery, we think it ought to be done for all, and without extra charge. In London it is now so prompt that it has taken the place of special messengers even for invitations to dinner and the answers thereto.

The Newburghers have celebrated the hundredth anniversary of the last act in the great drama of the Revolutionary war—the disbandment of the army and its return to peaceful pursuits, to live under a new political order, and to witness the rise and progress of ideas and institutions of which only the faintest signs were then visible on the horizon. There were probably but few of the actors who had then any perception of the real greatness of the occasion. If there had been many it would perhaps not have been marked by so much heroic simplicity. The self-consciousness which the activity and influence of the press have since diffused through the community, and which makes us all look round to see if the reporters are present before we will consent to say fine things or do great deeds, was then unknown. The written style of the time was a little stilted, it is true, but the men and women were not. The Newburgh episode is perhaps most memorable as having given the finishing touch to Washington's fame. It was the critical period in his career—the period at which so many preceding politico-military heroes had failed, and more particularly his Anglo-Saxon predecessor, Cromwell. In fact, the great military chiefs who can advise the army to go home when the war is over, and put away power which it not only offers but can bestow, have been so few, that if Newburgh was celebrating Washington's conduct on this occasion, and nothing else, it would be celebrating one of the great events of human history. The last seven years have been studded thickly with Revolutionary anniversaries, but Newburgh commemorated what was, in moral significance, as the final test of the political capacity of the people and their leaders, the greatest event of the war.

The controversy between the Government officials and the officers of the Arctic relief expedition is bringing out a good many disagreeable facts. The main point at issue, as to who was responsible for the failure to accomplish anything for the relief of the Greely party, is still undecided, but enough has been revealed on both sides to show that the expedition was sent out in many respects inadequately equipped for the task assigned to it. The official instructions seem to have been lacking in explicitness, and the crew of one of the vessels was apparently as bad a lot of men as could well be got together. The conduct of those in command is at least open to the charge of bad judgment, and the general verdict upon the expedition is likely to be that it was badly managed throughout.

The news comes from Lima that a treaty of peace has been formally signed between Chili and Peru. This is doubtless the Iglesias treaty, by which Chili takes the nitrate and guano territory, without assuming any portion of the Peruvian debt of $200,000,000, and Iglesias takes charge of the Government of Peru. This leaves Peru stripped of her most valuable possessions, and gives the French and English holders of her bonds anything but a cheerful outlook. Iglesias has given evidence of a disposition to govern wisely, and to allow the country a period of repose and order in which to recover from the losses of this long and costly struggle. He will come into power with assurances of popular support, and if he keeps the promises of his pronunciamiento of a few months ago, his Presidency will be a fortunate one for Peru.

London *Truth*, which has the knack of giving the "true inwardness" of a good many social as well as political phenomena, publishes a letter from Paris which throws some new and probably correct light on the late Parisian insults to the King of Spain. It says that a feeling of irritation has been rapidly growing among the Parisian population, including the members of the Government, over the manners of the royal personages who still frequent the city, sometimes, as in Alfonso's case, in their full state, and at other times under the transparent disguise known as "incognito." When they go there incog., however, they are very apt, and not unnaturally, to frequent exclusively the society, whether Bonapartist or Legitimist, of what once was the governing class in France, but is so no longer. It is the society which they like best and to which they naturally belong—the aristocratic society, in short. But it so happens that this society now not only feels, but freely expresses, supreme contempt, not simply for the Republican Government under which it lives, but for the men personally who carry it on, on account of their humble origin and plain manners. It appears now that some royal personages, Alfonso among the number, when in this society permit themselves to share in the sneers and ridicule which its members heap on the Republican Ministers, and more particularly on their wives and daughters, and have, indeed, indulged in the immense impertinence of taking no notice of the ladies of President Grévy's family. The Princess of Wales is said to be the only English lady of the royal family who has called on Mme. Grévy on her visits to Paris. The others simply allow their husbands to return M. Grévy's visits.

What adds to the sting of all this is that it is an attempt to place the French Ministry in the position of social inferiority which royal and aristocratic personages in England and Germany mark out for bishops, judges, professors, literary men, and artists, by accepting or seeking the society of the husbands while snubbing or ignoring the wives. The husbands in these countries have always submitted to this sort of impertinence, some because they do not care, and others because, though they do care, there is no help for it. No man of ordinary sensitiveness likes to advertise to the world the fact that there are houses to which he had to go, or liked to go, in which his wife was not welcome. A great many, too, as in Carlyle's case, enjoy aristocratic company so much that they do not mind leaving their wives at home to chew the cud of sweet and bitter fancy, while they are being flattered and petted by duchesses and countesses. But the President of a republic of course cannot allow himself to be made the object of calculated bad manners, or permit any one to indicate in Paris, at least, that there is society too good for his wife. So M. Grévy has been driven into open resistance by refusing to accord any civilities to distinguished strangers which they were not ready to return. It was rumored, too, that Alfonso had made fun of republican manners, an indiscretion which might be forgiven in as young a man as he is; but a young man who commits it ought not to go to Paris in the character of a friendly sovereign. Anyhow the report of it, probably coupled with gossip about other slights which the President had had to endure, led the mob, it is said, to prepare a reception for the royal stranger which was anything but courteous.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, October 17, to TUESDAY, October 23, 1883, inclusive.]

DOMESTIC.

THE Comptroller of the Currency has completed his calculation of the effect upon the national-bank circulation of the recent call of $15,000,000 of 3 per cents. It shows that more banks and a greater amount of national-bank notes are affected than was supposed. The second call touches the circulation security of 144 banks, and affects $8,352,000 of circulation.

The report of the free-delivery service of the Post-office Department for the fiscal year ending June 30, shows that during the year 42 offices were added to the list of "free-delivery" cities, making a total of 154. These offices employ 3,680 men, and cost the Government during the year $3,173,336. The amount appropriated for the service was $3,200,000.

The Secretary of the Navy on October 10 wrote to Commander Wildes, of the *Yantic*, asking for explanations of his course in the recent Greely Relief Expedition. Among the explanations asked was the following: "You were at Littleton Island on August 3, and learned that the *Proteus* had been crushed, and that Lieutenant Garlington and his whole party had gone south, leaving nothing for Greely at Littleton Island. You could have readily landed there provisions and supplies, but omitted to do so. You will please explain this omission." Commander Wildes, in his reply, says: "On learning of the loss of the *Proteus*, I considered my first and paramount duty was to pick up the boats which contained thirty-seven men. Having done that, it would be time to consider what next." He adds that ice-packs prevented his carrying out the programme, and carefully explains each move made by him. It is said that the Secretary of War is by no means satisfied with Lieutenant Garlington's defence of his conduct of the expedition, and an official investigation is likely to be ordered.

The Signal Service contemplates a project to announce weather predictions by displaying signals on railway trains in the rural districts.

The Secretary of State, Mr. Frelinghuysen, has addressed a letter to the Civil-Service Commission, outlining a plan of examination for the offices in his department which come under the civil service law.

Mr. Dorman B. Eaton, of the Civil-Service Commission, has expressed himself as opposed to a system of competitive examinations for promotions. It is known that another member of the Commission is equally strenuous in his objections, so that a majority of the Commission is against it.

One result of President Arthur's visit to the Northwest is said to be a determination to appoint only residents of Territories to the important Territorial offices. The people of the Territories are dissatisfied with appointments from without.

Mr. J. W. Niles, of Arkansas, who advocates "separation" for the colored people, has received from Attorney-General Brewster an answer to his communication, addressed to the President, alleging that the colored people of Arkansas were suffering certain grievances at the hands not only of private persons, but of the civil authorities. In his reply the Attorney-General points out that the grievances complained of come entirely within the jurisdiction of the State and not of United States authority. Mr. Niles has written, as a result, an address to the negroes, asserting that their only salvation as a people is to prepare to leave the country and "found a civilization in some congenial clime."

Vice-President Hoxie, of the International Railroad, has written to Governor Ireland, of Texas, that business will not justify the running of separate coaches for the negro. Under the recent civil-rights decision, he says, "we can now make colored men take the seats we desire." The Governor, in reply, strongly advocates different coaches for blacks and whites.

A call for a convention of colored people of Georgia in Atlanta on December 12 has been issued, signed by all the leading colored men of the State. The call declares that the condition of the colored people of the State is growing worse.

The Republican leaders of Boston, on Tuesday afternoon, held a meeting at which it was decided to appoint a vigilance committee to prevent fraud on election day through the election officers recently appointed by the Mayor in Butler's favor. Seven hundred reputable gentlemen, many of them heavy business men, have pledged themselves to visit the 107 polling places in Boston on the 6th of November, and guard the ballot-box from fraud. Persons of doubtful character will be challenged, and all possible precautions taken to prevent fraud.

The Massachusetts Democratic State Committee on Saturday substituted the name of S. A. B. Abbott for that of Frederick A. Prince (declined) on the Butler ticket as candidate for Lieutenant-Governor.

Tammany, Irving Hall, and the County Democracy, in this city, have harmonized, and, in accordance with the terms of the compromise, have nominated a ticket composed of representatives of each division of the party.

At a meeting of the Citizens' Committee in this city on Thursday letters were read from three of the candidates nominated by them, declining to serve. A report from the Executive Council was read and unanimously adopted, recommending that the effort to elect a Citizens' ticket be abandoned on account of the failure of the Council to arrange with the Republican Committee for a joint ticket. They also reported that they failed to see much general interest in the movement. The meeting was then dissolved. The Republican Conference Committee on the same evening determined to recommend to the County Convention the nomination of a straight ticket, and on Friday evening the nominations were made.

The Republican City Convention, of Brooklyn, on Wednesday evening approved of the non-partisan administration of Mayor Low, and renominated him by acclamation. The Democrats have made a nomination.

In the Sessions bribery trial at Albany, on Wednesday, ex-Senator Sessions testified in his own behalf. He emphatically denied that he had given Mr. Bradley any money for his vote. On Thursday the jury rendered a verdict of acquittal. The judge's charge was criticised as being too much in favor of the prisoner.

The centennial anniversary of the disbanding of the Revolutionary army by Washington was celebrated at Newburgh, N. Y., on Thursday, with great ceremony. There was a fine procession, an oration by William M. Evarts, a poem by Wallace Bruce, and other interesting exercises.

The amendments to the medical code were defeated at a crowded meeting of the Academy of Medicine of this city on Thursday evening. The meeting was very excited, and the amendments received 121 votes out of 213. A three-fourths majority was necessary to carry them. A motion was then passed rescinding the resolutions offered by Doctor Flint on April 19, 1883, one of which provides that no physician opposed to the code recognized by the American Medical Association be admitted to fellowship in the Academy. At a meeting of the County Medical Society on Monday evening, the new-code men succeeded in electing their ticket of officers.

A report is current in Salt Lake City that John Taylor intends to resign the presidency of the Mormon Church on account of his advanced age and feeble condition. George Q. Cannon, it is believed, would be his successor.

In Philadelphia the General Convention of the Protestant Episcopal Church still remains in session.

The Rev. H. C. Potter, D.D., was consecrated Assistant Bishop of New York in Grace Church, in this city, on Saturday morning. The ceremonies were impressive. Bishop Williams, of Connecticut, preached the sermon. Bishop Benjamin Bosworth Smith, who is nearly ninety years old, performed the consecration ceremony. About 350 clergymen of the diocese of New York, and 100 visiting clergymen, were present.

A reception was given to Lord Chief-Justice Coleridge on Tuesday evening by the Bar Association of this city. It was social and conversational, without speech-making. The invitations were limited to members of the Association, to eminent lawyers living out of the city, and to judges of the courts of this and other States and the United States.

Mr. Henry Irving and Miss Ellen Terry, the English actors, arrived in this country on Sunday morning. They were met down the bay by Mr. W. J. Florence and Mr. Lawrence Barrett with the steam yacht *Yosemite*. Mr. Matthew Arnold, the eminent English poet and critic, arrived in this city on Monday. He will deliver a series of lectures throughout the United States.

The Metropolitan Opera-house of this city was opened on Monday evening with a performance of "Faust." Nilsson and Campanini appeared. The occasion was a social but not entirely an artistic success. The opera season at the Academy of Music was opened on the same evening. Mme. Gerster made her reappearance.

The National Horse Show was opened in the Madison Square Garden, in this city, on Monday morning. A large number of famous horses are on exhibition.

The father of Charley Ross has been in St Louis following up another clue to the whereabouts of his child. The boy is said to be in Illinois with a family of negroes. It has just been revealed that a brother of Mosher, who was implicated in the abduction, was lynched in Wyoming several weeks ago. He said that he could give information in regard to a widely-known crime if the lynchers would give him time, but he was denied the privilege.

A serious accident occurred at the Harvard College boat-house on Saturday. The piazza in front of it was crowded with 100 students and their friends waiting for the start in the fall races between the college crews. Suddenly it gave way and precipitated them into the water below. Fortunately the tide was low and nobody was drowned. Twelve persons were injured, several of them seriously.

FOREIGN.

At the English Liberal Conference in Leeds, on Wednesday, Mr. John Morley, the presiding officer, expressed a strong opinion that the Government should bring in the County Franchise Bill at the next session of Parliament, because the whole Liberal party of the House of Commons, excepting, perhaps, Mr. Goschen, was united in believing that the question could no longer be delayed. If the House of Lords raised an objection to the measure, it would be very dangerous for them. Dr. Dale moved a resolution, which was carried, asserting that it is the duty of the Government to introduce a bill dealing with the county franchise at the next session of Parliament. A motion that any measure for the extension of suffrage should confer the elective franchise upon women fit to vote, was also carried. At the session on Thursday, resolutions were adopted in favor of the redistribution of seats in Parliament; condemning the action of the House of Commons in refusing to allow Mr. Bradlaugh to take his seat therein; and favoring the abolition of Parliamentary oaths, as well as the shortening of the period of time required for the qualification of voters. The Conference then adjourned after a very harmonious session.

A public meeting of the Liberals was held in the Town Hall in the evening. Mr. John Bright presided, and made a speech, in which he said that it was absolutely necessary, if any progress was to be made on the question of Parliamentary reform, that the question of suffrage be dealt with first in a separate bill. He recommended that the Government deal during the coming session with County Suffrage and the London Corporation Reform Bills. He expressed the opinion that a question soon to be met was the reconciliation of the two houses of Parliament, both to be made equally responsive to the national wants.

Sir Stafford Northcote is making a tour of Wales and addressing assemblages of voters.

An indictment charging O'Donnell with the murder of James Carey was brought into court in London on Wednesday by the Grand Jury. O'Donnell pleaded "Not guilty." At the request of counsel his trial was postponed until November 21.

General Pryor, O'Donnell's American counsel, in an interview in London, said he was satisfied that O'Donnell killed Carey in self-defence. He said it would be proved beyond question at the trial that O'Donnell went to Africa with no design of killing Carey, and was unaware of the latter's presence on board the steamer when he embarked.

Mr. Moody has been annoyed in his revival meetings at Cork, Ireland, by ruffians who make a disturbance outside of the hall. He is now saved from further interference by the police.

Mr. Lowell, the United States Minister to Great Britain, will be nominated a candidate for the rectorship of the Scotch University of St. Andrews.

Mr. J. W. Mackey and Mr. James Gordon Bennett signed a contract on September 28 with Messrs. Siemens Brothers for two transatlantic cables, which are already in process of construction at the works of Messrs. Siemens Brothers, near London. The first cable will be open to the public about June 1.

The Cambridgeshire Stakes were won at the Newmarket races, in England, on Tuesday, by H. T. Barclay's colt Bendigo.

An explosion in a Yorkshire (England) colliery on Thursday night killed twenty miners who were in the pit.

Capt. Mayne Reid, the novelist and traveller, died at his residence in London on Sunday night, at the age of sixty-five. He was a native of the North of Ireland, but when twenty years of age his love of adventure led him to this country, where he began life as a trader in New Orleans. He made long journeys into the interior of this country, and became well acquainted with Indian life, which furnished him with subjects for his novels. Among the best known of his stories are 'The White Chief' and 'Afloat in the Forest.'

The Paris *Temps* denies that the French Government has arrived at any decision regarding the amount of indemnity to be paid to Mr. Shaw, the English missionary.

The Paris *Figaro*, on Tuesday, asserted that England had sent a note to France complaining of the prolonged occupation of Tamatave, to the injury of commercial interests.

General Campenon, French Minister of War, will, it is said, devote all his energy to reforming the system of mobilizing the army. The prospect of a war with Germany appears, it is rumored, to be uppermost in his mind.

The French Senate and Chamber of Deputies reassembled on Tuesday. M. Tirard introduced his draft of the budget, although it had been severely criticised and rejected by the Budget Committee, because, while affecting to show an equilibrium, it really shows a deficit of 65,000,000 francs. It is rumored that M. Tirard will resign from the Ministry.

On the same day the Yellow Book was issued. It recounts the operations of the French forces in Tonquin, and says their position in that country has materially improved. They now can move freely to all parts of the Red River delta and hold all the strategic points in that territory. The Mandarins who still resist the French authority will be removed by envoys of the King of Anam, and the people are regaining confidence. The Anamite troops have been disbanded, and the Black Flags have retreated from their positions. The French army now only awaits reinforcements to complete the pacification of the country. The book also gives at length the details of the negotiations with China, which have been conducted, it says, in good temper on both sides. China indicates her willingness to come to terms, but declines to accede to the demands of France.

In concluding the details of the negotiations the Yellow Book says that on August 18 the Government of China submitted proposals involving the evacuation of Tonquin by the French troops, the maintenance of the suzerainty of China over the territory, and the opening of certain towns to the benefits of trade. These proposals were rejected. A counter proposal was submitted by France on September 15 for a neutral zone between China and Tonquin. This proposition was declined by China on October 16, that Government declaring that she would accept a neutral zone only on the southern instead of upon the northern frontier of Tonquin; while, it was stated, she was also willing to make arrangements for the opening of the Red River delta to trade. The account concludes: "Thus China demands the whole of northern Anam and the French evacuation thereof, allowing us only the southern provinces. There is no doubt that the arrival of the reinforcement expedition will promptly terminate the work so gallantly begun in Tonquin. France is still ready to negotiate with China in a friendly spirit."

Lieutenant Viard, who was the author of the report printed in the Paris *Figaro* that the French sailors massacred the natives at Hué, has been removed from active service. The report is officially declared to be false.

Reports concerning an approaching war with foreigners are circulating in the interior of China, and the people in Yunnan believe that the Chinese army is preparing to wage a war of extermination against all foreigners. The Viceroy of Canton objects to foreigners traversing the streets of the city. He has 10,000 men concentrated in the neighborhood of Canton, ostensibly on account of anticipated popular commotion, but doubtless really in readiness to resist an expected French attack. A decisive action of the French forces from Hanoi against the Black Flags at Bacninh is impending.

The Paris *Gaulois* announces that Prince Jerome Napoleon is determined to publish a political manifesto.

The Duc de Fernan-Nuñez insists upon withdrawing from the Spanish Embassy at Paris despite the urgent representations made to him by the Spanish Cabinet, which has hitherto refused to accept his resignation. Meanwhile he has obtained two months' leave of absence and will quit France immediately.

The Spanish Cabinet has resolved to summon the Cortes to meet on December 1. A royal decree has been issued providing that henceforth general officers shall hold staff appointments for only three years.

The circular of General Lopez-Dominguez, Spanish Minister of War, to the Captains-General of the army, was officially published in Madrid on Friday. The War Minister dwells on the great necessity for extensive army reforms, and asks the army to rally round the King. He expresses the hope that the Captains-General will coöperate with him in perfecting the organization and discipline of the army, by which they will earn the gratitude of their country, and inspire foreign nations with respect for Spain. The Spanish Minister of Finance and the Minister of Foreign Affairs on Friday received the delegates of the Tariff Reform Society. The former said to the delegation that he hoped to be able to introduce all the financial reforms that the country required. The Foreign Minister said he would do his utmost to conclude treaties of commerce between Spain and all other nations.

Three shocks of earthquake in quick succession were felt at Gibraltar soon after Friday midnight, and another at 2 o'clock on Saturday morning.

A series of earthquakes on the peninsula between Tchesme in Asia Minor, opposite the island of Chios, and Vurla, on the southern coast of the Gulf of Smyrna, has destroyed many villages in that region. It was believed that about 1,000 lives were lost on the mainland, but later reports reduce the number to about 200. There is great suffering among the survivors. The Porte has issued a notice stating that 20,000 persons are homeless and pleading for immediate assistance. Chios and other islands of the Grecian Archipelago were visited by the earthquake. The Grecian Government has sent two men-of-war with supplies for the sufferers to the scene of the disaster.

The corner-stone of the church which is to be erected upon the spot where Emperor Alexander II. was killed, was laid on Thursday in St. Petersburg by the Czar and Czarina, with imposing ceremonies, in the presence of the court officials, the nobility, and a vast concourse of people.

A recent number of the Socialist paper, *Will of the People*, which has been distributed in St. Petersburg, contains a letter from the Nihilist prisoner Netchazheff to the Czar. Netchazheff was condemned ten years ago, and was supposed to be dead. The writer complains of the inhumanity of the prison officials, and of the terrible treatment to which he and his fellow-prisoners are subjected. The original letter was written in blood. It has created a sensation in St. Petersburg.

The Vatican is arranging a convention with Prussia providing for the improvement of the relations between that country and the Holy See, and for the restoration to their dioceses of those bishops who have been expelled from the country.

A crisis occurred in the Portuguese Cabinet on Sunday, owing to troubles connected with the approaching municipal elections. The Ministers of the Interior and Marine resigned. On Monday a new Cabinet was announced. It was further modified on Tuesday.

A farewell ball was given by the citizens of Quebec, on Friday night, to the Marquis of Lorne and the Princess Louise.

Lord Lansdowne, the new Governor-General of Canada, arrived at Quebec on Monday night. There were disturbing rumors afloat during Sunday and Monday of Fenian plots to murder him, but no foundation in fact has been revealed. He did not land from the steamer until Tuesday morning, when he received the oath of office with great ceremony, and delivered a speech in reply to an address of welcome.

Two suspicious characters were arrested in Halifax, N. S., on Wednesday evening. In their baggage were found a number of dynamite cartridges and other explosives. It is supposed that they are Irish-Americans who are in a plot to destroy the public buildings in Halifax.

It was announced in Lima, Peru, on Sunday, that a treaty of peace had been signed on Saturday night at Ancon between the Chilian Government and General Iglesias.

At 8 A. M. on Tuesday General Lynch and the Chilian troops left Lima for Barranco, near Chorillos, where he established his "general cuartel." At 10 A. M. General Iglesias entered Lima as "Presidente Regenerador."

Order has been completely restored at Port-au-Prince, Hayti. Fifteen hundred lives were lost and damage to the extent of $4,000,000 was done during the recent massacre.

CHEAP NEWSPAPERS.

THE *Pall Mall Gazette*, speaking the other day of the change in the price of the *Herald* and *Times* of this city, characterized it as one of the signs of the tendency of the prices of all newspapers to a minimum, newspapers being now the one commodity which never rises. It is quite true that enormous pecuniary successes in cheap journalism have been achieved, particularly in England, where the penny *Telegraph* and *Daily News* are among the most valuable properties in the world. The *Figaro* and one or two others have obtained a similar success in France, though at a higher price. But, nevertheless, there is some reason for believing that the experiment of very cheap newspapers has not yet been fully tried. It never will be fully tried until there are more of them—or, in other words, until the competition among them becomes keener. The *Daily News* and *Telegraph* owe their great circulation largely to the fact that they were the first metropolitan newspapers to be sold for a penny. They thus at once got hold of the very large public which had been contenting itself with borrowing the *Times* at a penny an hour, or taking it later in the day at half-price. To this class a newspaper, with all the news, which they could become possessed of every day early in the morning for a penny, seemed, and really was, a great luxury. The first members of the penny press profited, moreover, by the first results of increasing popular education and the extension of the suffrage. In truth, they found a new field, which they at once occupied. The question still remains to be decided how large a field it is—that is, how many penny papers it can accommodate.

Much of the talk about the future of the cheap press is based on the notion that the demand for newspapers is practically unlimited. It is really nothing of the sort. In England and other countries in which popular education is only just beginning to tell on the number of readers, the demand for them for a few years to come will doubtless increase, but even there the limit cannot be very far off. For newspapers, if they differ from most other commodities in the fact that, as far as we have yet seen, their price always tends to a minimum, differ also in the fact that hardly anybody wants more of them as he grows richer. This is not true of any other article of daily use. As a man's wealth increases he generally buys more tea, coffee, sugar, cotton, and linen, and horses and carriages, carpets, wine, clothing, and so forth. But nobody spends more on newspapers when his circumstances improve. The rich man does not take five dailies where the poor man takes only one. Almost everybody reads one or two newspapers a day; very few read more than two, or can be got to read them by any inducement whatever. A man is often induced to subscribe for them by the "special inducements," such as chromos and other "premiums." But it is rare for a man to read a paper which comes to him in this way, or to remain a subscriber to it longer than the "premium" made necessary. It may, indeed, be laid down as a rule that the circulation of the daily press increases with the population and not the wealth of the country, which cannot be said of any other object of daily consumption.

Nor is there any other article so widely used the price of which is so near the minimum. One of the great difficulties of the two-cent press is, or rather will be when competition becomes sharper and begins to press more closely on the limits of expansion, that the price is literally a "bottom price." All other dealers have room to come down, if they are willing to make sacrifices to ruin a rival, but to the two-cent press only one-cent reduction is possible. For less than one cent it would not be possible to sell a paper in any country in the world, because nobody will take newspapers, like apples, two for a cent, or three for two cents. There are only two resources left, therefore, when competition becomes very keen—one is to increase the size of the paper, by way of giving the buyer more for his money. But the publisher who attempts this every day by way of outdoing his competitors really repudiates the two-cent idea. The two-cent idea is that the newspaper reader wants something very light and short for his daily reading; that he is repelled by many pages, or many articles, or long articles. He desires something neat, compact, and condensed. In so far as the paper is enlarged, however, this idea is departed from. The ordinary newspaper buyer does not want as much matter as there is in a monthly or quarterly magazine furnished to him every day. An attempt to furnish him with it on week days would probably disgust, repel, or weary him. In other words, it will never do to publish a Sunday paper on Monday, Tuesday, and Wednesday.

The other resource is to change the character of the contents; and it is in this direction, as far as we can see, that the competition between the cheap papers is likely to run after the bottom price has been reached. Each will try to furnish for the cent more of the kind of matter which he thinks one-cent readers like; and, as far as we can judge from observation, what he thinks they like is less attention to the quality of the news and more to the quantity of it; plenty of scandalous and criminal intelligence; lighter and more flippant discussion of the news, and much ferocious personality. The two-cent papers have not, by any means, all begun to furnish this, but anybody who observes a cheap press closely will find that the tendency in this direction is strong and steady, and makes perceptible progress. In other words, he will find in it many signs of contempt for the two-cent public, a low view of its tastes and standards, both moral, intellectual, and political, and a cynical readiness to meet them. One of the most marked features in this tendency is a disposition to drop all expensive matter from the paper, such as accurate news, and substitute bogus despatches and small jokes. Small jokes probably cost less than any kind of reading; they are consequently much in demand in the cheap press. In Paris, the press of which is worth studying as an example of the form which cheap journalism is not unlikely to take, should the competition continue to grow, daily papers are frequently started which only appear for two or three days, the capital of the proprietors being exhausted within that period. The contents consist almost wholly of small scurrilous jokes and scandalous anecdotes, and the office is probably in a café.

The truth is, that the apostles of the cheap press enormously exaggerate the newspaper-reading capacity of mankind, and their expectations about its future are probably wildly extravagant. In fact, we are likely, during the next twenty-five years, to see the production of newspapers greatly overdone, like production in some other articles which have no foreign outlet. Newspapers cannot be forced on the community any more than blankets without a heavy reduction in price; and the press now, as we have said, has hardly any room for reduction without becoming waste paper. Few need more than one newspaper, and one cannot, do his best, spend more than a certain time in reading it. It is not at all improbable, too, that the supply of newspaper humor and scurrility may be found during the same period greater than the market will bear. There are signs already that it has begun to pall on the public, and that a reaction against it is among the possibilities of the near future. Men tire of everything of which they get plenty, sooner or later. Even drunkards are said to be made to loathe whiskey by having all their food saturated with it. The two-cent and one-cent people are in fact not at all unlikely to turn on their purveyors and rend them for taking too low a view of their taste and capacity.

THE HORSE SHOW.

IT is at first sight somewhat surprising that the National Horse Show which opened on Monday should be the first of its kind in the United States, considering the long standing and great success of similar exhibitions in England, and the strong love of horseflesh which is one of the American characteristics. One reason of this is, that the country is so large, and distances, therefore, so great, and the means of horse transportation hitherto so imperfect, that a really representative collection of American horses has been almost impossible. Another is, that the attention of breeders—at the North, at least—has been hitherto almost exclusively devoted to trotters, and trotters are in most cases not much to look at, and trotting courses and trotting matches are very common all over the country; so that a show of trotters, most of which would of course have only an ordinary record, would not be a supremely attractive spectacle for horse lovers.

Within a few years, however, the condition of the horse world has greatly changed. Communication has been greatly improved and cheapened. Much greater variety has been introduced into the breeding. We are now beginning to breed good carriage, saddle, and cart horses, as well as trotters, in various parts of the country. The wonder is we did not begin sooner. A good part of the disrepute into which horse-breeding has fallen as a remunerative business has been due to its being so much confined to thoroughbreds for racing purposes and trotters. Nobody who is not prepared to lose money, and plenty of it, can en-

gage in the raising of either of these; and, as a matter of fact, it has been rather the amusement of rich sporting men than the regular occupation of men who want a fair profit on their capital. The reason is, that a thoroughbred or trotter which cannot take his place among the 50 or 100 fastest horses in the country, is good for very little. A slow thoroughbred is, in fact, a very nearly worthless animal, unless in the very cases in which he has an abnormal amount of bone and sinew. In these he makes an excellent saddle horse, but only for a light weight and good rider; or an excellent harness horse for light vehicles, but only for a good driver—for his temper is exceedingly uncertain and his nerves generally in a condition of excitability. But powerful thoroughbreds are few in number. Those one sees under the saddle here are very apt to be the refuse of racing stables—weedy brutes, of which their riders are afraid, and which owe most of their value to their pedigree, that ought to be simply a feather in a good horse's bridle, but which many people accept as a substitute for wind, and bottom, and power, and gentleness, and beauty. The same thing is true, with a few changes, of the trotting horse. If he does not show signs at three years old of being able to get down below 2·30, he nowadays brings only the price of the most ordinary roadster. He has rarely weight enough to be of much use either as a saddle or draught horse, and, indeed, a horse trained for trotting speed in harness can rarely be converted into a good saddle horse. His mouth and girth are apt to be spoilt for riding purposes.

The general result of this state of things has been to give horse-breeding on a large scale the character either of amusement or gambling. Few have attempted it heretofore without a long purse, and even those who attempt it with a long purse are apt to get very sick of it before many years. Most of our breeding for ordinary purposes at the North has, in fact, been done by farmers, out of old mares that have gone lame or are past their work, and with but little attention to points, and little thought of any excellence except trotting speed. Few good saddle horses, up to anything but the lightest weight, have until lately been bred at the North, and perhaps still fewer good carriage horses. It is only within a very few years that short-backed, cob-built horses, with power in the shoulders and quarters, equal to heavy weight in the saddle or on wheels, have begun to show themselves in the market. And yet for such horses there is now a practically unlimited demand, both here and in England. The breeding of them offers really all the advantages of a steady and lucrative business to anybody who understands horse-breeding, because there need be none, or but little, of the uncertainty about it which marks the breeding of thoroughbreds or trotters, in which a man may readily produce 500 two-year-olds without getting one that will win a race or make a mile in 2·20.

A saddle or carriage horse, on the other hand, does not need to display extraordinary speed to bring a good price in the market. If he is good-looking, powerful, good-tempered, sound, and can trot twelve miles an hour, he is a valuable horse, and is sure to be snapped up either in any of our cities or in Liverpool or London. A good breeder need have no difficulty in producing such horses every year by the score. The taste for the saddle, which is happily spreading at the North, makes the demand for good saddle horses now practically unlimited, and has totally changed the popular notion about the nature of a saddle horse. The farmer's and livery-stable-keeper's idea of a saddle horse in this part of the country has been, until lately, a horse that would not go in harness at all, or was very slow, or unsound—a horse, in other words, which was of but little use for any real work. The growing demand for saddle horses, however, by people willing to pay good prices for them, has brought them in great numbers from the South, mainly from Virginia and Kentucky, and has done a good deal to open Northern eyes to the fact that the good saddle horse is the highest type of horse, and that the first question to ask about a horse you want for harness is whether he would carry a man well on his back. If he can do this, he is good for anything, because to do it he needs not only ordinary soundness, but power everywhere, and, in addition to power, good temper, docility, courage, and thorough command of his limbs. A horse may go very well in harness long after his knees or his back has weakened, or his eyes have begun to fail him; but to make him safe in the saddle, he must be sound as a bell, and strong—able, in short, to go anywhere and do anything. A saddle horse is, in fact, the ideal horse, and has been so in all the great horse countries since the Shepherd Kings began to breed him in Upper Egypt.

Somebody who did not know well what he was talking about, has lately sneered in the press at the managers of the coming show, for making "hunters" a class to themselves, as something un-American, and therefore ridiculous. The young men who have introduced hunters into this part of the country, by getting up fox and anise-seed-bag chases, have perhaps their laughable side, but their absurdities or affectations must not blind us to the fact that in introducing the hunter they have introduced what is really, for all purposes except speed or heavy draught, the best horse in the world, and the horse which every American breeder ought to cultivate. The hunter is simply a horse that jumps well, and that gallops hard and long with a heavy weight on his back. This means a horse of great pluck, power, bottom, and agility, or, in other words, the most valuable kind of horse a man can have. That his great qualities are used for a purpose which many people think absurd, is nothing against him. He is still the best horse one can put into a carriage or wagon—supposing him to be, as all good hunters are, half or three-quarter bred—and the best horse man or woman can mount. A hunter's goodness includes all kinds of goodness. In fact, there is no situation in which all a horse's powers are so brought out as in flying across country. A horse that can do this well can do anything. Those who wish to improve the breed of horses in America, therefore, do well to encourage the hunters, and can do so with perfectly good conscience, even if some people use them in ways which some think silly. There is every reason to believe that the show will be one of the most interesting spectacles we have ever had in this city, and that it will reveal for the first time the very great progress which has been lately made by American dealers and breeders in supplying horses for real work, both for saddle, harness, and heavy draught.

THE ENGLISH RADICALS AND MINORITY REPRESENTATION.

The representation of minorities occupied much of the attention of political philosophers twenty-five years ago, and some experiments in the application of it on a small scale have been made in this country and in England, to say nothing now of more elaborate experiments elsewhere. The idea of minority representation is, of course, to get a fairer and more correct expression of public opinion than can be obtained when simple majorities elect. The motive for minority representation is dissatisfaction with majority rule. But majority rule is the practical principle of democracy, as political equality is its dogmatic basis. Minority representation is, therefore, a limitation on democracy, just as representative institutions are a limitation on monarchy, or the restriction of taxing powers to the Commons a limitation on aristocracy. Experience shows that no depositary of political power chafes against restraints more impatiently than a Democratic majority.

So far as we have learned, the experiments in minority representation have not succeeded in arousing anybody's enthusiasm. The interest in them has declined. The hopes of better political organization—especially of the modification of the evils, without loss of the benefits, of party government—have been disappointed. No body of men have come to regard minority representation as a guarantee of important rights or a protection of great interests. Therefore, if the institution is attacked, few will rally to its defence. It has certainly never won popularity with the mass. It runs counter to their prejudices and to the set of their political habits and opinions. We have heard a popular meeting instruct a committee to secure a change of law "so that we can vote for these officers as we do for others." The politicians have never liked the device. They always work for victory, and minority representation seems to them only to curtail the profits of a victory when it has been won.

The English Liberals, at their recent conference, passed a resolution condemning minority representation as hostile to "popular representative institutions." It is, no doubt, the voice of politicians or political leaders which is heard here. The point which interests us, however, is not that they have now thrown over a device which was very popular with the advanced thinkers twenty years ago, but that the reason which they give shows what advanced thinking is to-day. Is minority representation hostile to popular representative institutions, or have we here another instance of the old political device of false identification? Minority representation is hostile to majority rule, but is majority rule

to be identified completely and directly with popular representative institutions? It certainly is not. It is easy to win popular effect, and to establish a prejudice, by such an unexpressed and false identification, but it is a very mischievous error and a capital illustration of the danger of loose thinking in politics.

If it is possible to adopt institutions which can properly be called popular and representative, then we have such in this country, but majority rule has never been raised here to the rank of a political dogma, or regarded as anything more than a convenient but very imperfect device for reaching certain ends. If we try to use majority rule as a "principle," the women immediately confront us with the first question: "Majority of whom?" Connecticut still has a borough representation. In the representative systems of our States and the Union, we are familiar with the fact that majority rule is violated over and over again by the district system. In electing a President we use an institution—the Electoral College—which has given us a minority President several times. The legislation of Congress is controlled, through the rules of order, by a two-thirds vote, and not by a simple majority. In case of a veto a similar vote is necessary to enact a law, and a successful veto is the most striking violation possible of majority rule. An amendment to the Constitution can only be adopted by a two-thirds vote of both houses, together with the assent of three-quarters of the States. In all these cases the obvious intention of the Constitution-makers was to give a minority, of a certain proportionate magnitude, power to arrest action, and the motive of violating majority rule was to secure rights in certain very important and delicate cases more perfectly than could be done by majority rule—perhaps even to protect rights against the majority itself. Undoubtedly popular opinion has elevated majority rule to the sanctity of a "great principle of free government," but we have had frequent and abundant occasion to rejoice that our institutions have never been moulded or controlled by a determination to fill out a political phrase or the dogmatic description of a pet device to the full measure of a literal realization. We have had a great deal of political dogmatizing and declamation, but in fact and practice we have lived under a practical working system which aims to guarantee rights whether it satisfies the political speculators or not. We regard majority rule not as an end, but as a means. The only end we acknowledge is good government. If we can attain this better by majority rule than otherwise, we employ that means. If we can attain the end better by some modification of majority rule, we do not hesitate to adopt the modification. Even "popular representative institutions," which, as we have seen, cannot, without grave error, be confounded with majority rule, owe all their claim to our respect to the fact that they guarantee good government better than any other political arrangements which have yet been devised. Therefore it by no means suffices for the condemnation of any political device to declare that it is hostile to popular representative institutions, even when such institutions are correctly defined. It would yet remain to inquire whether the new device might not be a valuable improvement, tending to a more complete realization of good government.

It is very possible that minority representation, when tested on its merits by the experiment, has not proved to be a valuable improvement. If so, it will pass away. No interest will attach to it. It will cost no regret. It is, however, of the first importance that our political thinking be careful and correct, especially when it turns about popular phrases and current notions. The distinction which we have been noticing is no less than that between the development of political systems by considerations of expediency or in accordance with absolute dogmas. The English radicals seem to be tending toward the latter method, which has been going out of fashion in this country during the present generation. It would be a great misfortune for us if it should be revived by one of those reflex influences from the other side of the water with which we are familiar.

THE METROPOLITAN OPERA-HOUSE.

"Faust" was a good work to choose for the opening night of the new Opera-house. It contains a greater variety of vocal and orchestral effects than any one of the popular Italian operas (except "Aïda" and "Mefistofele"), and it therefore enabled the audience to form an estimate of the acoustic qualities of the house, while at the same time it contains a sufficient number of arias to please those whose only desire is to hear the vocalists display their accomplishments. There are many points of interest to be considered in connection with Monday evening's performance—the return of several favorite singers, the appearance of the new house, the attitude of the audience, the new conductor, with his chorus and orchestra, and the musical qualities of the auditorium. But all these points are logically overshadowed by the question how it is that a number of wealthy people can combine and spend $2,000,000 in erecting one of the largest and most sumptuous opera-houses in the world, fitting it up with costly and elaborate scenery, securing some of the most high-priced and highly-prized artists, with a most "brilliant" audience to witness their efforts, and then allow the first night to end in disappointment on account of slovenly stage-management. There was an excuse for beginning half an hour after the appointed time, because the throng of carriages was so great that it was impossible for the 3,000 people unacquainted with the arrangements of the auditorium to reach their seats any sooner. But there was no excuse for having an intermission of nearly half an hour between the acts, thus protracting the performance till nearly 1 o'clock. By that time a large proportion of the spectators had left the house, while those who had remained to the end were hardly in the physical condition to enjoy properly the fine music of the last two acts. If the scene-shifters were unable to do their work in less time, they should have had a greater number of rehearsals or less elaborate scenery to deal with. The consequence of this mismanagement was that everybody felt bored, and this was a bad omen for such an occasion.

The first of the singers who made his appearance was Signor Campanini. He had the good taste not to acknowledge the ill-timed applause with which he was greeted, at the expense of a fine orchestral passage; and if he had had the tact to ignore likewise the gigantic bouquets with which he and Mme. Nilsson were overloaded, he would deserve an additional compliment. An opera-house is not a flower market, nor a tenor a dray-horse. Campanini's voice has not entirely recovered from the effects of over-use, which were so conspicuous before he left us a year ago. Occasionally his high notes gave evidence of effort, but in some of the cantabile passages his voice was as clear and sweet as of old. His favorite mezza-voce effects, which are so much admired by some, are lost in the vast space of the auditorium. Mme. Nilsson's *Marguerite* was a charming picture of the artless German maiden, and her acting gained interest through many well-studied realistic details, while her voice proved to be the same as last year—rich, pure, mellow, flexible, and expressive. The "jewel" song has been sung heretofore with greater spontaneity and ease by Mme. Patti, and by Mme. Nilsson too. Mme. Scalchi's voice pervaded the house better than any other, and she secured warm applause and an encore. Mlle. Lablache took the part of *Marta* at short notice, Mme. Lablache having been prevented from appearing by the terms of her contract with Mr. Mapleson. Her efforts were satisfactory, as was also Signor Del Puente's acting and singing. Signor Novara's voice seemed to be completely lost in the vast auditorium, and his acting, which was otherwise praiseworthy, was somewhat too exaggerated. Precision and good quality of tone characterized the ensemble numbers, which seems to indicate that the chorus consists of good material. The scenery presented some admirable details—as, for instance, the cathedral in the background of the second act, the vision of *Marguerite*, and the various retorts, skeletons, and other paraphernalia of *Faust's* study-room.

If the undeniably fine cast which was employed on Monday did not produce so favorable an impression as had been anticipated, this must be in part ascribed to the fact that the vocalists were as yet unaccustomed to their surroundings, and also apparently to the acoustic defects of the house. We say apparently, because it is impossible to pronounce an absolute judgment after hearing a single opera from one part of the house. So much, however, seems to be clear: that only the strongest voices have any opportunity of asserting themselves, and that even they will have to make a constant effort, which in the long run will prove detrimental to them. Florid Italian operas, with their simple guitar accompaniments, are not suited for such a place; but if this should speed their departure from the repertory, we should be the last to complain. There is, however, a class of works, like the comic operas of Mozart and Auber, which must be preserved; and for these another home must be found—which suggests the possibility of the co-existence of two opera-houses, provided a proper division of labor is made, instead of both managers harping on the same tune. We only fear that the auditorium of the Metropolitan Opera-house is too large even for grand opera. The projectors have been carried too far by the American craving for having the largest of its kind in the world. There is a limit to the size of a hall in which music can be properly enjoyed. Superb effects were indeed produced at Mr. Thomas's May Festival in the immense Seventh Regiment Armory, but this was done by augmenting the orchestra to just four times the size of that presided over by Signor Vianesi. Sound, of course, can be heard at a greater distance than the top gallery of the new house, but, as Berlioz says, the "musical fluid," or the unknown cause of musical emotion, is without force, warmth, or vitality at a certain distance from its point of departure,

The hearer must "vibrate" with the instruments and voices to be deeply moved, and we must confess, for our part, that on Monday evening we did not "vibrate." We were bored.

In justice to the architect, it must be stated that the conditions under which "Faust" was heard on this occasion were not in every respect those intended by him. He had followed Wagner's excellent plan (already suggested by Goethe and Grétry) of lowering the orchestra so as to place the scraping and blowing musicians out of sight of the audience, and give the vocalists, in contending with the orchestra, a better chance of sending their notes with unabated force to the ears of the spectators, and enable them to understand the words of the text. But Signor Vianesi objected to this arrangement, and the orchestra was raised almost to a level with the parquet. It is to be hoped that this arrangement is only temporary, and that when "Lohengrin" or one of Meyerbeer's operas is given, the orchestra will be put again in the place assigned to it by the architect, so as to give the critics and the public an opportunity to test the justifiableness of Signor Vianesi's arbitrary proceeding. In one other respect the architect deserves credit, for following, at least partially, the precedent of the Wagner Theatre at Bayreuth. There the auditorium is completely separated from the stage by an "abyss" which produces a stereoscopic effect and greatly adds to the illusion. This abyss Mr. Cady has not introduced, but he has, at any rate, refrained from building his proscenium boxes right up to the stage, and this is a great advantage to those in the audience who care more for the artistic aspect of opera than for the social. In the Paris Opéra some of the boxes are actually built *on* the stage; but Paris has long ceased to be a model for imitation in musical matters.

Next to perfect acoustics the most important desideratum in an opera-house is physical comfort and safety. The most sublime performance cannot be appreciated by one who feels as if he were in a Turkish bath, and who does not know what moment he will be roasted alive. The facilities of the Metropolitan Opera-house for exit and for extinguishing a fire are unsurpassed by those of any similar house in the world. The seats are the widest and most comfortable ever introduced in a theatre, and there are arrangements for cooling the atmosphere by means of a large fan. The aspect of the house is cheerful if somewhat monotonous. The ceiling produces a pleasant impression, and the dome, with its wide circle of brilliant gas jets, is an immense improvement on the ugly chandelier which disfigures so many auditories and impedes the view of those who occupy the best seats in the upper galleries. The absence of ornament and the prevailing yellow tint are more noticeable when the house is empty than when it is occupied by the fashion and beauty of the metropolis. The reproach of monotony in tint and ornament cannot be made on good grounds. The less there is in the auditorium to distract the attention of the audience the better for the opera and the singers. For this reason Wagner dispensed with all ornament in his theatre, and even arranged his seats in semicircular fashion, so as to take away all temptation for making a display of millinery. From an artistic and musical point of view the large number of boxes in the Metropolitan Opera-house is a decided mistake. But as the house was built avowedly for social purposes rather than artistic, it is useless to complain about this, or about the fact that the opportunity was not taken to make of the building itself, externally, an architectural monument of which the city might be proud.

THE CHANNEL ISLANDS.

NEW FOREST, HAMPSHIRE, Oct. 8.

WE have just landed after a fortnight's voyaging among the Channel Islands. The impressions they leave upon the mind of an Irishman who has visited them for the first time, may not be uninteresting to American readers. The existence of these outlying possessions of the British Crown rests but little upon our minds; perhaps as little as does the existence of Ireland, except for the annoyance it occasions, upon the minds of average Englishmen. How much less, then, are the Islands likely to occupy you? After a ten days' voyage, with the absorbing interests of Europe before him, the American is not likely to tempt the chopping seas of the Channel in a small steamer for anything which these islands have to show. If he has read Victor Hugo's 'Les Travailleurs,' if he now reads Swinburne's "Les Casquettes," or if he remarks in the London National Gallery Copley's fine painting of the death of Major Pierson at Jersey, he will know all that he is likely to care to know about the Channel Islands. Yet their position and conformation are curious, their history is interesting, and their political and social condition presents problems worthy of attention.

The Channel Islands—extending, in a curve north and south, thirty-five miles—are situated in the French bay between the promontories of Normandy and Brittany. In sight of each other and of the French coast on a fine day, they are at their nearest points seven miles from France and sixty miles from England. They are, with their garrisons and fortresses, in truth, another Gibraltar, dividing the coastline of France as effectually as if Brest or Cherbourg had remained to England. Why their possession was never challenged by France during the Great War must be left to tacticians to explain. The chief port, St. Hélier, in Jersey, keeps up its principal communication with Southampton, 130 miles, and St. Malo, 40 miles, distant. The population of the Islands is 90,000; the total area 48,000 acres, one-third of which is waste. You would scarcely miss Ireland from one of your large States; Ireland would scarcely miss the Channel Islands from one of her large counties. They are for the most part table-lands, 200 to 300 feet high. There is some really splendid cliff and coast scenery; but it makes one smile to read in the guide-books that it is "not excelled in the wildest and grandest parts of the west coast of Ireland." There are four principal islands and a few smaller ones, for the most part surrounded by a perfect chevaux-de-frise of rocks and reefs, among which, even in the calmest weather, currents and tides boil and rush. He would be a foolhardy amateur that would venture by himself in a boat outside any of the pier-heads. The manner in which the masters of the trading sloops and steamers trust themselves among the remorseless rocks, generally sheeted with seething foam, shows the most perfect pilotage and the most absolute confidence in tackle and machinery.

That the Channel Islands should form part of the British Empire is one of the curiosities of history. They were in fact never conquered—they are all that remain to England of the land that conquered her. A portion of the feoffs of William Duke of Normandy, they continued faithful to John when he lost France, early in the 13th century; their autonomy, and laws, and language, and customs were respected, and they are now, as they have ever since been, one of the most enthusiastically loyal portions of the Empire. The Islanders have always been jealous of French influence, and in none of the Islands can a French subject own house or lands. They not only have a distinct government of their own, but distinct governments: Jersey, the largest and most southern island, forms one "bailiwick"; Guernsey, Alderney, Sark, and the islets, another. There is little connection between them. They have different laws, different patois, different moneys, weights, and measures. We saw Tauchnitz books for sale in Guernsey, and were told they were not allowed in Jersey. The Islands are not represented in the British Parliament. The Home Government garrisons (at its own expense) the forts, appoints and pays two governors, controls the post-office, and exercises the right of recommending to the acceptance of the "States" of the Islands laws, passed in the Imperial Parliament, which the Home Office thinks it is desirable the "States" should, for imperial purposes, accept or sanction. While we were in Jersey the "Explosives Act" was recommended to the "States" of Jersey, and they had ordered some copies to be printed with a view to taking it into consideration. The lighthouses are under the control of the Trinity Board, but are managed by local bodies. "The Queen in Council" exercises power, to me not as yet clearly defined. In every other respect (in *every* respect, perhaps, in which many of us Irish "extremists" would define Home Rule) they have Home Rule—in more than "every" respect; for they have control over their own customs and excise tariff, a right which I do not think could be pressed for in the settlement which must sooner or later come with Ireland. They have their own militia and police, their own land-laws, the control of their own education, the regulation of their own poor—the few there are of them—and of their own churches. They build their own piers and harbors, and splendid ones they are. The language of the people is a patois, perhaps the old Norman-French, diversified somewhat in the different "bailiwicks" and islands. The official language is French: all the notices and written documents of the courts are in French; also, I believe, the pleadings. We heard an English-speaking prisoner being tried in the police court; but when the depositions were read out, it was evident that they were being translated from the French.

There are two large towns, St. Hélier and St. Peter's Port, of 30,000 and 15,000 population respectively. They are well built, well paved, and clean, with fine markets, such as no city in Ireland can boast. On all sides are seen evidences of thriving comfort and contented civilization. The land is cut up into small-fielded holdings of twelve to thirty-six acres. A farm of 100 acres is rare. The residences are well built of stone, generally two-storied, with nine windows and a door in front. Pretty gardens abound, and flowers, in pots and trellised, are universal. There is no baby-house like neatness in the out offices or cultivation. All is for use and purpose, not for display, as is natural in a country where the owners have themselves to face hard work. A gentleman, settled in Jersey for some years, and who had resided in different parts of the world, told me he never knew more hard-working people.

I have no desire to draw a roseate picture. There are poor in these islands as there are in most places. Weakness and improvidence bear their fruits there as elsewhere. We saw a few children as dirty and untidy as almost any we should see at home in Ireland. We lived for some days in a one-storied thatched cabin on Sark, the ceilings of which we could touch. Our landlady was the wife of a tradesman earning only £20 a year, the renter of a few acres of land. She had five young children to look after and send off neat and clean to school every morning. She had to bake and churn, to wash, cook, and mend, besides in every way doing for

occasional lodgers like ourselves. She was a sweet-looking and sweet-mannered woman. We were given, as a matter of course, napkins and silver spoons, evidently heirlooms, and the drawers from which she took the linen for bed and table did not appear scantily furnished. Numbers of the young men and women of the Islands have to emigrate to sustain the position in which they were brought up. Such poverty as exists is no doubt largely due to intemperance. We were told excessive drinking was very prevalent—as indeed it well might be with brandy and gin at 4s. to 5s. 6d. per gallon. But we saw very few signs of it. We saw two sailors drunk on Sunday in St. Hélier, and another man slightly "under the influence."

Within the last twenty years Guernsey and Jersey have come to reap an annually increasing profit from shoals of summer visitors. For a few months the overcrowded cabins of the small screw steamboats which carry the mails from Southampton, must present in rough weather scenes of human misery and anguish difficult to equal. The hotels and lodging-houses are then crowded by tourists who traverse Guernsey and Jersey in large breaks, stopping every few miles, under plea of rest for the horses, to "refresh" or "lunch." They support fine shops and bazaars, where English-made jewelry and souvenirs are to be purchased at high prices. They practise neat little tricks in smuggling tobacco and flasks of spirits—also cigars, for which latter they generally pay the dealers much more than they could buy the same for at home. Moreover, the usual mildness of the climate, the cheapness of house rent, living, schooling, and the facilities afforded for children learning French under the British flag, attract numbers of permanent residents. French Huguenots sought refuge and freedom of worship in these islands during the bad days of Louis XIV. Many French Catholic families are now temporarily taking up their residence there so as to educate their children as they would wish under the care of the expelled orders. This was told me by an Irish priest, who, while looking forward hopefully to the future of his flock, complained of their want of enterprise in the present to avail themselves fully of the temporal advantages afforded by the land-laws and institutions.

Steam communication has enriched and is enriching the Islands by bringing the London market so near for the sale of their vegetables and fish, and of their grapes, the growth of which, under glass, is becoming an extensive industry. And America also, as well as England, is helping to enrich them, by a growing appreciation of their breed of cattle. I believe, however, that the Islands owe much of their prosperity to peasant proprietary—to the absence of that system of landlordism which, as practised at home, has well-nigh ruined Ireland. Professor Zincke, in a number of the *Fortnightly Review* in 1876, and Mr. Shaw Lefevre, in the same magazine in 1879, have exhausted this aspect of the condition of the Islands. My wish to visit them arose from reading those articles. The writers of both dwell almost more than I should upon this cause of the Islands' prosperity. The first cause of their prosperity is the character and habits of the people, enabling them to reconcile Home Rule with Imperial Rule, and to retain peasant proprietary without relapsing into sordid poverty, or adopting that system of landlordism and large estates which, amid all the comfort and civilization in this beautiful South of England, appears to me so great an evil. Next to the character and habits come without doubt *the* Home Rule, *the* Peasant Proprietary.

The Islands are almost exclusively Protestant, narrowly and sturdily Protestant, with all the grotesqueness and apparent weaknesses, but real strength, of Protestantism in its divisions and its dissents—divisions multiplied and accentuated by French and English-speaking congregations of most of the sects.

To those who are desirous more particularly to study the means by which, in Jersey especially, the Islanders have attained to such perfection in their breed of cattle and to such proficiency in the cultivation of early potatoes and grapes, I cannot do better than recommend a pamphlet —Jobanet's 'L'Île de Jersey: un mot d'histoire, le sol, le bétail, les pommes de terre, le raisin,' to be had of the publisher, Le Feuvre, St. Hélier.

I have only touched upon the many interesting considerations which a visit to the Channel Islands suggests. The thought and liberty there appear more Continental than Anglo-Saxon. Life passes somewhat in a side-eddy: there is a certain smallness and narrowness, and an absence of the wider interests and sympathies of the great world. To what extent would this be affected by the Islands bartering a portion of their autonomy and freedom from taxation for representation and consequent interest in the management of the affairs of the Empire of which they are a part? D. B.

THE AMSTERDAM EXPOSITION.

PARIS, September 30, 1883.

THE International Exposition at Amsterdam had been copiously heralded, and the newspapers have had a great deal to say about it ever since the opening. One got the notion somehow that it was to be the successor of the Philadelphia and Paris expositions. Amsterdam itself made great preparations. New hotels and cafés were opened, and provision of every sort made for the strangers who did not come—at least, until the Exhibition had been three months open. More than a fourth of the hotel accommodations for visitors were unoccupied in July, and it was not until late last month that "double prices" could be asked with any confidence. (It ought to be observed, in passing, that Dutch prices are normally the highest in western Europe: they probably conform to the monetary unit, the gulden, which is worth between two francs and two marks.) As a *naïf* café-waiter remarked to me: "The journals are to blame: they go and report that the Exposition *ne vaut pas grand'chose, et, naturellement, personne ne vient.*" In fact, it was a disappointment, though I had not observed the perfidy of the journals. The Paris papers were content, for the appreciable reason that the French display was extremely creditable: in so tangible a thing as a world's fair, the much-talked-of isolation of the Republic does not appear as yet. But of other countries, only Belgium and Holland with the Netherland colonies made a showing of any importance. The commercial greatness of the British Empire was chiefly evident in the contributions of its Australian connections, and these were vastly inferior to those sent to Philadelphia. The United States exhibit was noteworthy only from a humorous point of view. Of course there was an American bar, but that has become so inevitable a feature of European civilization as to have completely lost its exotic character, and it was served by British barmaids whose knowledge of cocktails must have been most elementary. Besides this there were some curious-looking minerals from Montana, surmounted by a label in bad French and an American flag of nine stripes, I think; some parlor organs from Ithaca, N. Y.; some bottled beer; a half-dozen patented school-desks, designed to seat two, and so, antiquated, I was told; and (perhaps the only truly characteristic contribution) a glass case whose contents celebrated the skill of a New York dentist, and consisted of several sets of artificial teeth, and also of a scarfpin made of a miniature reduction of the same, with a small vulcanite tongue saucily protruding between the ivory rows. It is in the face of such evidence as this that the American in Europe has occasionally to explain that his country is misunderstood abroad, and that, whatever may be observed in pioneer districts, on the Atlantic seaboard at least all classes of society are permeated with a sensitive refinement.

The architecture of an international exposition is generally one of its chief points of interest, but the architectural interest at Amsterdam was of the slightest. The main building was grotesque—a sort of fantaisie on Indian motives—immense heads of elephants and other Oriental animals in plaster contributing its only character to the principal façade, which was else of wood, covered with a kind of linen paper painted white. Nothing more flimsy in either constructional or artistic aspect could well have been designed. Its original is, perhaps, the Paris Eden Theatre, but that is at least of stone, and has a scheme of structure into which its Indian fantasticality is fitted. The new Rijks Museum, now being completed, and destined to contain the city's permanent collections, occupied one end of the grounds, and received from time to time a portion of the exhibits. It is a large and perfectly respectable edifice in pale red brick—perhaps as happy a modification of the ordinary Dutch architecture in a monumental direction as that architecture is capable of without loss of its generally domestic character. An occasional structure among the various ones strewn about the grounds was worth notice, as, for example, the pavilion of the city of Amsterdam, decorated exteriorly by a picture of merit. The fine-arts department was housed in a long wooden shed, the unventilated rooms of which the sun, beating on their low skylights, made ovens of. Near the entrance to the main building was a Javanese hut of bamboo, and hard by a palisaded enclosure, within which a group of Malays kept up a perpetual concert of their peculiar music, the meaning of which no Occidental—except perhaps a Batavian colonist —could, I think, justly pretend to appreciate. For months the machinery hall was apparently a mere limbo, the nature of the ground having proved a sufficient obstacle to the placing and keeping in motion of heavy machines. A French café-concert after the Champs-Élysées general pattern, in another quarter, did not seem very popular. Restaurants and tobacco kiosks constituted the rest of what seemed, both at first sight and after examination, a large fair rather than the much-talked-of "Tentoonstelling." But for the pictures, I should have found, on the whole, more interest at the American Institute.

It cannot be said that the picture-display itself reached to the proportions justly to be expected of a "Tentoonstelling." There was scarcely anything from England, nothing from the United States or Scandinavia, two or three of the merest daubs from Spain (two of whose painters got first medals at Munich); and the recent Italian renaissance, of which every one who saw the Exposition at Rome this spring appreciated the importance, was represented only by some pictures by Segantini. These last were, to be sure, of an excellence wholly unusual. Segantini, I am sure, will be one of the conspicuous painters of the next few years. His pictures have great delicacy, great refinement of sentiment, but he would be almost certain to lose by attempting more ambitious works. This is a feeling one cannot fail to associate with

one's admiration, at all events; and perhaps it is this which mainly distinguishes Segantini from Millet, with whom he has much in common. His subjects are like Millet's—sheep, peasants at work, twilight, tranquillity, with an undertone of effort, of labor, of burdens borne peacefully but inevitably. He has not Millet's incomparable pictorial versatility within these chosen limits, however; what he has to express becomes a trifle monotonous: one argues a delightful artistic sensitiveness rather than power. On the other hand, he has qualities which some of Millet's most important works would be none the less enjoyable, to my notion, for possessing, provided their individuality were kept in all its force: I mean a caressing touch which exhibits sensuousness in the mere handling, an avoidance of melancholy by purely artistic delight in the work, however sympathetic the subject, and—growing possibly out of this—an intense feeling for color in and for itself. In this last respect Segantini, though from Milan, is the inheritor of Venetian rather than of Lombard traditions.

The French display was large and creditable, as a display of French pictures always is, but it was not distinguished, and many of the canvases were very old friends, some of them dating from Salons of several years ago. M. Bastien-Lepage's two London subjects, the "Bootblack" and the "Flower-Girl," for example, had been exhibited previously both in London and Paris. M. Van Beers, the cleverest of all the photographic painters, and, by reason of a peculiar *sel* of his own, become a veritable celebrity, reserved his novelties for the Salon of this year. Many of the great names, Gérôme, Meissonier, Henner, were conspicuous by their absence, and one or two others by a representation wholly unworthy. The German painters were represented in fair force as to numbers, though the Düsseldorf element largely predominated, and I remember but one canvas of interest—a snow scene by Münthe. The transition to the Belgian department was agreeable, though many Belgian painters of eminence now paint in Paris, and are properly to be classed with the French school; and a good deal of the art that is strictly indigenous seems not to have made as many advances upon the period of Flemish tapestry (of which it preserves the traditions, with a good deal of apparent inelasticity) as the rise of the Leys school seemed at the time to promise.

It was naturally in the Dutch rooms that the principal attractions of the entire Tentoonstelling were to be found. The contemporary Dutch school is very well known in New York; it is even popular with us—popular in certain amateur and professional circles, to the exclusion of esteem for other foreign schools. Partly this appreciation proceeds from the exaggeration inseparable from exclusiveness of any sort, and partly it is thoroughly deserved. Now that of the Fontainebleau coterie Dupré alone is left, it would be impossible to find a set of painters anywhere whose feeling for what is poetically impressive in landscape is as strong as that of the very considerable number whose studio windows look out on the quiet shaded streets of the Hague, and who spend the summer months at salt and sandy Scheveningen. Elsewhere landscape painters are much more isolated, and do not count as a "school." But the contemporary Dutch school has manifest limitations which it is idle to overlook. To speak of a contemporary Dutch school in any department of painting but landscape would be to speak of what can hardly be said to exist at all. At their own Tentoonstelling there was scarcely a single really important work not a landscape. Of works of the imagination, strictly so called, picturesque or historical compositions illustrating human life, there were none at all of any dignity. Even the inheritance of seventeenth-century Dutch genre seems for the most part lost; perhaps it was frittered away by the Netschers and Mierises. Of course there were the two Israelses: Isaac, who passes for the Dutch Horace Vernet, which is perhaps a sufficient characterization; and Josef, who sent three large canvases. Josef Israels is a beautiful painter; his technique is true and frank, and yet extremely refined at the same time, and he delights in it with a true painter's delight. The melancholy subject he is always painting is, I fancy, a secondary thing with him, as it is probably with most of his admirers. But after a time one gets quite enough of any side of Josef Israels, perhaps because, from any point of view, and especially from that of pure art, his range is too limited, and his manner as monotonous as his material. Besides the Israelses, and except the landscapes, a good portrait by David Bles, a fine Frisian peasant-girl by Mme. Schwarze, who had evidently studied to excellent purpose the handling of Rembrandt's "Anna Six," and who paints with masculine power, and some white hollyhocks and grapes by Margaret Rosenboom, were nearly everything of note. But the interpretations of out-of-doors nature formed an array that it would be difficult to equal among the works of living painters any or everywhere. Mesdag was in superb force. He was good at the Salon, but here he outdid himself with three canvases of sea and sky and boats—one of them a sunset such as one sees sometimes at Newport, exquisite in its effect of slowly coming twilight. A sky shading somewhere near peacock-blue, by Taco; a bright and clear Rico-like effect, full of color at the same time, by Gabriel; a large shore piece by Mauve; two large James Marises, one a moonlight and the other the broadest day, the sentiment of each admirably rendered; some cows in a marshy pasture, by his brother William; a snow scene in the Hague, with an effect of moist rarefying air marvellously observed; a beach picture, with boats and people at intervals, of which the aerial perspective gave one as distinct a sensation as a color or an odor, by Weiszenbruch, are but a few of the many works of incontestably distinguished merit, to transcribe my notes of which would merely weary the reader. W. C. B.

Correspondence.

THE ENGLISH OF GERMAN COMMENTATORS.

To the Editor of The Nation:

Sir: Apropos of the delightful specimens of the English of German commentators on Carlyle, Dickens, and Tom Hughes quoted in your article on "Theoretical English," it may be well to add a word on the English of a recent commentary on Chaucer. John Koch is known as one of the most accomplished of the new critics of Old English—accomplished both in French and English; a veteran editor and English philologist; a sharp censurer of syntactical and verbal slips; an opponent quite inexorable to the blunders of the alien tribe that dare invade his special field. But listen for a moment to some of the following remarks in English taken almost at random from a *Beilage* of his entitled 'A Critical edition of some of Chaucer's "Minor Poems"' (Berlin, 1883): "I think we ought to *render Chaucer*, as near as possible, his proper orthography"; "the sense does not *allow to omit* a word"; "lines deficient in one syllable in the beginning *are only a few left* in Professor Zupitza's edition"; "I have found scarcely any [irregular lines] in the Prologue, *nor* in the Poems I am going to publish"; "the space allotted to me is rather *scarce*," etc., etc.

After this the German commentators, however accomplished, had better confine themselves to their own language in their commentaries; or is English to undergo the fantastic evolution which Latin has undergone at the hands of the doctoral-dissertationists? J. A. H.

Lexington, Va., Oct. 12, 1883.

SOME CAUSES OF THE OHIO DEFEAT.

To the Editor of The Nation:

Sir: In your review of the causes of Republican defeat in Ohio you forget to note one point, viz: that the Republican party was weighted with the candidacy of Charles Foster for the United States Senate. It was an open secret that the legislative slate was specially devised in the interest of Governor Foster. Governor Foster is the boss of Ohio. He has at one time or another straddled every question upon which the voters divided, and for this reason was particularly obnoxious to that element who desire their representative in the National Assembly to have fixed opinions on great public issues. In this district there were five candidates for the House of Representatives. Four Democrats were elected and one Republican, the one Republican who publicly pledged himself before election to vote against Charles Foster for United States Senator. This opposition has been mainly voiced by the *Penny Press*, a spicy one-cent daily, devoted to free trade, workingmen's unions, etc., whose price puts it within the reach of everybody, and which has great influence with the laboring classes.

Again, while the nominees of the Democratic party were thoroughly in accord with its professions, there were certain inconsistencies in the nominations of the Republican party which could not but cause distrust as to the sincerity of its professions. It professed to stand by the Scott law, and yet the men who in this district were honored (?) by a renomination were the very ones who had worked and voted consistently *against* all regulation or taxation of the liquor traffic; while the very man who was most influential in the passage of the Pond law, and subsequently of the Scott law, Hon. O. J. Hodge, Speaker of the House, *was not even mentioned* for renomination. Such action on the part of the managers could but create distrust in quarters where the Republican party could least afford it. It is a healthy sign, however, that after a hot canvass, and a fuller vote than has ever been known before in this district, the best names on each ticket were elected.

Very respectfully yours,
L. B. Tuckerman.

Cleveland, O., October 22, 1883.

OUR CONSULAR SERVICE.

To the Editor of The Nation:

Sir: Referring to your remarks in the *Nation* (No. 948) relative to the action of the State Department in removing an experienced consul at Naples, Italy, for no assigned cause, and the appointment in his place of an entirely inexperienced man, whose father is a personal friend of the President, I cannot but express my surprise at your seeming supposition that this is not in entire accordance with the usual course of the Department in making consular appointments. A reference to facts will, I think, establish this clearly. In Italy, for instance, there are ten full consulates, including the Consulate-General in Rome. Of these the present Administration (President Arthur's) has filled five anew, and in every case with entirely new men having no acquaintance whatever with the

consular service. In one case it appointed a man of notoriously *bad habits*, who, it is understood, had to leave another branch of our Government service on that account, and whose most highly respectable family kept him abroad for years in the vain hope of his reform. His appointment was so unsatisfactory to American residents at the place that even the Vice-Consul—a man whose name is well known to the readers of the *Nation*—at once sent in his resignation, giving his reasons therefor, and would never enter the consular office. In another case, a gentleman was appointed consul to one of the principal Italian ports (the most lucrative consulate in Italy, perhaps, on account of two good consular agencies) because, as he states the case himself, he is a personal friend of the President, was out of employment and in rather bad health, and the President offered him the position. He knew nothing whatever of the consular service or any foreign language, and is too old to learn. But he is a most amiable old gentleman, and personally, I presume, the appointment is satisfactory. It is true, I have heard it stated, from a source likely to be well informed, that this appointment was made in the interest of one of our highly-protected monopolies, with one of the managers of which the Consul is closely connected; but this would seem almost impossible, that a consul should be appointed rather to obstruct than to promote trade. In another case—also to one of the most important ports—the appointee's wife was in bad health and needed a milder climate. The Consul is without experience in the service, and knows no foreign language, but otherwise I have heard him highly spoken of. To a newly-created consulate, which has to be organized, an entirely inexperienced man has been appointed. I have no doubt an examination would show the custom of the Department to be in general about the same in other countries. In one case I happen to know of, a gentleman was appointed to one of our most important consulates because, as he himself states, he was a little out of health and wished his family to see a little of Europe and learn a little of foreign languages. He was away from his post much of his time, said he came only to remain a year, and has now, I think, returned home, to remain.

The only question with the Department of State in making foreign appointments, diplomatic as well as consular, seems to be as to the amount of political or personal influence the applicant can bring to bear, with perhaps some inquiry as to his record as a "Stalwart," and on the Hubbell "Corruption Fund" in case he has been in the service. No questions as to character, qualifications, or special fitness are taken into consideration. I have known of some cases where very old, feeble men, with one foot already in the grave, so to speak, worn-out country doctors, village editors, ward politicians, etc., have been sent abroad to fill important consular positions, with no knowledge whatever of the language of the country they go to, and utterly without consular experience. No wonder if such men fall in with improper surroundings, and often bring our consular service and Government into well-merited disrepute, for they are absolutely dependent. Could our Government and people be made fully aware of the discredit often brought upon us and our institutions by our system of foreign appointments, surely Congress might be induced to do something to remedy the evils. INDEPENDENT.

GRATUITOUS DISTRIBUTION OF THE ENGLISH VERSION OF THE MAHÁ-BHÁRATA IN AMERICA.

TO THE EDITOR OF THE NATION:

SIR: An association of native Hindu scholars, called the Datarya Bharat Karyalya, has for several years been publishing, for gratuitous distribution to Sanskritists, learned societies, etc., translations of leading Sanskrit works. At present an English translation of the Mahá-Bhárata is publishing, primarily for gratuitous distribution—a certain number of copies being, however, reserved for sale to parties desiring the work not included in the distribution as above. The manager and publisher of the association, Babu Protaba Chandra Roy, has requested me to send him a list of the literary and other societies in America interested in Sanskrit literature, to which copies of his publications may be sent. I shall be pleased, therefore, if any reader of the *Nation* having a knowledge of any such society will send me its name and address for transmission to India. Any person desirous of procuring a copy for himself can obtain information as to terms, etc., by addressing the Babu at 367 Upper Chitpore Road, Calcutta, India.

WM. EMMETTE COLEMAN.

PRESIDIO OF SAN FRANCISCO, CAL.

REPRESSION IN IRELAND.

TO THE EDITOR OF THE NATION:

SIR: In one of the editorial paragraphs of your current number I find the following passage:

"The passion occasionally displayed by quiet preachers and literary men for the ferocious use of military force against people whose ways they disapprove of, is one of the mysteries of human nature. Men who seldom quit their libraries, and have not nerve enough to see an arm amputated, are sometimes found advocating the most bloodthirsty courses against their particular set of heathen. Carlyle and Froude are the two most conspicuous instances of this literary thirst for blood. Froude has always approved of having plenty of Irishmen put to the sword or tortured, while Carlyle was disposed to apply the same remedy to poor men of all races, beginning with the 'niggers' *Mr. Goldwin Smith also desires liberal gibbeting and shooting in Ireland.*"

I think I may safely challenge you to produce from my writings on the Irish question, or on any other question, anything which can lend the slightest semblance of justice to this charge.

"Shooting" can take place only under martial law; and when, from the increasing number and atrocity of the outrages in Ireland, martial law began to be suggested as the only remedy, instead of advocating I deprecated it as "the substitution of one sort of savagery for another." My words, I remember, were cited with approbation by the *Pall Mall Gazette*, your own ally on the Irish question.

By "gibbeting," I presume, is meant hanging. When it became clear that common juries in Ireland, being under the influence of the League, could afford no protection to the lives of loyal citizens, I, among other journalists, advocated the institution of a more trustworthy tribunal. This measure, the proposers of which were of course denounced by the Irish terrorists and their friends, was, after the Phœnix Park murders, at length adopted by the Government. It has worked perfectly well; justice and nothing but justice has been done; the assassinations have almost ceased, and the country has been delivered from the fear of an outbreak which could not have been repressed without bloodshed. I believe nobody doubts that had the step been taken earlier it would have averted a hideous series of murders and the almost equally hideous series of hangings which has followed.

I have been in favor of upholding the law, doing justice on assassins, and taking those measures of repressive police which are necessary to prevent insurrection and bloodshed. Any remarks which these opinions may justify I am willing to bear. I am not so willing to bear the unfounded imputation of inhuman sentiments, to which I have never given utterance and which are at variance with the whole spirit of my writings and my life.

Your obedient servant,

GOLDWIN SMITH.

[We undoubtedly have done Mr. Goldwin Smith injustice if we have given the impression that he has advocated bloodshed in his writings. We based our remark on reports of his talk about Irish matters when he was last in England, which of course may have been inaccurate. But he is, on the other hand, mistaken in supposing that the tribunal which the Government finally set up in Ireland for the punishment of crime was the one he advocated. What he urged, with much vehemence, in several letters to the *Times*, during the year 1882, was the suspension of trial by jury, and the substitution of a commission of judges, having previously strongly urged the system of arbitrary arrests which was administered by Mr. Forster. What the Government did was to substitute special for common juries, and transfer the trials to Dublin, a simple expedient which, if resorted to sooner, would have saved the Liberal Ministry from the scandal of Mr. Forster's somewhat ridiculous experiment.—ED. NATION.]

Notes.

TOWNSEND MAC COUN, 744 Broadway, has purchased the remaining sheets—about 100 sets of nine volumes each—of the edition of Jefferson's Works published by order of Congress, the plates of which have been destroyed. They will soon be put upon the market in a plain but attractive binding.

'Arius the Libyan; an Idyl of the Primitive Church'; 'Fair Words about Fair Women,' gathered from the poets by O. B. Bunce; Cobbett's English grammar, edited by Alfred Ayres; and 'Anecdotes of the Civil War,' by Maj.-Gen. A. D. Townsend, will be published immediately by D. Appleton & Co.

Charles Scribner's Sons have in press 'Golden Thoughts from the Scriptural Guide of Miguel Molinos, the Quietist,' accompanied by a preface by J. Henry Shorthouse, and a brief biography of Molinos by Professor Lindsay, of Free Church College, Glasgow; also, a new edition of Cable's 'Grandissimes,' which we do not altogether like to hear has been revised by the author, so that much of the dialect of the dialogue has been eliminated.

Nine of the twelve projected volumes of the delightful "Parchment Shakspere" (D. Appleton & Co.) have now appeared—the eighth containing "Troilus and Cressida," "Coriolanus," and "Titus Andronicus"; the ninth, "Romeo and Juliet," "Timon of Athens," and "Julius Cæsar."

Volumes v. to viii. of the Riverside edition of Emerson's complete works (Houghton, Mifflin & Co.) embrace 'English Traits,' 'Conduct of Life,' 'Society and Solitude,' and 'Letters and Social Aims,' respectively. In the first-named, one is struck by the chance hit of Wordsworth, in his first interview with Emerson (1833): "He has even said, what seemed a paradox, that they needed a civil war in America, to teach the necessity of knitting the social ties stronger." We remark again, in reading the poetical epigraphs of the various essays in the 'Conduct of Life,' the extraordinary difficulties in printing the verse of Emerson correctly, whether as regards punctuation or literal accuracy. Thus, in that on Behavior, p. 161, the proof-reader or corrector has let

pass: "Too weak to win, *to* fond to shun," etc. The editor, Mr. J. Elliot Cabot, explains the melancholy circumstances under which the volume of 'Letters and Social Aims' was made up by himself, and the small part which Mr. Emerson, whose powers had already begun to fail, had in the arrangement of it. We have a curious illustration of the way in which Mr. Emerson's mind worked—its want of consecutiveness and orderly disposition—in the fact that these essays, gathered from disconnected scraps and unpaged MSS., are probably about as well joined and as truly Emersonian as if their author had struck them off in one heat. In the nature of the case no dates could be affixed to them, but we must think it a serious omission that those in the fifth and seventh volumes have no indication of the time at which they were composed, delivered, or first published.

Two volumes of the "Classic Series" (Roberts Bros.) bring us Southey's 'Life of Nelson,' and 'Classic Tales by Maria Edgeworth.' Both these volumes are in large print, and the form and woodcuts of Southey's enduring biography give it a very pleasant air of having been published in our childhood. Miss Grace Oliver, whose life of Miss Edgeworth we reviewed not many months ago, prefixes a brief sketch of her heroine to a selection which includes "Simple Susan," "The Mimic," "Waste Not, Want Not," "Mademoiselle Panache," "Angelina," and "The Orphans." Parents will welcome these reprints.

By a kind of doubling which seems much in vogue this year, Southey's 'Nelson' has also been brought out by J. B. Lippincott & Co., in a somewhat larger shape, with full-page designs in place of vignettes, a steel portrait for a frontispiece, and with a prefatory account of the biographer himself, in six pages. It is, perhaps, worth mentioning that the Greek couplet with which the Life closes is differently and wrongly accented in both the Boston and the Philadelphia editions.

'The American Girl's Home Book of Work and Play,' by Mrs. Helen Campbell (G. P. Putnam's Sons), ought to find a place on every Christmas memorandum wherein young girls are remembered. The tribute paid in the preface to Mrs. Child and the 'Girl's Own Book' will be heartily repeated by every mother and grandmother whose childhood was delighted by that little book. The one now compiled on the same plan contains many things otherwise hard to find in the special manuals which have been in vogue of late. Throughout there is the same good sense and refinement which have always distinguished Mrs. Campbell's work. Of this latter quality—the delicacy, the good breeding which belongs to character more than to mere manners—there has been a lamentable want in books for girls, the place of all others where it is most needed.

'Work for Women,' by George J. Manson (Putnams), does not pretend to offer anything entirely new, yet it will be far more useful than most books of its class. It gives distinct directions where to find the best schools, or the best manuals, from which to learn the different occupations enumerated. Moreover, it most distinctly sets forth, from first to last, that hard work and long work are indispensable to success. "The necessity of practice cannot be overrated. . . . Last of all, she must have great perseverance, and work continuously." Equally clear and equally wise are the statements of what a woman cannot expect to do. "She can never hope to perform as much work as a first-class male compositor; that is a physical impossibility." And there is true kindness in the exposure of some of the fallacies about the pay of women. Irreparable mischief has too often resulted from the shallow counsels of advisors either inexperienced, or too careless to discriminate between an exceptional good fortune and the average success.

The publishers (Charles Scribner's Sons) present 'Mrs. Gilpin's Frugalities,' by Susan Anna Brown, in the same dainty fashion as the 'Forty Puddings.' It will serve two quite opposite ends—to give variety to the table in a large family, and to provide an economical use for the inevitable remnants in a small one. The most useful thing in the book, however, is the warning against "stingy extravagance and wasteful scrimping," and the wise suggestions as to true frugality. "There is that scattereth and yet increaseth." There are more women who know how to do without cheerfully than there are who understand the best use of a little.

A new chapter must be added to the book of woman's rights and wrongs. We have been told so often that man makes the laws for woman to suit his own desires and interests that we have become ashamed, and have changed our practice, and in some of the States woman is in a better condition before the law than her former tyrant. But now comes one calling herself "A Stout Lady" and complains in a London paper that her sex is still oppressed: the turn-stiles at the Fisheries Exhibition are too small for women, though they are well enough for man. The average man is broadest at the shoulders, and goes through a narrow turn-stile without difficulty; the average woman is broadest at the hips, just where the turn-stile catches her. If Woman had had the making of them, they would have been higher or broader, but Man has made them to suit himself. "A Stout Lady" evidently cares not who has the making of a nation's laws; give her the making of their turn-stiles.

'Industries of North Carolina' (E. J. Hale & Son) is the title of a small volume, containing 425 pages, compiled at Raleigh by P. M. Hale, in which the varied resources of the State are set forth generally. The more important portions of this compilation, however, refer to the coal-fields and iron ores, and are drawn from the reports of the State Geologists, Doctor Emmons (1852) and his successor, Doctor Kerr (1875), of whom the last named is now Geologist in charge of the Southern Division of the United States Geological Survey. A report to the War Department by Col. T. T. S. Laidley (1856) on the Deep River timber and minerals, and one to the Secretary of the Navy by Admiral Wilkes (1858) on the Deep River region, are also included. Of more recent date is a paper by Doctor Kerr (1880) on the resources of the country along the line of the Cape Fear and Yadkin Valley Railroad through the middle region of the State. There are also brief descriptive notes on the natural resources and the industrial and social conditions of nearly all the counties in the State, contributed by various local observers and drawn in part from the Tenth Census. The volume contains a small folding map, but no index. It describes a country of large and varied, but, so far, very slightly developed, resources.

The new (fifth) edition of Moses King's 'Handbook of Boston' shows a considerable enlargement and revision to date, as in the chapters on the town history, the hotels, the railroads. In the sections on public works of art we observe mention of one additional soldiers' monument and two statues, together with one monument that might have been, and two that are assured in the near future. We miss even the inadequate map which graced the former edition. But there should be several, in characteristic sections.

From the office of the Secretary of State of New York we have received the third volume (new series) of 'Documents Relating to the Colonial History of the State of New York,' bearing the special title of 'Documents Relating to the History of the Early Colonial Settlements, principally on Long Island.' The translation, compilation, and editing from the original records have been performed by Mr. B. Fernow, and a fragmentary map of the western part of the island, made in 1666, has been copied for this work in facsimile. The first period extends from the first recorded Dutch patent to the occupation of the province by the English (1630-1664); the second, to the establishment of counties (1664-1684). A full index, chiefly of names, makes these documents readily available for research. Stuyvesant, Governor John Winthrop, and Andros figure largely in this volume. While the question of boundaries and jurisdiction with the adjacent English colonies was a burning one, Stuyvesant writes to the Directors, August 4, 1664, that experience of their English neighbors had taught the Dutch that "deeds of sale and conveyances are little respected by them, especially when they are of earlier date; . . . but when their deeds are older than ours, then they must be accepted as valid without objection." On December 1 the Boundary Commissioners were formally notified that Governor Winthrop and the other Connecticut deputies had assented to all of Long Island remaining in the Duke of York's patent. The volume is a worthy addition to the invaluable series which it continues.

Mr. Justin Winsor begins, in the October Harvard University Bulletin, a critical annotated calendar of the late J. G. Kohl's collection of copies of early maps of America, now preserved in the State Department at Washington.

Mr. Edward Roth's Complete Index to *Littell's Living Age* deals still in its third part with Biography, carrying the work from James to Lescarbault. The leaves being printed only on one side, it is practicable to incorporate this index with any other.

A handbook, no longer for henchmen and heelers but for the honest public at large, called the 'United States Salary List and the Civil-Service Law, Rules, and Regulations,' comes to us from Henry N. Copp, Washington. Specimen examination papers are given in addition to the information referred to in the title. As Mr. Copp says, "To professional politicians and their friends, almost exclusively, this knowledge has heretofore been confined." He estimates the civil service as embracing more than 100,000 persons.

The Portland Society of Art have issued a prettily printed catalogue of their fall exhibition of portrait engravings. The body of the type is in black; the name of the artists, of which there are three or four on the small quarto page, are in red ink, and printed from a curiously-ornamented type. Brief notes give biographical and critical data about the artists, and still briefer notes describe the state of the plate.

During the last two years the author of 'Alice in Wonderland' has been writing what he calls "A Tangled Skein." Each "knot" is a droll bit of story, into which is cleverly interwoven a mathematical problem. The puzzles are so ingenious, and the nonsense so delicious, that it is a pity they should not be known outside the small circle of readers of the *Monthly Packet*, the magazine in which they from time to time appear.

We regret to notice the discontinuance of the *Chrysanthemum*, published at Yokohama, with the June number, the contents of which certainly bear out the excuse offered by the proprietors that they have found it "impossible to obtain a sufficiency of suitable contributions." Otherwise, public support has been "kind and liberal."

The number in question concludes Mr. F. Brinkley's "History of Japanese Ceramics," and has a long paper, with tabular statistics referring to Japan, on "Missionary Work and its Effects upon the Workers."

The Mitchell Library, Glasgow, calls attention to the issue of its second million of volumes, which was completed on the 1st of September in 808 working days. The first million, issued when there were of course fewer books and fewer readers, occupied 982 working days. We hope libraries will not take to running races in circulation, or to making issues against time—so many million volumes in so many hundred days. The public would become as tired of it as they became of walking matches. It is very remarkable that this million volumes consists in so small a degree of fiction, only 7.73 per cent., while history and biography are 21.77, arts and sciences 20.12, and miscellaneous literature 28.31. The latter, to be sure, must include considerable fiction in a periodical form. The proportion, however, still remains unusual.

It is little more than a quarter of a century since Murger discovered or at any rate revealed *la vie de Bohême* in France, and now MM. Revillout and Krall have presented to the Academy a description of Bohemian life in Egypt, relying chiefly upon the account of a certain musician who, according to an Egyptian satire, from which they translate a long extract, neglected his art for good cheer and drink.

M. Maspero has given the French Academy an account of the resources at his command for archæological investigation in Egypt and the maintenance of the Bulak Museum. Formerly there was no fixed budget; the Khedive supplied money as he happened to be in funds—a little this year, a great deal the next, none at all the third—which compelled the work to be very irregular. Since 1878 M. Maspero has had an annual but meagre allowance of 35,000 francs. As the low-priced assistants whom this small income compels him to employ are unable for want of archæological knowledge to discriminate between valuable and valueless discoveries, a matter in regard to which prompt information is often important, he has tried the experiment of taking five young natives into the Museum as antiquarian apprentices, intending to teach them some smattering of hieroglyphics. The excavations actually in progress are under the charge of eight native *reis*, who by long employment have acquired considerable interest in their work, and even a certain skill in reading hieroglyphics.

In *Das Magazin* for September 29 Eduard Engel apologizes for having paid so much attention to Mrs. Pott and her Baconian 'Promus,' since a visit to the British Museum has made it plain to him that the manuscript 'Promus' is in diverse handwritings, no one of which can be confidently identified with Bacon's. Moreover, Mrs. Pott has been careless beyond belief in her transcriptions, and Herr Engel gives harsh names ("Bacon-Schwindel," "absichtliche Fälschung," etc.) to this unhappy lady's enthusiasm.

—The Architectural Association of Boston has issued a portfolio of thirty Albertype reproductions from sketches by its members which is of unusual interest, not because the drawings are altogether good, but because some of them evince a degree of artistic feeling which is comparatively rare among architects at the present time. The drawings are largely from fragments of architectural sculpture, and it is these which chiefly interest us. There are two qualities of good sculpture which seem too often to escape the observation of architects. The one is vitality of line and surface—an expression of that fine sense of nature which good designers have always possessed—and the other is a free-hand character of execution whose product is widely different from that which is mechanically wrought. It is the unusual appreciation of these qualities, as expressive of the spirit of the designer, which, more than anything else, commends some of these reproductions to us, and which seems to us especially encouraging because it is the lack of this appreciation which goes far to render our modern architectural sculpture so uninteresting and ineffective as it is. This lack is due in great measure to inadequate conceptions of what constitutes architecture, and the functions of the architect. Few teachers or writers approach the subject of architecture sufficiently from its artistic side. It is too commonly viewed in its mechanical and scientific aspects, though these constitute but a small part of architecture considered as a fine art. The drawings set before students in our architectural schools, and the illustrations to some of the best books on architecture, are, accordingly, so highly mechanical that no just idea is conveyed by them of the qualities which are most admirable in ornamental design. If the work displayed in this portfolio is, as it appears, the result of an awakening sense of what design truly is, its value will be considerable, and its influence may be great. But while we recognize in this work a hopeful tendency, we are unable to commend, without a good deal of qualification, the general character of a great part of this delineation considered as such. There is very little of it which can be called excellent. An architect's drawing should not be loosely picturesque, as much of this is. It should be definitely and firmly expressive of the facts of form and structure treated, in any given case, in so far as the eye appreciates them. There is far too little clear and intelligible drawing in these examples. There is too much indeterminateness, and even feebleness, bespeaking imperfect training and imperfect conception of subject. But in this regard the drawings differ one from another. Some of them are as hard, mechanical, and feelingless as average modern architects' drawings usually are, while others betray an effort to imitate a sketchy method, like that of Prout, without a perfect understanding of the qualities and the defects of such sketching. In the examples of this class, details are defined in one place, and are undefined in another, in a capricious and meaningless way, so that the result is not valuable either as artistic sketching or as scientific record of structural facts. For an architect the precision of Dürer is a more valuable quality in delineation than the vagueness of Prout. But the best method is one in which precision, visual truth, and artistic feeling are combined.

—Formidable is the amount of examination work performed of late under the superintendence of the English Civil-Service Commissioners, as found recorded in their twenty-seventh annual report, recently presented to Parliament. In 1880 the aggregate of cases dealt with by the Commission amounted to 20,452; in 1881, to 24,243; and in 1882, to 26,409. The increase of cases during the last year is ascribable, in some measure, to a considerable development of the system of open competition as applied to the appointments of female clerk and female telegraph-learner in the Post-office, but still more to a general advance in the average ratio of competitors to vacancies; this ratio having been 10 to 1 in 1882, whereas it was only 6.5 to 1 in 1881. For the Home Services the falling off of competitors in 1882, as compared with 1881, was 514; for the Indian Services, 31; and, for the Military Services, 450. On the other hand, however, there were more competitors, by 216, for appointments in the Naval Services. Among the candidates for the Military Services, those aspiring to find employment as lieutenants of militia were fewer by as many as 169; or only 234, as against 403 for 1881. The cases connected with the four sets of services named above being deducted from the grand total, 26,409, there remain, under the head of miscellaneous, 21,456 for 1882, showing an increment of 2,945 over the cases for 1881. Out of the 21,456 candidates just referred to, those that passed their examinations supplied, on an average, 6.8 effective competitors for every existing vacancy; a conclusive evidence of the popularity of service under the Government, and of the pains bestowed in the hope of securing it. The value of the fee stamps presented by examinees in 1881 was £12,554; in 1882, in consequence of an authorized reduction of certain fees, £11,018. Nevertheless, the Commissioners anticipate that the annual proceeds from fees will, in future, not fall short of £13,000; and the steady growth of business in their department no doubt warrants their anticipation.

—In No. 951 of the *Nation* we explained on what grounds M. Clermont-Ganneau, sent to London by the French Ministry of Public Instruction to ascertain the value of Shapira's Deuteronomy, "did not hesitate to declare in the *Times*, after the brief and partial inspection allowed him, that the Deuteronomy in King Mesha's style of writing, alleged to be almost 3,000 years old, was written on the cut-off margins of a modern synagogue roll." We also stated that Dr. Ginsburg, after performing "with conscientious slowness" the task imposed upon him by the British Museum of deciphering, transliterating, and translating the manuscript, reported in agreement with M. Clermont-Ganneau's exposition. We ought to have added that he did it without mentioning the name of the French scholar, though he reproduced his conclusive evidences of the forgery among other proofs, almost literally, which, in fact, was unavoidable. Of course, Dr. Ginsburg committed no plagiarism in the matter, for his report appeared when the Frenchman's communication was quite fresh in the memory of the readers of the London *Times*. Yet the English Orientalist's over-serious treatment of a matter which in Berlin had been contemptuously disposed of in two hours; the anticipation of a wonderful confirmation of the traditional age of Deuteronomy, which his slow proceeding nourished in theological circles; and the final sentence pronounced so late and in strict conformity to outside indications, placed him in a rather awkward position. From this various English newspapers, entrapped partly by a leaning toward the supernatural in Biblical matters and partly by partiality for native scholarship, endeavored to disentangle him by accusing the Frenchman of acting from preconceived notions and anti-Biblical prejudices, of haste in forming his decision and greater haste in making it known, of making use in his discovery of the fraud of previous hints by Dr. Ginsburg, etc. These attacks M. Clermont-Ganneau scathingly repels in the *Revue Politique et Littéraire*, of September 29, in an article entitled "Un prétendu manuscrit original de la Bible," in which he tells the history of his connection with the affair with great minuteness and in a very pleasant vein, exposing in strong light the forger's manipulation and network of lies; the absurdity of believing for a moment in a treasure so miraculously preserved and found; the ridiculous jealousy with which the "find" was protected in the Museum from foreign examination; and the superstitious bias toward hypocritical rascality which now assailed him. The whole forms a chapter of literary history equally amusing and instructive.

—If the great "maker" could be born in seven different cities, it is not unfit that the discoverer of the New World should have at least five birthplaces. The Abbé Martin Casanova di Pioggiola, however, wishes to limit him to the Corsican Calvi; M. Henri Harrisse, on the other hand, is sure that Genoa is the only rightful claimant. In the *Revue Critique* M. Harrisse gives strong reasons for the common belief, and demolishes the arguments (weak enough as they appear in Harrisse's account) of the Abbé Casanova. But the French President issued a decree last August approving of the erection of a statue of Columbus in the city of Calvi, and no doubt all Corsicans and a certain number of Frenchmen will persist in claiming him as a countryman of Bonaparte. In the same number of the *Revue* we find a notice of two tracts relating to this country, by M. Eug. Beauvois. One is 'Une vendette dans le nouveau monde au XIe siècle d'après les textes scandinaves,' being an account of the vendetta of the poet Thormod against a chieftain of Greenland and his descendants. The other is 'La grande terre de l'Ouest dans les documents celtiques du moyen âge.' M. Beauvois believes that the Irish had early visited New Brunswick, because the Icelandic sagas speak of a Gaelic colony south of Helluland (Labrador) and north of Vinland, and confirms his belief by Irish legends which show at least that the Irish had wished to find the western shores of the Atlantic. If they explored, he says, why may they not have been as successful as the Scandinavians undoubtedly were? There is at least this bright point about these rather vague speculations: no one will try to find out what was the natal city of these Irish and Scandinavian discoverers.

—No editor succeeds better than Julius Rodenberg in securing for his magazine famous names without sacrificing the quality of his articles. The October number of the *Rundschau* is one of the best ever issued. It contains novelettes by Paul Heyse and Wilhelmine von Hillern, and essays by Ernst Haeckel, Du Bois-Reymond, Von der Goltz, Geffcken, W. Scherer, and Rodenberg himself. Heyse's novelette describes, in his usual elegant style, the life of a hermit of the 14th century, who is avoided as an outcast because he once assumed the functions of a general nurse during the prevalence of the plague, and who now makes a living by means of his violin. A dreamy but gifted young man is so overcome by his playing that he abandons his beautiful but heartless bride, and follows the hermit into the woods, but is recaptured, and, in his efforts to escape, loses his life in the Rhine. Rodenberg's article is partly sentimental reverie, partly realistic description of a unique part of Berlin known as In den Zelten. The changes in the appearance and habits of the Berliners within a few generations are brought clearly before the eyes of the reader. Geffcken writes on Baron Nothomb, Scherer on Jacob Grimm, and Von der Goltz on "Science and Military Affairs." The two most important articles, however, are those by Haeckel on Adam's Peak in Ceylon, and by Du Bois-Reymond on the Humboldt statues in front of the University of Berlin. These two distinguished representatives of zoölogical and physiological research are both Darwinists, although the elder maintains a certain dignified reserve based on jealous regret that he was born too early to become, like Haeckel, a militant co-worker in the department of evolution. The confession of their common creed is, however, introduced only incidentally in their present articles. A more striking resemblance is presented in the proof they afford that scientific erudition is not incompatible with a lucid, flowing, and imaginative literary style, in the possession of which these two writers are distinguished above all other German professors, and equalled only by Tyndall and Huxley in England.

—Du Bois-Reymond is particularly qualified to write on the two Humboldts, since he has made as close a study of the social phases of their time as of the scientific. He was personally acquainted with Alexander Humboldt, who, he tells us, used to read to him from the proof-sheets some of the most eloquent passages in his 'Cosmos,' and who, among other things, made him a present of the copy of Agassiz's 'Essay on Classification,' which the author had sent him. "Humboldt's remarks on this occasion," he adds, "left no doubt with me that, far from sharing Agassiz's views, he was a believer in mechanical causation and evolution"; and he accordingly claims him as a "pre-Darwinian Darwinist," Agassiz's essay having appeared only three years before the 'Origin of Species,' which Humboldt did not live to see. A good notion of Humboldt's giant intellect is given by the statement that at Jena, although "twenty years younger than Goethe and ten years younger than Schiller, he was nevertheless greeted by both as an equal." At first, indeed, Schiller was inclined to underrate his "naked, incisive intellect," and would have been astonished had any one predicted that the German nation would one day erect a statue to him near his own. Humboldt formed the bridge between the modern mathematico-biological and the preceding philologico-historical, æsthetico-speculative Germany. Wilhelm von Humboldt's importance, aside from his literary achievements, lies in this, that by founding the University of Berlin he made that city the intellectual centre of Germany. Haeckel's article is an interesting pendant to his book on Ceylon. He gives a short sketch of the earliest attempts to ascend Adam's Peak, and follows it up with a detailed and fascinating account of his own trip. The difficulties of ascent are still great, although much has been done in the way of building bridges and attaching chains to dangerous localities. In many places, however, these chains are superfluous, as the tourist if he falls is sure to be caught in the impenetrable green pillows formed by the tree tops. For more than an hour the road leads through a green tunnel formed by the dense forest—a great advantage in such a latitude. A party of natives, consisting of men, women, and children of all ages, was met on the way and admired for their lithe yet vigorous physique. At the top, where Haeckel spent six hours, he observed the rites of the pilgrims, which consisted in prayers before the alleged footprint of Adam, offerings of flowers, burning of candles, ringing of little bells, and presents to the priests. A contrast is drawn between the peaceful attitude of the Mohammedans, Christians, Buddhists, and Brahmins, who here meet in common worship, and the petty quarrels of our own religious sects. His own devotions consisted in admiring the scenery (which he found more picturesque than grand and not equal to that obtained from the snowy peak of Teneriffe), and in delivering to his companions a short address apropos of Darwin's birthday. "The letter," he concludes, "in which I communicated this to my highly-respected friend, written under the canopy of the Scripada, was the last he received from me."

—While antiquaries are busy raking up the rubbish of thousands of years in their endeavors to locate the position of Alesia or of the Raudian Fields; while we are informed that the Munda of Cæsar's triumph is probably not the Monda of to-day, or that Carchemish, where Nebuchadnezzar conquered, is not, as was formerly supposed, the same as the classical Circesium, the searching pen of the modern encyclopædist has begun to conjure up perplexities with regard to things much less remote. Among the names most gloriously associated with the career of Marshal Saxe is that of Raucoux. Historians tell us how in 1746 (in the War of the Austrian Succession) that illustrious general reduced the principal fortresses of the Austrian Netherlands; how the Austrian General Charles of Lorraine was sent to check his progress, and how at a place called Raucoux, or Rocoux, Saxe triumphed over the forces of the allies. The engagement was fought in the outskirts of Liége. In Pierer's 'Universal-Lexikon' the location of the noted battle-field is transferred to Raucourt, a small town in the vicinity of Sedan, within the territory of France. Beeck's 'Handlexikon der Geschichte und Biographie' (Berlin, 1881), which is on the whole a most accurate reference book of chronology, contains the same error. Turning to the recently published 'Lexikon der allgemeinen Weltgeschichte,' belonging to Meyer's Fach Lexika, we are in like manner informed that Raucourt, or Rocoux, is a town in the French department of Ardennes, memorable for the victory of Marshal Saxe. The latest edition of Pierer, published a few years ago, in the article "Raucourt," not only repeats the error contained in the fourth edition (published in 1861), but makes matters worse by introducing in parenthesis after the title "Raucourt" the form *Raucoux*. Things like this are apt to give the literary public a rather gloomy view of the doings of the cyclopædia-maker. But here charity must spring from the very source of our indignation. This *Raucoux* is the best illustration of the troubles and perplexities with which he is weighed down at every step. Cyclopædia-makers, like ants and bees, are compelled to draw on the stores laboriously accumulated by workers like themselves, and thus errors are repeated and perpetuated. Turning now to 'Lippincott's Gazetteer,' we fail to discover any such title as *Raucoux* or *Rocoux*, but we find *Rocour*, which is stated to be a village near Liége, and Marshal Saxe's victory is correctly given here, and not under the title "Raucourt." Ritter's 'Geographisch-Statistisches Lexikon' agrees with Lippincott as to the spelling of the place where the battle was fought, while in Baedeker's 'Belgium and Holland' the name is written Rocourt. Here, then, we have four different ways of spelling one and the same place, and, singularly enough, the form commonly used by historians, *Raucoux*, is not to be found in our geographical works. The contradictions do not end here. The victory gained by Marshal Saxe is generally represented to have been one over the "allies," which is correct; but in Pierer and Beeck the Austrians alone figure, while in the very valuable 'Encyclopædia of Chronology' of Woodward and Cates, under the title "Saxe," we are told that the enemy were English and Dutch.

RECOLLECTIONS OF A NAVAL OFFICER.

Recollections of a Naval Officer. 1841-1865. By Captain William Harwar Parker. Charles Scribner's Sons.

CAPTAIN PARKER'S career was from first to last an eventful one. Entering the service in 1841, he took his place among the last officers of the old navy—the navy, that is, of the period before the Academy at Annapolis was established, and before modern science had transformed the instruments of naval warfare, and, along with these, the time-honored customs of the service. The navy of that day was the navy of Marryat and of Cooper. The life of the ward-room, the steerage, and the forecastle was very much what

it had been a hundred years before: the same yarns were spun, the same practical jokes were played, the same characters existed. The seventy-fours, the sailing frigates, and the old man-o'-war's-men still flourished. The traditions of 1812 were still fresh and vigorous: officers settled their disputes with pistols at ten paces, and the ration of grog and the cat were the official emblems of bliss and woe to the blue jacket. Of life in the service as it existed at this time, the early chapters of Captain Parker's book give a faithful picture; and, although it represents the beginning of a transition period, the details show vividly how little the coming change was foreseen or imagined. His first cruise was in the *Columbus*, a well-appointed line-of-battle ship, with a crew of 800 men. One night, while the ship was lying in port, the watch on deck were startled by an unusual sound, which was afterward found to be caused by a neighboring steamer blowing off steam under water. On the passage from Madeira to Rio, when target practice was ordered, the crew found the shells a "great bother" to them. The divisional officers were uncertain whether the fuse should or should not be ignited before the shell was placed in the gun. The gun drill still consisted of the old orders: "Handle your match and lockstring; cock your lock; blow your match; stand by; fire"—and all were given so deliberately that practice at sea could be carried on just as effectually without a target.

During the next few years progress made rapid strides, and the service underwent a total change; but Parker's book, although written by a progressive officer, retains throughout the flavor of his first impressions. His second cruise was in the frigate *Potomac*, during the Mexican war. Here he saw all that went on in the squadron, and he took part in several of the more important expeditions. The operations on the east coast were not, however, those which reflected the most credit on the navy. The really successful work of the war was done by the Pacific squadron, which, under the brilliant leadership of Stockton, effected the conquest of California. In the Gulf, owing to the excessive caution or timidity of the commander-in-chief, Commodore Conner, the opportunities of the first year were lost, and the naval expeditions were generally failures, which the author makes no attempt to palliate. It was a melancholy, not to say exasperating, spectacle—that of a great naval force, fully equipped and almost unopposed, yet completely shackled by the fatal inability of an irresolute man to assume any risk or responsibility. It only came to an end when Conner withdrew and the command passed to his energetic successor, Commodore Matthew Perry.

After his return from Mexico, Parker served on the west coast of Africa, where a squadron was maintained for the suppression of the slave trade. On this cruise his vessel, the sloop *Yorktown*, was wrecked off the Cape Verde Islands. Later he sailed in the *Cyane* to the West Indies, and he was attached to the *Merrimac* on her first cruise in the Pacific. The outbreak of the rebellion found him on duty as an instructor at the Naval Academy, and he resigned his commission upon learning of the secession of Virginia, his native State.

During the first year of the civil war Parker commanded the gunboat *Beaufort*, in the sounds of North Carolina. His account of the disasters at Roanoke Island and Elizabeth city, and of the retreat to Norfolk, in all of which he took part, is graphic and spirited; and here, as everywhere, the story is enlivened by a flow of amusing incident and episode. The author never loses his sense of the comic, even in the most desperate situations; and he laughs, to borrow his phrase, "with the tear in his eye." The *Beaufort* arrived at Norfolk in time to join in the battle of Hampton Roads. Parker's narrative is the only one that we have seen which gives a full account of the services of the *Merrimac's* consorts during the first day's engagement. After the surrender of the *Congress*, the *Beaufort* went alongside, and in this position received the fire of the troops at Newport News, which compelled her to withdraw. Although the firing from the shore was not a violation of the laws of war, since the white flag at the mast-head of the *Congress* could not protect the enemy in his attempt to take possession, it resulted, in the author's opinion, in the loss of some of the wounded crew, who would otherwise have been transferred to the gunboat. During the action of the second day Captain Parker was a spectator. His conclusion, based chiefly upon Van Brunt's report, is that the victory rested with the *Merrimac:* "the *Monitor* withdrew first, and ran into shoal water—she gave up the contest." The conclusion, however, seems to be qualified in a later statement. "Whatever the cause," he observes, "candor compels me to say that the *Merrimac* failed to reap the fruits of her victory. She went out to destroy the *Minnesota*, and do what further damage to the enemy she could. The *Monitor* was there to save the *Minnesota*. The *Merrimac* did not accomplish her purpose. The *Monitor* did. She did it by resisting the *Merrimac* as long as she did, even if she did have to withdraw." It is now well known that the temporary withdrawal of the *Monitor* was due to the sudden disabling of her captain, and that, after a short delay, she returned to the *Minnesota*. As the *Monitor* was left in possession of the field, it is hardly correct to say that the *Merrimac* failed to "reap the fruits of victory": it does not appear that she ever had victory within her grasp.

It would be a pleasant task, if space permitted, to follow Captain Parker minutely through his experiences in the war—the attack of the rams upon the squadron off Charleston, where he served as first lieutenant of the flagship; the attempt to blow up the monitors in the Edisto, which was frustrated by the desertion of one of the torpedo-men; the organization of the school for midshipmen on board the *Patrick Henry*, in the James River; and the final retreat to Abbeville, after the evacuation of Richmond. The history of the Confederate Naval Academy has never before been written, and it well repays perusal. It will be long before Annapolis can furnish anything so singular and romantic. The midshipmen, while they attended their recitations and examinations, could hear day after day the booming of the enemy's great guns and the rattle of musketry. Their daily routine was pursued almost under fire. As the enemy's lines were drawn closer, it became necessary to seek a more peaceful neighborhood. All that was wanted, Captain Parker says, was "a pleasant cot, in a tranquil spot, with a distant view of the changing sea"; but it was hard to find. Finally, when Richmond was evacuated, the sixty midshipmen, "representatives of the best families of the South," were selected to guard the Confederate treasure—about half a million of dollars—in the retreat southward. After an arduous march of thirty days, in which they wandered hither and thither, to avoid the enemy's scouting parties, the treasure, on the 2d of May, was delivered to the fugitive President at Abbeville; and the midshipmen, weary and foot-sore, without hats or shoes, were "detached from the Naval School," and granted leave to visit their homes, with orders to report by letter to the Secretary of the Navy as soon as practicable. The author quotes the order to show his unwillingness to admit that the struggle was over; but he could not have written it without a full perception of its irony. The force was disbanded, with an allowance from the treasure of three weeks' pay for each man; the total amount being equal, as Captain Parker remarks in passing, to that received by several of the President's aides. A company from Charlotte, which had volunteered to assist the midshipmen in their journey, was offered a keg of cents—an offer which the men indignantly rejected.

Captain Parker's story is delightfully told. He is absolutely without art; he lays bare his opinions and feelings with the utmost frankness. It is clear that he is a thorough officer, a keen observer, and an impartial narrator; with a quick sense of fun, a kindly temper, and an irrepressible flow of animal spirits. The sensation that one gets in reading his book is like that of going out in a yacht on a fine morning, with a spanking breeze: everything is fresh and sunny and sparkling—and, above all, you are out for a lark. The narrative, from the first appearance of the boy of fourteen on the deck of the *North Carolina* to the parting at Abbeville after the collapse of the Confederacy, is steadily pursued, and the facts are told in a manly and straightforward way; but the author is always as ready to turn aside, even at the most critical moment, for a joke or a story as the midshipman of forty years ago was to skylark in the steerage. It is impossible to quarrel with him for these charming digressions, trivial though they may sometimes be. He fairly bubbles over with fun and good-humor; his stories are always good, and his comments upon men and things lose none of their pith and richness from being almost boyish in their ingenuousness.

It is particularly in that part of the book which deals with the civil war that one is struck by the impartial candor of its criticism. This is, if we mistake not, the only memoir that has been written by a Confederate naval officer, except that of Semmes on the cruise of the *Alabama*. Semmes wrote his book soon after the war, before the bad blood had passed off, and the vituperation on every page makes it wearisome reading. Its tone is little better than ruffianly. Captain Parker's 'Recollections' are the very reverse of this: he has not a trace of ill-feeling, and he speaks his honest convictions, without regard to friend or foe. He sees no reason in Semmes's complaint that the *Kearsarge* was an ironclad, and, with blunt directness, he characterizes Beauregard's proclamation of the cessation of the Charleston blockade as "all bosh." When, on the other hand, he jocosely invokes the shade of Sir Piercie Shafton over the utterances of Mr. Secretary Welles, there is no malice in his words, and one cannot listen to them without a perception of their justice. As a whole, the book has a sterling value, in the interest not only of truth, but of good feeling.

TOURISTS IN MEXICO.

Mexico and Her Lost Provinces, A Journey to Mexico, Southern California, and Arizona, by Way of Cuba. By William Henry Bishop. Harper & Brothers. 1883.

Mexico and the Mexicans; or, Notes of Travel in the Winter and Spring of 1883. By Howard Conkling. Taintor Brothers, Merrill & Co. 1883.

SEVERAL of Mr. Bishop's chapters have already appeared in *Harper's Monthly* and in the *Nation*. He retouches and adds enough to make a very readable volume of 500 pages. Considerably more than half of the book is devoted to Mexico, and to that part our review will be confined. Mr. Bishop describes himself as "a desultory traveller mainly in search of the

picturesque" (p. 94). While this declaration may serve to give his book a distinct place in the increasing catalogue of works on Mexico, it also leads him to write without a unifying plan. There is an undoubted charm in the way he makes statistics jostle descriptions of scenery, puts political reflections on the same page with character-studies, and groups history with anecdote, but it leaves one a little at a loss how to estimate the success or value of the book. It seems almost ungracious to find fault with the statements of a man who professes to be only painting us pictures. Yet we can admit the pleasure which his pictures give us, and at the same time help him to get them into a truer setting.

The Spanish of the volume needs attention. We have noticed "pronunciamento" (pp. 3, 124), "Vamenos" (p. 199), "Ayuntamienta" (p. 222), "Omeltusco" (p. 227), "Papagallo" (p. 284). Mexican vagaries in the confusion of sacred names are, we know, surprising, but we doubt much if even they could have transformed the famous Nuestra Señora del Pilar into the "Nuestro Señor del Pilar" which Mr. Bishop reports having seen (p. 247). There is a general and conspicuous disregard or misuse of the written accents. The sentence on p. 196 lacks three, and thereby makes nonsense. There are certain small inconsistencies in the book which witness to a careless revision. Mr. Bishop arrived in the country in the middle of April. He accounts for the clouds of dust he encountered in his ride up to the capital, across the plains, by saying, "We had come at the end of the rainy season" (p. 33). The truth is, it was the end of the dry season—which lasts, roughly, from October to May. Indeed, Mr. Bishop himself finds this out, and so tells us, further on (p. 213), but one would think his later knowledge might have corrected his early mistake, when once he set himself to publish his magazine papers in book form. At one place (p. 60) he gives the population of Mexico city as 250,000, at another (p. 83) as but 200,000. Such a variation would not be strange, in view of the utter uncertainty of the Mexican census, if the two contradictory statements had not been allowed to stand without an indication that estimates differ. Similarly, Monterey is, on one page (53), said to be on the line of the Mexican Central Railroad, while on p. 87 it is truly given to the Mexican National.

One serious error occurs on p. 140. The election returns in the Presidential contest of 1871 are said to show a total poll of only 12,361 votes, for a population of over 8,000,000. These figures are taken from a school 'History of Mexico,' written by Manuel Payno, and can be found on p. 246 of that work. They have been cited by others, for the purpose of making the same inference as that drawn from them by Mr. Bishop—viz., that there is no popular participation in the Mexican elections. The figures were cited and the inference drawn by Mr. John Bigelow, ex-Minister to Mexico, in the pages of *Harper's Monthly*, if we remember, less than two years ago. He was replied to, on this head as on others, by the Mexican Minister to our country, Don Matias Romero, who clearly showed that only an ignorance of the electoral system of Mexico could have found this statement of Payno's surprising. These 12,361 votes were the votes of electors, each one elected as the representative of a district containing 500 inhabitants. If our own average of one voter to every five inhabitants were true of Mexico, then these 12,000 "votes" would represent over 1,000,000 voters. That such a proportion of the population ever has voted in Mexico, no one believes. Probably a majority of the people do not know when the elections take place. The mass of those who do know are well assured that the whole business is such a farce that it makes no difference whether they vote or not. Mr. Bishop's inference that the elections are simply a cumbrous way of declaring the will of the administration is, no doubt, very near the truth, but it cannot be fairly drawn from the figures he adduces and does not understand. Payno, with recollections of Prescott, seems to have been our author's sole guide to Mexican history.

But these are small blemishes in a really excellent book. What with his admirable and characteristic sketches, his irrepressible American persistency in going to all places and seeing all things, in the face of alleged impossibilities, his close observation, Mr. Bishop has gone beyond any writer we know of in getting at "the actual heart of things." There are, for instance, two ways of seeing Mexico city: one is to stand on the hill of Chapultepec or Molino del Rey, at sunrise, when the soft halo of the rising mists, shot through with the slant rays of the sun, throws a glamour over the whole valley, and makes the city, with its dimly-seen domes and towers, seem a very gem on the bosom of that glorious plain; the other is to walk its streets, to see the filth, the disease, the misery—all the more pitiable for being half unconscious; to meet those throngs of half-naked Indians who cause pity to struggle with disgust in the beholder; to encounter on every hand the signs of corrupt and degenerate blood, impaired vitality, moral insensibility. Travellers have been too much given to using the former method alone. It was a fashion set in the charming letters of Mme. Calderon de la Barca, who lived in a continuous state of enthusiasm, natural in the wife of the first Spanish minister plenipotentiary sent to the Republic, received as he was with frantic delight as bearing the long-delayed recognition of independence from the mother country. But Mr. Bishop walks the streets, and does not content himself with standing on the hill.

We get a hint at the exactions, almost Turkish, of the Vera Cruz custom-house. One reason for these may not be generally known. The salaries of all officers, from the "jefe" himself down to porters, are fixed at a certain sum, plus a certain percentage of all fines imposed and confiscations made. It is not strange that there should be a general conspiracy to take the uttermost farthing from the helpless importer. The Government has learned its Spanish political economy well. It keeps up a tariff so high as to discourage imports, authorizes rates of transportation that strangle internal commerce, puts postage at a figure that forbids letter-writing.

Mr. Bishop's ride to Acapulco makes, perhaps, the most interesting part of his book, as his route lay so out of the ordinary. A gentleman who made the same journey, only in the reverse direction, some years before Mr. Bishop, gives a striking proof of the simplicity and poverty of the people of the interior. He sought out the American consul in Acapulco for advice as to the trip. That official advised him to take no silver for his personal expenses, except *cuartillas*—a coin worth about three cents. He invested $5 in money of that denomination, paid for his meals and lodging and the care of his horse, during a journey of thirteen days, and, on reaching Mexico city, found that he had still $3 worth of the three-cent pieces. For every service rendered, no matter what, the invariable charge was a *cuartilla*. The people knew no higher denomination.

To turn from Mr. Bishop's book to Mr. Conkling's is to turn from a series of pictures to a set of surveyor's charts. We get plodding compilations of Humboldt and Prescott, extracts from Government reports, statistics of mining and railroad interests—all, of course, of some value to those who have no access to the sources, but hardly of sufficient importance to justify the making a book out of them. Mr. Conkling seems to forget that Mexico is no longer the land "of mystery and romance" that it was when his grandfather was American Minister in that country. He describes for the fiftieth time scenes, buildings, customs, routes of travel, with the pleased air of one who is adding to our stock of knowledge. Add to this a style which is commonplace incarnate when it is not emptily declamatory, an observation which is not capable of striking deeper than the most superficial traits of character, an amusing, literal acceptance of the Spanish extravagances of his hosts, and one gets a very high potential of dulness. The book is to be credited with an unusual accuracy in point of fact and orthography, though this but intensifies the disappointment one feels on closing it; it seems as if one should have been able to bring down more than one or two petty little mistakes, after a hunt through such an arid and toilsome tract.

KOESTLIN'S LUTHER.

The Life of Martin Luther. By Julius Koestlin. Translated from the German. Edited by John G. Morris, D.D., LL.D. Philadelphia: Lutheran Publication Society.

In two recent numbers of the *Contemporary Review* Mr. J. A. Froude has called the attention of English readers to a 'Life of Luther' by Prof. Julius Koestlin, of Halle. He introduces his notice with these words: "At last we have a 'Life of Luther' which deserves the name; for such a biography Europe has waited till the eve of the four-hundredth anniversary of his birth." One would certainly gather from this language that the work thus noticed was a new contribution to literature, but Mr. Froude must, of course, have known that the volume he describes was the second edition of a book which appeared for the first time two years before, and that this book itself was only a meagre epitome in a popular form of the real Koestlin's 'Luther,' which has been in the hands of scholars for the last eight years.

The German epitome was, however, deserving of the highest praise. It was prepared with equal care and taste, containing the most telling portions of the original text, and made more interesting not only to the general reader, but to the scholar as well, by a multitude of illustrations, all of which were careful reproductions of contemporary originals. It gave, besides, a liberal selection of facsimiles of documents with translations. In a word, it was a model of a popular book in the best sense of that abused term.

It is from this abridgment that Doctor Morris has prepared the translation before us. He says: "It was thought eminently proper that the book thus noticed by the distinguished historian Froude should be put into the hands of English admirers of the mighty Luther, and it is accordingly presented to them." And this is the way he has done it: In the first place, he has dropped all the German illustrations and reproductions, and has added insult to the injury by saying that he did so because they were not adapted to American taste. In place of them he has substituted what he calls "some modern and artistically finished illustrations, which we are certain will secure the approbation of our patrons." These substituted illustrations are, with scarcely an exception, "borrowed" from those of Gustav Koenig, and have lost in the transfer the only merit they ever had, that of careful workmanship; the designs, feeble and absurd enough at the best, are here reproduced

in a style of art worthy of a child's primer of the last generation. To crown all, he has given us a portrait of Luther which, he tells us with a certain pride, is from an engraving in his own collection of Luther likenesses, made more than two centuries after the reformer's death!

We have dwelt upon these matters because they indicate the spirit which has governed the whole work. The translation, we are informed, was intrusted to several hands, in order to hasten its completion. No indication of the limits of each workman has been given, but, from a somewhat careful comparison of different portions with the original, we may say without harshness that the translation is characterized by an even badness, such as might have been expected in a book evidently thrown together in the greatest possible haste to catch the market while people are interested in the subject. We have enough bad translations of good books, but what makes this particularly exasperating is the condescension with which the editor explains all the feeble points as concessions to the depraved taste of American readers. It would be idle to point out special errors of carelessness and inaccuracy: they bristle upon every page, as any one who knows German may easily convince himself.

It is a relief to turn from the insufficient setting to the really brilliant picture it encloses. Never was a better illustration of the fact that no faults of presentation can wholly obscure the value of a truly great work. The original biography was the first of a series called "The Lives and Writings of the Fathers and Founders of the Lutheran Church." The plan of the series was to give not merely a biographical sketch of each man, but also a selection of his most important writings, so that the reader might hear him speak in his own tongue. In Koestlin the man was found who better than any other was fitted by his previous studies to undertake the biography of the great central figure about whom all the others were to be grouped. His book—we speak now of the original publication—is a masterpiece in its kind. An ardent admirer of Luther and a devout believer in the church system he inaugurated, Koestlin has preserved throughout the character of the impartial historian. He admits frankly that there are points in the character of the great personality he is dealing with which even his blind followers would find difficult to explain; but he undertakes to show how these defects were but the natural outcome of the situation in which Luther found himself.

It is easy for one looking back to convict any great leader of men of weaknesses and errors. We look at his problems in the light of later events, and we forget that he himself was feeling his way step by step in the dark, never quite sure whither the next move might lead him. And this was eminently true of Luther. Calvin at twenty-seven drew up a complete formula of doctrine and organization, from which as long as he lived he never departed, and which never passed through any essential changes. In his life there was no development. The problems which he found ready to his hand had been already thought out by Luther and the German theologians.

Luther, on the other hand, was called upon constantly to face in new forms the consequences of his own action, and it would be strange indeed if, in a time of ferment such as that, he should always have proved equal to the emergency. The wonder of the man is, that in so many cases he did rise to a clear understanding of the exact issue involved, and forced his opponents, friends or enemies as they might be, to recognize the force of his arguments or of his personality. He rose, almost from the first, to be the intellectual dictator of the serious reforming party. All questions of doctrine and of administration were referred to him; at times he was almost overwhelmed beneath the burden of these responsibilities. It is the best proof of the even balance of his mind that, in spite of his violent disposition, he succeeded so well in steering through the dangerous and shifting currents of the day.

If we think of him only as the man who posted his theses on the church door at Wittenberg, who burned the Pope's bull, who faced the Empire and the Church at Worms, we shall gain but a very inadequate idea of his activity. These were the moments when the world saw him flaming with the ardor of his conviction, and defying all the powers of earth in the name of a higher power, whose servant he believed himself to be. But when by means of this defiance the flame had been kindled, then came the still more arduous labor of so guiding it that it should purify and not destroy. The work of reorganization must follow after the work of destruction. There were others who could not rise to these new demands—men whose like are thrown up by every great social movement, and who could point to Luther as their leader, and demand that he should still lead them on into absolute liberty; but he saw from his retreat on the Wartburg whither these excesses must tend. He came down among them, and, by the simple force of the few great truths upon which he relied, succeeded in checking the mad current of radicalism. Again, in all the delicate questions regarding the relations of the Church to the civil power, his position was one of consistent conservatism. He had no desire to separate the Church from the state, nor to check in any way the control of the civil over the ecclesiastical body. The solution of the question, by allowing to every prince the right of reforming within his own territory, was not satisfactory to him. What he aimed at to the end was the final conquest of the truth over the sovereign of Germany, so that the reform he had at heart might have free scope in all the Empire. He counselled submission to the last, and it was a merciful fate which spared him the sight of his beloved Saxony overrun by imperial troops, the whole land engaged in a bitter struggle which his death had perhaps precipitated.

It was the hope of this ultimate victory of the truth over the hearts of men which caused him to resist so vigorously every proposal for an alliance with reforming parties who differed from him by ever so slight a shade in matters which seemed to him essential. At one moment it seemed as if an evangelical alliance between Lutherans, Zwinglians, and Calvinists might have swept all opposition before it. Luther steadily refused his consent, and the proposition failed. So in the years 1540–41, when moderate men on both sides fancied they saw the way for a reconciliation with Rome, it was largely Luther's opposition which caused the failure of the negotiations. Rome offered great concessions, but he could not be persuaded that they were made in any sincere spirit.

So with the internal organization of his church. It seemed to him a monstrous proposition that the congregation, as such, had any real rights. That seemed to him to smack of democracy and anarchy. He insisted that in place of the authority of the Pope, which had proved itself unworthy, there must be some other authority, and this he found in the state as head of the Church. The great principle of the right of the congregation we owe to the men whom Luther counted among his bitterest foes.

All this, and much more, has been for the first time clearly and consistently presented to the world by Julius Koestlin. His work, even in the mangled form in which it now lies before English readers, cannot fail to rouse a new and intelligent interest in the reformer in the minds of many persons to whom he has been heretofore but an honored name. It will serve an especial purpose in explaining to many why the celebration of the 10th of next month is now engaging the thoughts of men in all quarters of the Protestant world.

Colonies and Dependencies. Part 1, India, by J. S. Cotton, late Fellow of Queen's College, Oxford. Part 2, The Colonies, by E. J. Paine, Fellow of University College, Oxford. London and New York: Macmillan & Co. 1883. Pp. 164.

THIS little book, one of the series under the general name of "The English Citizen," edited by Professor Craik, is an admirable example of what may be done to bring large subjects within popular reach. Neither part is much longer than one of the more important articles of a cyclopædia, but each is so well digested and so tersely presented that it gives nearly all the ordinary reader would care for. Each is also the work of a thoroughly competent hand.

In the first part, India, with its vast extent, its hundreds of millions of people of different races, its complicated political system, its past relations to the English East India Company, and its present subordination to the British Government, is presented with so comprehensive a view as to make one wonder how so much can be crowded into so few pages without becoming a mere series of tables. Yet the narrative is interesting, and the history, though necessarily a sketch, is so well sketched that those who know most of Indian history will be likely to be most pleased with the manner in which the condensation has been done.

The second part, which deals with the British colonies and their relations to the mother country, is worthy of its predecessor. The classification is based upon the natural division of the colonies into those which, having a large preponderance of citizens of British stock, have the enjoyment of the quasi-independence known as "responsible government," and those which, being still chiefly inhabited by native tribes, are necessarily ruled as subject countries. The salient characteristics of each form of colonial government are rapidly hit off, giving to every careful reader a sharply defined notion of the policy of the British Government, and its effect upon the material and social advancement of the people of the colonies. The curious features of colonial history are also touched upon, such as the frank avowal of the reasons for withdrawing representative government from some colonies with their own consent, in cases like those of Jamaica and Natal, where the diminution of European residents in the presence of large bodies of African population had made the ordinary methods of representative government apparently impracticable.

A very interesting chapter is found in the relation of the colonial system to the British navy, and the contrast between the necessity laid upon the English Government to maintain an immense naval armament and the freedom from such a burden which the United States enjoys in its compact, though vast, territory, having such resources in itself that it could not be ruined "if all its ports were under perpetual blockade." The advantage this country has over the British colonies is fully stated, and the superior attractions offered to immigrants are by no means slurred.

The brief but lucid treatment of topics in both parts of the volume is such as to make the book even more fit for the shelves of a family library

here than in England; for it gives as much as an intelligent American will ordinarily take time to read on such a subject, while an Englishman might wish for a more detailed examination of themes so large in themselves.

Notes of Talks on Teaching, given by Francis W. Parker at the Martha's Vineyard Summer Institute, July 17 to August 19, 1882. Reported by Lelia E. Partridge. E. L. Kellogg & Co. 1883. Pp. 182.

So much has been said and written of late about education that very many people besides teachers have become deeply interested in the many new departures now initiated. One of the chief of these has been known as the Quincy method, of which the genesis was somewhat as follows: The author of this book, after having had a varied experience as a teacher and in the army, where he became brevet-colonel, went to Germany in 1872 for a two years' course of study in pedagogy and allied branches, and returned only to find himself still more at variance with the methods and ideas of teaching in vogue in this country, and especially in New England. At length, however, he obtained the ear and confidence of Mr. C. F. Adams, jr., through whose influence he was made superintendent of the public schools of Quincy, Mass. Here he introduced many reforms of more or less value, and after five years came to Boston as supervisor, whence he was called to the principalship of the Cook Co. (Ill.) Normal School.

This book is the first authoritative statement of the author's methods, and, indeed, the first attempt at a systematic "pedagogy," in the German sense of that word, which has ever been published in this country. There is a manifest trace of affectation, or a timidity about being taken seriously, in the title, 'Notes of Talks,' etc., for it is the matured and carefully-revised utterance of the writer upon the most weighty questions in common-school education. His fundamental position is that teachers must take their method from the child, whom they must constantly study and associate and sympathize with. His plea is for individualism in place of the rigid time-table and normal-school formalism in vogue in most of our large cities. What is the most *natural* way of learning numbers, reading, geography, etc.; how to teach life, and not school merely, is the constant quest. Those who do not know the ire that may fill the teacher's mind when the established routine of school-work is unsettled or threatened, can hardly conceive the bitterness of feeling that these ideas have engendered. Colonel Parker has been accused of every inconsistency and incoherence—of importing German novelties without adapting them to our climate; of ignorance, conceit, shallowness, and impracticability—to all of which he has replied in various ways from various moods. For ourselves, we like him best when he professes to be a simple man, without exactly the qualifications to grasp the vaster and higher problems of education, often mistaken, but ready to acknowledge error, and animated by a deep love of young children and of being instrumental in their mental and moral growth. This is his strength, and it is this, and not his public utterances, that has won him his many adherents, and kept him mainly right. He has done more than any one in this country hitherto to make it impossible for the teachers of the future to succeed without studying carefully and well, and by every means at hand, the minds and hearts of children, and to make it manifest to every unbiassed person that it is through this psychological work mainly, though not alone, that teaching can ever become, in any sense, a profession or a science.

This is not the place to enter in detail into the special topics of the book. The chapter on history is the worst and most inadequate, and those on reading, number, and moral training are perhaps the best. There is too little thoroughness and depth even here, and the value of the book would have been increased by references to literature for further reading in all directions. These, it is especially hoped, may be given in later editions of the book. Upon the whole, and despite the limitations suggested, and others which might be specified did space permit, the book is sound and its suggestions mainly in the right direction, and worthy the careful consideration of every public-school teacher in the country.

French and German Socialism in Modern Times. By Richard T. Ely, Ph.D. Harper & Bros. Pp. 262.

THE chief merit of this book lies in the fact that its author commands a clear style and understands the art of condensation. Writing, too, with an appreciative conception of the ideas of the great socialists, he has succeeded in presenting a series of short sketches well fitted to arouse popular interest. There are, however, many books already upon the market which resemble this one in form. Descriptions of the writings of Baboeuf, Cabet, Saint-Simon, Fourier, Proudhon, and the rest, are not at all uncommon. There is a certain poetry about these systems, and a certain romance connected with the lives which they led who propounded them, that provides good material for interesting narrative. Still, it is a pleasure to notice that Doctor Ely has not arrested his study with attention to those socialistic schemes that find their basis in philanthropic dreams, but carries his readers as well into the realm of social philosophy; and he has succeeded admirably, when one considers the short space occupied, in introducing to us the thoughts of Rodbertus and Marx, and in presenting the spirit of social democracy. It is this fact which rescues his book from the monotony of an oft-told tale.

If one were asked the number of American readers who know anything of Rodbertus Jagetzow, he could not safely place his estimate very high. Yet this man was the founder of "scientific socialism" and the intellectual father of Karl Marx. There are not a few European scholars who call themselves his disciples, and who hold his name in as high regard as the English economists hold that of Adam Smith. There is now lying on our table a book bearing the Leipzig imprint of the present year, on the title-page of which one reads "Bismarck, Wagner, Rodbertus, drei deutsche Meister." The name of Marx is better known, but of his thoughts the American public is most certainly ignorant. His reputation extends no further than this, that he was the founder of the Internationalists, yet in reality he ranks among the most searching of historical students and economic critics. In this book by Doctor Ely there are but ten pages devoted to the doctrines of Rodbertus, and seven to those of Marx; still, the reader can obtain some idea of the philosophic positions assumed by these men. All that here finds place is correct, and the selection is such that what is said is not distorted by the narrowness of perspective. One cannot, we think, close these chapters without wishing the author had presumed a little upon the interest with which his readers would follow him, and entered more into detail respecting these systems.

The discussions upon the early French socialists might well have given place for this purpose. They, in fact, belong to ancient history, and, though their systems occur in what is technically termed modern history, they do not at all represent the spirit of modern social agitations. One thing only of what they taught remains as a permanent part of economic thought, and that is their criticism upon the optimistic element in the doctrine of free competition as found in English economy. The basis of modern agitation, as of modern optimism, is entirely different. It is found in the law of social development which a study of history discovers, in the perfecting of a system of popular government which, it is believed, is now but half realized, in the modification of property relations through growth of law, in the transformation of industrial relations through organization among the oppressed classes—indeed, in a system of thought that is bold and well defined. It makes no difference where our sympathies lie; it is this thought that will give character to the history of our immediate future, and it is well that we understand it. It is a matter of regret, therefore, that Doctor Ely did not give greater attention to this part of his subject, and it is to be hoped that, having, as it were, filed a caveat by the publication of this little book, he will complete his task by a more extended portrayal of the theories of Rodbertus, Marx, and the modern socialists.

Animal Life: Being the Natural History of Animals. By E. Percival Wright, M.A., M.D., etc. With illustrations. London and New York: Cassell, Petter, Galpin & Co. 1 vol. large 8vo, pp. viii.-618.

POPULAR natural histories nowadays succeed one another with a rapidity which would astonish one who did not know how widespread, how almost universal, is the public interest in the subjects of which they treat, and how the demand for such books is fostered by the supply. The present treatise belongs to a large and increasing class, of very distinctive character. They are not text-books of science for professed students of zoölogy, nor yet story-books of animals for immature or uncultivated minds. They are not exhaustive treatises upon any special topic, even upon any particular branch, of zoölogy; nor are they written for specialists or even for scientists. They may be called modern "Cuviers"—not that they must be, or often are, from the hands of a great master of widely recognized or universal authority, but that they are the latter-day evolution of a 'Règne Animal' in spirit, scope, and purpose, however long the interval. They differ chiefly in being less technical and less authoritative—more popular and more attractive; in dealing less with the dead bodies and more with the life histories of animals.

At the head of this class doubtless stands Brehm's 'Thierleben,' published in numerous parts, making several volumes, and at this moment passing through a new edition. This is the basis of at least one of Cassell's publications, likewise in parts and making more than a volume. The same house is well known in connection with a number of books which fall in the same category. Then we have, in this country, S. G. Goodrich's 'Natural History,' to be classed with the foregoing in spite of the difference between Peter Parley and any sort of a "Cuvier." The best books of this class are not now usually the work of one author, a pretty high grade being assured by the engagement of a number of specialists to popularize the subject, each in his own department, as in the case of probably the best one of Cassell's books, that edited by Duncan and written by many hands. The same plan marks the 'Standard Natural History,' now publishing by Cassino in Boston, under the editorship of Coues and Kingsley. All such

works are, of course, profusely illustrated; they are also necessarily readable, or they would cease to exist.

If, now, we take a late edition of Cuvier—say the well-known one of 1849—we find a single portly volume of some 700 pages, fully illustrated, giving a compendious account, somewhat in the form of running commentary, of the animal kingdom, systematically arranged and classified according to the ideas of its author; the classes, orders, and families concisely defined, with genera and species enough remarked upon to illustrate the divisions established and the system proposed; with, however, a maximum of technicality to a minimum of readability, and continual insistence upon comparative anatomy. It is not all Cuvier, however; for the text of his editors—in this case Blyth, Mudie, Johnston, Westwood, and Carpenter—greets us on almost every page. Their business was to bring Cuvier down to date; the 'Règne Animal' was made a composite book by their labors; and such a volume as we have here sketched was, in 1849, incomparably the best view of the whole animal kingdom extant, for the purposes of any general reader and of many scientific students, though scarcely for any specialist. To-day, however, it is practically obsolete. We turn to it to see what used to be thought and said upon the subject, but we hardly study the subject from it any more than we do from Goldsmith's 'Animated Nature,' that extraordinary exhibition of genius and ignorance. The class of books above noted has entirely replaced alike the Cuviers and the Goldsmiths.

Doctor Wright's management of an Animal Kingdom may rank well among the good books of this class. It is not a Brehm, but then neither is it a Goodrich. It has the advantage of being a single volume of about the same bulk as the edition of Cuvier above noted; it is profusely illustrated with fair to excellent woodcuts, averaging, we should judge, at least one to every page. It is well planned and well written, and we think the author, under stress of the great condensation necessary to give any survey of the whole field in one volume, has shown much tact in elaborating those portions of the volume which most readers care most for, at the expense of the others. He need not have apologized for unequal treatment of some portions of the animal kingdom; for, as he says truly, "interesting stories about monads are not by any means as numerous as those about monkeys, nor have sponges as yet obtruded themselves upon our notice by assuming the impertinent physiognomies or intrusive habits of sparrows."

So it falls out that about one-third of the whole volume is devoted to mammals; less than as much to birds; to reptiles and fishes together only about as much as to birds; and to all the rest of the animal kingdom about as much as to birds. The book is of about the bulk of the 1849 Cuvier, and we fancy contains about as much matter; while the apportioning of space to the several classes is approximately similar, though only about half of the 'Règne Animal' is occupied with vertebrates. The treatment is systematic and consecutive, and there is enough technicality to ballast the pronounced popularity; the classification is fairly up to the times; the descriptions of animal life, when not original, are drawn from trustworthy sources, and are credible as well as readable. On the whole, we do not see why we may not say that Doctor Wright has produced in one volume a very acceptable modern "Cuvier" for the general reader, and especially for the rising generation.

Canaries and Cage-Birds. By Geo. H. Holden. New York: Published by the Author. 1 vol. large 8vo, pp. 364.

THIS is primarily an advertisement of the author's business, that of an importer and dealer in cage-birds; but it is not only an advertisement—it is the outgrowth, apparently, of a much less pretentious treatise of similar character, Holden's 'Book of Birds,' which we believe went through several editions, and must therefore have had sufficient reason for being. The present form of the publication is designed to be a help to those who keep birds for pleasure or breed them for profit. The usual assortment of cage-birds is passed in review, the greater part of the space devoted to each being occupied with practical directions for feeding, rearing, and otherwise caring for them. No pretence of literary style is made, but the book should be readable for those who fancy birds, and as it conveys the views of one whose experience is certainly mature, and who knows very well what he has written about, it should accomplish its aim to be a real help to birdkeepers. Some of the facts given and stories told, especially about bird-buying and importing, let the reader into some curious trade secrets. Canaries hold the leading place, and the bullfinch is particularly well treated, a number of "bullfinch melodies" being given in musical notation. The articles on parrots, finches, wrens, the mocking-bird, and various others of our native wild birds, are extended, and directions for mating and rearing various exotic species not often bred in this country are given. There are many illustrations, including several colored plates, which, though recognizable without exception, cannot be praised as works of art; some black full-page cuts, extremely coarse and hard; but also a number of figures in the text of much better average quality, some being fine portraits, and others spirited sketches. The book is a composite rather than a composed one, but lacks neither pictures, poetry, music, readability, nor usefulness as claims upon our attention.

Modern Spanish Readings. Embracing Texts, Notes, and Etymological Vocabulary. By William I. Knapp, Professor in Yale College. Boston: Ginn, Heath & Co. 1883.

THIS is a series of prose readings—one page of "Versos" excepted—each complete in itself, and all composed in the language of contemporary Spain, as used "in good society, . . . in the journal, the review, and the latest work of fiction." The pieces given are thirteen in number, interesting historical matter occupying most of the space; and among the authors represented are Maria José de Larva ("Figaro," died 1837), Javier de Burgos (d. 1847), Lista (d. 1848), Juan Donoso Cortes (d. 1853), Lafuente (d. 1866), Cecilia Böhl de Faber ("Fernan Cavallero," d. 1877), José Selgas (born 1824), and Emilio Castelar (b 1832). The "Notes" are copious, being explanatory not only of idiomatic phrases, grammatical forms, or peculiarities of construction, but also of historical, geographical, and biographical points and allusions. Some are exceptionally full—we may say, more so than needed—as, for instance, when, in explanation of a purely incidental mention of "la batalla de Talavera," we are told when and by whom the battle was fought, after whom the town was surnamed "de la Reina," in what condition it is now, that it is famous as the birthplace of Juan de Mariana, when this writer lived, and where and by whom the first edition of his 'History of Spain' was published. The "Vocabulary" occupies almost half of the 450 pages of the book, and is fully accented and very lucidly done. Its etymological indications form a very meritorious feature, though "space was wanting to develop the popular Latin forms out of which Spanish words grew," the author "being able in most cases merely to drop the key-word, or a suggestion." In his conclusions as to derivations he occasionally differs from the great authorities on the subject, such as Dietz or Dozy, and for some deviations he states his reasons. Thus, for instance, he rejects the common derivation of *Don* from *dŏmĭnus*—"which makes legally only *dom'no*, and by assimilation of the *m*, *donno*, whence regularly *dueño* (cf. *somnus*, *sonno*, *sueño*), and *domĭna*, *dueña*"—and he derives it from the Phœnician (and Hebrew) *ādōn*, lord. But if the Phœnicians introduced *Don* and *Doña* and Port. *Dom* and *Dona* into the Spanish Peninsula, from whom have the Italians received their *donna* (obviously = *domino*)? Professor Knapp, in comparing "the other Romance nations," forgets this Italian word.

BOOKS OF THE WEEK.

Arnold, E. Indian Idylls, from the Sanskrit of the Mahâbhârata. Boston: Roberts Bros. $1.
Brehm's Thierleben. Chromo ed. Parts 99-104. B. Westermann & Co.
Bullock, A. H. Addresses Delivered on Several Occasions, with a Memoir by G. F. Hoar. Boston: Little, Brown & Co.
Bulloch, J. D. The Secret Service of the Confederate States in Europe; or, How the Confederate Cruisers were Equipped. 2 vols. G. P. Putnam's Sons. $6.
Byron, Lord. Complete Poetical and Dramatic Works. Newstead ed. Philadelphia: E. Claxton & Co. $5.
Cary, Alice. Snowberries: a Book for Young Folks. Illustrated. A. C. Armstrong & Son.
Cary, Alice. Clovernook Children. Illustrated. A. C. Armstrong & Son.
Cobbe, Frances Power. Religious Duty. Boston: Geo. H. Ellis. $1.
Daudet, E. French Celebrities. Funk & Wagnalls. 15 c.
Dramatic Works of Richard Brinsley Sheridan. With an Introduction by Richard Grant White. In three volumes. Dodd, Mead & Co. $15.
Fernow, B. Documents Relating to the History of the Early Colonial Settlements, Principally on Long Island. Albany: Secretary of State.
Hatton-Harvey. Newfoundland: its History, its Present Condition, and its Prospects in the Future. Illustrated. Boston: Doyle & Whittie. $2 50.
Hudson, W. H. Sea-Sickness: its Cause, Nature, and Prevention. Boston: S. E. Cassino & Co. $1 25.
Mollett, J. W. Watteau. Scribner & Welford.
Pelletreau, Rev. C. Reminiscences of the Seventh Regiment N. G., S. N. Y., in State Camp, June, 1883. A Book in Verse. Thomas Whittaker.
Prince, L. B. Historical Sketches of New Mexico, from the Earliest Records to the American Occupation. Leggat Brothers.
Smart, H. Two Kisses. Philadelphia: T. B. Peterson & Bros. $1.
Trollope, A. Autobiography. Harper & Bros. 20 cents.
What Became of Eugene Ridgewood? A Novel. G. W. Carleton.

The Nation.

NEW YORK, THURSDAY, NOVEMBER 1, 1883.

The Week.

THE leading Independent Republicans of Pennsylvania have issued an address to their party or wing—whichever one likes to call it—in that State, urging their followers, now that they have succeeded in imposing the reform of the civil service on the political managers, and that a complete change in the political situation has thus been effected, to consider what "line of action promises the most efficient support to civil-service reform." It then goes on to recommend them to support the Republican party, on the ground that "any permanent improvement in our political methods and public life" is to be expected from that party only. The same thing may be said to the Independents in this State. Nobody who has read the Democratic papers and listened to the Democratic orators during the past year, can fail to see that the change in public sentiment about either civil-service or any other reform has not made the least impression on their party, and that there is nothing which makes it so eager for a return to power as the hope of seizing the offices again and using them as "spoils." Hardly one word of real encouragement do reformers receive from them, and if they get hold of the Government again, it appears pretty clear that the reform work of the last fifteen years will have to be done over again, by a new generation.

The combat in Massachusetts deepens as the election day draws near, and is made more exciting by occasional single combats under the eyes of both armies. The latest and one of the most deadly is between Mr. F. B. Sanborn and Wendell Phillips. Mr. Phillips is a supporter of Butler, and of course a rabid one. He was instrumental, it appears, in getting Miss Chevaillier appointed a Butler delegate, with Flower, the quack doctor, to the Louisville Charity Conference. It also appears that she is a Southern woman, and has been writing to Southern friends, as such, that she is engaged in the great work of exposing Massachusetts "hypocrisy," "Phariseeism," "cruelty and barbarism." Sanborn challenged Phillips to know if he was responsible for her, and got a characteristic letter in reply. In one to Miss Chevaillier he speaks of the opponents of Butler as "fractious rebels" against their Chief Magistrate. Sanborn calls this the talk of the "barber surgeon" of an Oriental despot, and the Governor "the Massachusetts Yahoo," and intimates that Phillips, once "the champion of a noble cause," is now

> "Eyeless in Gaza at the mill with slaves,
> Himself in bonds under Philistian yoke."

In fact, matters look very serious in the State on every side, and all the leading men are handling their opponents without gloves. Butler continues through the crisis to lie like clockwork from town to town, and the Republican papers chase him somewhat ineffectively, because his new lies come so rapidly that the public interest in the old ones is gone before they are exposed.

There has been a good deal of absurd talk among the negroes about the late Supreme Court decision, which indicates in some cases great ignorance of the nature and functions of courts of law. On the whole, however, it seems likely to turn the attention of the colored population in the matter of protection for their civil rights in the true direction, namely, to the government of the States in which they live. When the Congressional Civil-Rights Bill was passed, few supposed that within ten years the negro voters of the South would have it in their power to make themselves felt at State elections. As a matter of fact, however, there is hardly a State today in which their support, properly managed, is not worth courting by one or other of two parties. In Virginia, in particular, they are literally masters of the situation, if they choose, and will do good service, if, as they now threaten, they compel their leader, Mahone, to do something for them besides cheating the State creditors and debauching the public service by office-jobbing at Washington. Mahone's Legislature has in its possession all the civil rights there are in the State, and it ought to be compelled to divide them equally between the two races.

On last Saturday the Banks County (Ga.) Kuklux were found guilty by a jury in the District Court of the United States for the Northern District of Georgia. It will be remembered that last July several negroes in Georgia were visited by masked men in the middle of the night and most cruelly beaten. Both the State courts and the United States courts proceeded at once against the eight men who were alleged to be engaged in this atrocious crime. The latter claimed jurisdiction, upon the ground that the outrages were committed upon the parties because of their vote in the last Congressional election. The evidence was clear that the negroes were barbarously whipped by eight men who were identified with the prisoners. But it was not clear that the negroes' manner of voting had had anything to do with the whipping, which seems, indeed, to have been motiveless. The prisoners were little better than cowboys in their civilization, and all of them were quite young, the majority of them not being twenty-one years old. It is more easy to believe that the act was one of wanton brutality than of political rancor, when it is remembered that the Congressional election had long since been held, and that the candidate for whom these Kuklux voted was victorious. The verdict, at any rate, will give general satisfaction. The people of Banks County in particular have already expressed their denunciation of the crime in a mass meeting held shortly after it was committed.

Mr. W. D. Kelley furnishes some very doleful opinions on the condition of the iron industry in Great Britain, and the low wages and distress of her operatives, in a *Herald* interview. When the evil-minded reporter asked him what opinion he had formed in the course of his journey as to the situation of iron-workers at home and abroad comparatively, he said: "You may well believe that I have come home a more intense protectionist than when I went away." This, we submit, was hardly a fair answer to public curiosity. That the iron trade of Great Britain is in an unsatisfactory condition is well known, but the decline in production has not been nearly so rapid or disastrous as in the United States. According to the last report of the American Iron and Steel Association, there were only 340 furnaces in operation in a total of 705. Three hundred and sixty-five furnaces were out of blast on the first day of October, and their operatives were not earning even the small pittance which moves Mr. Kelley's pity for the British iron-worker. The truth is that the capacity for making iron in the United States is more than twice as great as the demand for iron in this country, or in any part of the world where we have a chance to sell. The capacity of England for making iron is somewhat, but not greatly, larger than our own, but she has the enormous advantage over us that her market is coextensive with the boundaries of the earth. We can see no prospect of a revival of the iron trade in the United States, and especially in the Eastern States, which does not look to a foreign outlet. It will be much more to the purpose for Mr. Kelley to show how the 365 dead furnaces are to be relighted, than to bewail the low wages of the iron-workers at Merthyr-Tydvil.

The *Christian Leader*, while greatly admiring Mr. Matthew Arnold, has had his "image marred" in its mind by "the mercenary proclamation of his purpose in seeking our shores." This means that Mr. Arnold has said frankly that he has come here to lecture, and expects to be paid well for it. If this mars his image in the *Leader's* mind, what a condition the images of Thackeray and Dickens, of Wendell Phillips, of Dr Chapin, of George William Curtis, of Emerson, of Carlyle, of Freeman, and scores of other eminent men, must be in. They all lectured for money, and made no secret of it, and used the money unblushingly in such ways as providing for their families, increasing their own income, paying their debts, and so forth. The *Leader* must not fall into the too common error of expecting anybody one admires to work for nothing. Even ministers are not above taking a good salary, and their doing so is not held to mar their preaching, and it should not mar their images. What does it think of the long and successful mercenary lecturing of its own Dr. Chapin? The fact is that one object of Mr. Arnold's visit is to open up such minds as the *Leader's*, and stop any improper image-marring there may be going on inside.

Lord Coleridge on Friday, at Yale College, took part in the old controversy about the value of the classics as a means of college education. His remarks were apparently suggested by the recent attack on classical training by Mr. C. F. Adams, jr., and he defended it on the ground that it had been of great use to him, and must be of great use to any one who has to speak or write, and therefore needs to know the art of persuasion, which consists so largely in style, arrangement, and logic. This, however, was rather an answer to Professor Huxley, and others of the scientific school, than to Mr. Adams. It is true that the latter made some very depreciatory remarks on the Greek orators and historians, but his main objection to them as college text-books was not that they could not do him any good, if he understood them, but that his University never taught him to read them. So that on the whole his discourse was rather a criticism of collegiate methods than of the classical curriculum. Lord Coleridge's testimony, being that of a man who knows Greek and Latin, is of much more value, therefore, than Mr. Adams's, which was that of a man who confessed he had never really learnt them at all. It confirms, too, remarkably what we said about the matter two months ago, viz., that classical training, like every other kind of training, was sure to be useful to a man who got it, but that, of course, to a man who never got it, it could not possibly be of any use whatever. Indeed, Mr. Adams's address might, *mutatis mutandis*, be used as a very good argument against scientific training; for that science does nothing for the mind of a man who learns no science, is as plain as a pikestaff.

It must not be said in answer to this that Lord Coleridge comes from a university in which the classics are taught more effectively than they are taught at Harvard and Yale, and that he is an example of what better university methods might do in making the classics a means of useful mental culture. The truth is that the classics, like most other things, are taught in much the same way in all of the leading universities—that is, they are well taught to those who are willing to learn, and poorly taught to those who are not. In nine cases out of ten, young men leave college in a state of ignorance simply because they did not give their mind to their work. For this unwillingness to study there is no college remedy under the sun. The notion that the men who graduate without knowing Greek would, if German or French were substituted for Greek, graduate with a thorough knowledge of this useful modern tongue—which was part of Mr. Adams's thesis—is one of those comforting fictions which it is somewhat cruel to attack, but it is nevertheless a fiction. They would graduate with about as much German and French, or science either, as Greek or Latin. Everybody has a little fiction of this kind about his youth which sustains and consoles him, when he journeys through life under the inconvenience caused by his own deficiencies. Sometimes it is his father, sometimes his mother, sometimes school, and sometimes college that did not do the right thing by him at the right time.

The arrival of Father Hyacinthe will recall to many of our readers the flutter of excitement into which his last visit, fourteen years ago, threw the religious world, and will set them reflecting, too, on the smallness of the results of his defection from the Roman Church, of which he was so bright an ornament. When he quarrelled with her he was one of her most powerful and persuasive preachers, and was expected to exert great influence in resisting the Infallibilist craze of Pius the Ninth and his Council. But nothing, or less than nothing, has come of it all. It is not worth while to discuss the causes of this now. Some of them have been special and some general, and it must be said that Father Hyacinthe has fared no worse in this respect than greater theologians, such as Döllinger. His failure teaches several things, of which the most prominent is that in our time it is not possible to start a new religious movement or found a new sect that will succeed, no matter how absurd or overbearing orthodoxy may become; and the reason is that there is not enough popular interest in dogma. If the Vatican Council had made it an article of faith that the earth moves round the moon, it would have done the Church but little harm, simply because unbelievers are lazy and do not care. Anybody who seceded because he did not believe it could not have got enough dissenters to go with him to pay the expenses of "a hall" to protest in. In fact, anybody who has got a good place in the Church in our time cannot, as far as influence goes, do better than stay there.

Judge McCrary, in the United States Circuit Court, at Des Moines, Iowa, has decided that the Iowa law of 1874 could not operate so as to limit railroad charges between two points, one of which is in another State, holding that if the State could fix charges on lines outside its own limits, it would be an infringement of the right of the United States to regulate inter-State commerce. It would, moreover, he said, enable one State to discriminate against the commerce of other States. This decision, if sustained, will of course make all coming granger laws, if any should be passed, very ineffective, because it leaves the power of railroads over through-freights practically untouched. The greater part of railroad freight business, in the West particularly, comes under the head of inter-State commerce. The decision has no special importance for the Iowa people, however, because they have repealed the law under which the suit was brought.

The retirement of national-bank circulation, although it has not yet reached serious proportions, has created a feeling of uneasiness in business circles which will inevitably spread through the country unless the causes which lead to the contraction are removed by efficient legislation. The retirement of circulation is due to the calling in of the 3 per cent. bonds and to the high price of the 4's. The easiest, cheapest, and simplest remedy, as we have heretofore pointed out, would be to repeal the 1 per cent. tax on circulation, which is no longer needed for revenue purposes. The tax yields only $3,500,000, while the collection of it renders the whole bank circulation unstable. The burden falls almost wholly on the country banks, since the banks of the large cities have very little circulation. The tax on deposits, which was removed at the last session of Congress, was, on the other hand, a relief to the city banks, in which those of the small towns participated only to a trifling extent.

There is another measure, however, which would relieve the pressure on bank circulation, and which is open to no objection either political or financial. The Government allows a bank to issue only $900 circulation on a bond of $1,000, whether the market value of the bond is par or 22 per cent. above par, and requires 5 per cent. to be deposited at Washington in money as additional margin. This is really a margin (in the case of the 4 per cent. bonds) of 37 per cent. exacted by the Government at a time when private lenders require only 5 or 6 per cent. margin on the same kind of security. There is no reason why the Government should not allow the issue of notes to the extent of 90 per cent. of the market value of the bonds held as security, reserving the right to call for additional security if the market price declines. The idea which Congress had in view in passing the National Bank Act was merely to keep the margin of security equal to 10 per cent., but the margin has enlarged itself by the appreciation of the public credit in a manner not anticipated when the law was first enacted. If security is the sole consideration, there is a manifest incongruity in exacting only 10 per cent. margin in the case of one class of bonds, 18 per cent. in another, 22 per cent. in another, and 32 per cent. in another—all of these percentages being augmented by the 5 per cent. cash deposit at Washington. By repealing the tax on circulation and fixing the margin of security at 10 per cent. of the market value of the bonds, the stability of the national-bank notes might be secured for at least twenty years. In order to meet the gradual lessening of the premium on the 4 per cent. bonds as they approach maturity, it would be proper to require the banks to deposit 1 per cent. per annum of bonds, or retire an equivalent amount of circulation. The existing tax on circulation might be safely commuted in this way.

The very low price of wheat in Chicago (about 93 cents per bushel) has led to a general revision of estimates both as to the quantity of the crop on this side of the Atlantic and the extent of the demand abroad. The course of the market during the past month would seem to prove either that the yield had been underestimated or the foreign demand overestimated, or both. It is a very rare thing for wheat to fall below $1 in the Chicago market, and when it does we must assume, whatever the statisticians tell us, that the supply is in excess of the demand. The very opposite condition had been anticipated for a period of nine months—that is, from the time when a large area of winter wheat was reported to have been killed by frost. The most commonly received estimate of the year's yield at the

present time is 400,000,000 bushels. This is 59,000,000 bushels less than the yield in the census year.

Mr. Dudley, the Commissioner of Pensions, is pursuing with commendable vigor the gang of swindling claim agents who have been operating for many years in Washington. Their infamous performances have been exposed many times, but for some reason or other they have been allowed to go unpunished. The law provides ample penalties for their offences, and there is now a prospect that some of the worst of them will be brought into court and punished. District-Attorney Corkhill, an official who is never precipitate in his movements against criminals, has at last become so much aroused by the complaints of pensioners who have been robbed that he has determined to bring the matter before the Grand Jury. He says the character of the enormous frauds perpetrated by certain claim agents will, if the allegations made are sustained by the evidence, surprise the public. "The devices employed are," he says, "as numerous as the skill of dishonest men can contrive." There is nothing surprising to the public in that statement, for its truth has been demonstrated by repeated exposures during the past few years.

The stockholders of the Keely Motor are again restless, and talk of suing the inventor. But no good can possibly come of suing him. His means are all in the machine, and not only can nobody work the machine but himself, but apparently nobody but himself can understand it. Indeed, this last fact seems to constitute an insurmountable bar to bringing him under the operation of the powers of a court of equity. A judge might order him to explain his invention to his stockholders; but this would do them no good as long as there was no mind capable of receiving the explanation. The thing to do now is to train some bright boy in such a way as to make his understanding a fit receptacle for the Keely secret. In the meantime the stock will do, like a good many other stocks, for speculation. A stock is not wholly useless because there is no property behind it.

Another professor has seceded from the Cincinnati College of Music, and the functions of faculty and director are now snugly consolidated in the person of the President, who is not in any sense a musician. The institution has thus reached the position which its founders have been trying for many years to bring it to. They made the mistake at the outset of putting the College into the hands of a lot of musical enthusiasts, who would not be brought to see that the commercial success of the institution was of greater importance than the establishment of a high artistic standard. The result was that when they supposed they had opened a shop for the retailing of musical instruction, they discovered that they had a director and faculty who were fanatically devoted to art without regard to pecuniary profits. A quarrel began at once, and at regular intervals one of the "musical cranks" has been got rid of, his departure in each instance being announced as due primarily to his infirmities of temper, which made it impossible for the President to get along with him. The last member of this troublesome faculty departed on Saturday, and with him the last purely artistic influence which was left of the institution as originally opened. The famous musical critics of the place, also, are apparently moving to New York and bringing their apparatus with them. We have no doubt that, now that it has been freed of its discordant elements, the College will flourish and become—what it has all along been aiming to be—a "big thing for Cincinnati."

The *Herald* correspondent at Constantinople telegraphs, in what purport to be Mr. A. S. Hewitt's exact words, an account of an interview of that gentleman with the Sultan which, if correct, is very amusing reading. Mr. Hewitt certifies that the Sultan is a man of great intelligence, but that his intellect is of a "metaphysical order," given rather to analysis than to generalization. If this be true, he must also be a wag of no mean powers, for he observed to Mr. Hewitt that the stability of American institutions was due to the "absence of politicians," from "a superabundance" of whom France suffers so much. This is not bad for a man of a metaphysical turn. But it was not so good as his attempt to persuade Mr. Hewitt that "perfect religious freedom prevailed throughout the empire," and that the followers of all creeds were equally protected by law. His remark that he understood that Mr. Hewitt was likely soon to become a member of the Government, was probably an attempt to start a Hewitt "boom." There was something pathetic in his assertion that the United States "harbors no designs and pitfalls" against his empire, considering that General Wallace has been trying to impose a free-trade tariff on him, or, in other words, to ruin the poor man by pouring in on him the products of our pauper labor.

The attempts of the Land-Leaguers in Ireland to carry their agitation into Ulster are plainly to be baffled by force. The Orangemen have announced the intention of attacking their meetings, and the Government will probably forbid the meetings on the ground that they are unable to protect them. The situation is complicated by a ferocious letter of Lord Rossmore, who is an Orange Grand Master, or something of that sort, in which he announces in plain terms that the Orangemen will shoot the Land-Leaguers if they try to carry on their treasonable agitation, as he considers it, in the North. The letter is undoubtedly an incendiary one, and exposes the writer to prosecution under the Crimes Act; and he ought to be prosecuted, but probably will not be. But if he be not prosecuted it will weaken the position of the Government in dealing with crime or disorder on the other side. Nothing could, in the present state of Ireland, be more unfortunate than any sign of favor or toleration for the Orangemen, who can hardly be called a political body at all, or indeed a body having any modern political opinions. They are an organization for perpetuating the ferocious religious hates of the seventeenth century, and seek nothing in the way of political change but the persecution of some of their countrymen on the ground of religious belief.

The French Ministry have received a terrible blow in the publication of the latest despatch of the Chinese Ambassador, who for some inscrutable reason is called the "Marquis" Tseng. Their Yellow Book, which they have presented to the Chambers, contains as much of their correspondence with him as they judged it best to show, and it makes the Chinese appear to be getting the worst of it. But Tseng's despatch is said to show that he has never made them the slightest concession, and is, indeed, not prepared to concede anything they care for beyond a few ports on the coast; and, what is more serious than all, that China seems ready and willing to fight. It is now said she can throw 50,000 well-armed and tolerably drilled troops down into Tonquin, who can give employment to, say, at least as many Frenchmen. More unwelcome news for the Ferry Ministry could hardly come. A curious illustration of the very mixed-up condition of the French mind on the whole matter may be found in the articles of the eminent financier Leroy-Beaulieu in his paper the *Économiste Français*, in which, often in the same column, he draws a most dismal picture of the condition of the French finances, and clamors for the vigorous pushing at the same time of all the crazy colonial enterprises, including that of Tonquin.

The Emperor Francis Joseph, in receiving the Delegations for Common Affairs of Cisleithania and Hungary, now convened in Vienna, was quite emphatic in enunciating peaceful intentions toward all Powers, and his conviction that the people of every country felt strongly the need of tranquillity. Count Kálnoky, the Austro-Hungarian Minister of Foreign Affairs, has twice proclaimed similar views on occasions offered by the Delegations, each time expatiating on his Empire's relations with Russia. The organ of the Russian Foreign Office, the *Journal de Saint Pétersbourg*, readily chimes in with reciprocal sentiments, declaring that the diplomacy of M. de Giers is entirely devoted to the maintenance of peace, and that there is no question now pending that is likely to disturb the quiet prevailing in Europe. This declaration is uncommonly kind, considering that Russia has just suffered both checks and affronts in her dealings with the States of the Balkan Peninsula, Ruman and Slavic, which owe her their independence, or semi-independence. But is it as sincere as generous? Count Kálnoky, unfortunately, on one occasion hinted at armaments in Russia, in spite of which the peace of Europe appeared to him unmenaced; and his Emperor demands of the united Delegations additional appropriations both for the carrying out of reforms in the army and the formation of reserves. At the same time reports of Russian army concentrations on the western borders of the Empire are repeated in German newspapers with growing positiveness.

SUMMARY OF THE WEEK'S NEWS.

[WEDNESDAY, October 24, to TUESDAY, October 30, 1883, inclusive.]

DOMESTIC.

PRESIDENT ARTHUR on Saturday issued a proclamation designating Thursday, November 29, as a day of national thanksgiving.

The Utah Commissioners had an interview with the President on Friday. They are divided in opinion whether they shall recommend a government for the Territory by a legislative commission, or by a commission like that in the District of Columbia. There is no difference of opinion as to the fact that polygamy cannot be destroyed under the Edmunds law, yet they are disposed to give that law more credit than it has generally received. They submitted their report to Secretary Teller on Tuesday. In it they intimate that if the Mormon Legislature shall not act in good faith, and enact suitable legislation to carry out the Edmunds law, the Commissioners will recommend to Congress the passage of the severest laws possible under the Constitution.

The Secretary of War has received Lieutenant Garlington's answers to the questions asked him by General Hazen after the receipt of his (Garlington's) report of the expedition to Smith Sound, for the relief of Lieutenant Greely's expedition. He explains that he did not leave any of his boats for Greely's use, because "to have left one of the *Proteus's* boats, or to leave one of my whale-boats and distribute my surplus men in the *Proteus's* boats, a resort to force would have been necessary, which I was not prepared to make for the questionable benefit of leaving a boat. Lieutenant Greely has eight boats available on the west coast and another on Carey Island." After answering other criticisms, he requests that a court of inquiry be appointed to investigate the whole case, if his explanations are not satisfactory.

General Hazen, the Chief Signal Officer, expresses the belief that Lieutenant Greely is safe, and that his party will survive the winter.

Secretary Teller and Mr. Dudley, Commissioner of Pensions, are making war upon pension agents suspected of unlawful acts. A number have been suspended from practice until they can disprove the charges against them.

The report of the Superintendent of the Money-Order Bureau of the Post-office Department, for the fiscal year ended June 30, 1883, contains the following figures: The total number of money-order offices on June 30 was 5,927. The number of domestic money orders issued during the year was 8,807,556, of the value of $117,329,406. The number of orders paid was 8,602,625, and the value of those paid and repaid was $117,344,281. The increase in the value of the domestic orders issued over those issued during the preceding fiscal year was $3,955,980, or 3 46–100 per cent. The report also shows that the postal note has been extensively used by the public since the inception of the system.

A statement prepared for the use of the Post-office Department shows that the total receipts from the postal service during the fiscal year ended June 30, 1883, were $45,508,692. The expenditures were $42,816,700; surplus, $2,691,992.

The Star-route scandal was revived on Thursday in the Supreme Court Chambers, in this city, before Judge Barrett, in an action brought by John A. Walsh against Thomas J. Brady. The matter came before the court upon a motion to vacate an order which had been granted for the examination of Brady before trial. The motion was granted because the affidavit did not show that the evidence of General Brady was material and necessary to enable Mr. Walsh to frame his complaint. A similar order against ex-Senator Kellogg was also vacated.

When the Circuit Court met in Washington on Tuesday, the case of Hallett Kilbourn against John G. Thompson, ex-Sergeant-at-Arms of the House of Representatives, for $350,000 damages for alleged false imprisonment, was taken up.

The indications are that the new railroad-time standard will be approved by the Government.

Rear-Admiral Crosby, of the United States Navy, commanding the Asiatic station, has asked to be placed on the retired list under the forty-years' service law. The request has been granted, and on Monday Commodore John Lee Davis was selected by the Secretary of the Navy to succeed him in command of the Asiatic squadron.

General Crook telegraphed from San Carlos, Arizona, to the War Department on Wednesday: "Two Chiricahuas men and one boy came in to-day, and report that they left the Chiricahuas camp, near Casa Grande, nineteen days ago, and that all the remainder of the Chiricahuas left behind in Mexico were to leave their camp for San Carlos the next day."

An indignation meeting of negroes was held in Chicago on Wednesday night, to protest against the recent decision of the Supreme Court against the Civil-Rights Bill.

The American Iron and Steel Association has received statistics showing considerable falling off in imports of iron and steel from Great Britain. The imports of these products last month footed up 55,144 tons against 66,633 tons for the previous month. The total imports for the nine months of this year were 540,079 tons, while for the corresponding period last year they were 950,905 tons.

In the West the war of freight rates is extending. On Thursday the agent of the Central Pacific Railway announced a cut to 43 cents per hundred pounds, from San Francisco to Salt Lake City. There is an agreement between the Union Pacific and the Central Pacific to carry freight from the Missouri River to San Francisco for 85 cents per hundred.

The Society of the Army of the Cumberland met at Cincinnati last week. General Sheridan was reëlected President, and the date of the next meeting was fixed for September 21 and 22, 1884, at Rochester, N. Y.

After a session of twenty-one days the General Convention of the Protestant Episcopal Church was brought to a close in Philadelphia on Friday.

Mr. Matthew Arnold made his first appearance as a lecturer in this country at Chickering Hall, in this city, on Tuesday evening. A very large audience greeted him. His subject was "Numbers." He failed to make a favorable impression because his delivery was not gauged to the hall, and many were unable to hear.

"Père Hyacinthe," the Rev. Charles Loyson, arrived in this city on Sunday. He has come to this country to lecture for the purpose of raising funds to carry on his work in France.

A reception was given Mr. Henry Irving, the English actor, at the Lotos Club in this city on Saturday evening. Speeches were made by Mr. Chauncey M. Depew, Gen. Horace K. Porter, Mr. Irving, and others. On the same evening Mr. Andrew Carnegie gave a reception at the Windsor Hotel in this city, to Mr. Matthew Arnold, which was attended by distinguished men in literary and public life.

Lord Coleridge was entertained by the Union League Club of this city on Thursday night. He paid a short visit to Yale College on Friday and addressed the students. He sailed for England on Saturday.

The sum of $250,225 has been subscribed by wealthy residents of Boston as a permanent fund for the Massachusetts Institute of Technology, to be called the "William Barton Rogers Fund." The income from the fund only is to be used for the support of the Institute.

The trustees of Asbury University, in Indiana, have completed an agreement with W. C. Depauw, that when the name of the institution is changed to Depauw University he will pay $2 to $1 of all subscriptions that may be paid by other parties, according to a schedule aggregating about $120,000. By this agreement, if it is carried out in full, the University will receive about $400,000, besides a provision in Mr. Depauw's will for a certain part of his estate at his death, a gift now estimated to be worth $1,000,000.

A report on the Mormon missions in the Sandwich Islands, published in Salt Lake City by the Church, shows a membership of 3,600. The King was present at the September Conference on the island. The Church owns a large sugar plantation there.

It is said that Claus Spreckles, proprietor of the California Sugar Refinery, who holds a monopoly of the Hawaiian sugar trade, has contracted for the purchase of the entire crop of sugar of the islands, on the condition that all shipments be made by his vessels. This is equivalent to a monopoly of the carrying trade both ways, as other vessels going there will not get return cargoes.

The Baltimore municipal election on Wednesday resulted in the election of Gen. F. C. Latrobe (Dem.), Mayor, over the Fusionist candidate, by a majority of 3,540. The usual Democratic majority is about 10,000, and the Fusionists are therefore much encouraged. There are some hopes of a Republican victory in the State election.

Governor Cleveland on Friday issued an order of removal upon Benjamin W. Downing, District Attorney of Queens County, for malfeasance in office in receiving two checks of $100 each to stimulate his zeal in the prosecution of a trial for manslaughter.

Dissensions have appeared among the Democrats of this city, and in many Aldermanic, Assembly, and Senatorial Districts two candidates are in the field. Tammany, Irving Hall, and the County Democracy are only united on the county ticket.

Mr. Worts, the bolting Republican candidate for the Senate in the Oswego District of this State, withdrew on Thursday in favor of Mr. Lansing.

The National Horse Show in this city was brought to a close on Friday evening after a very successful season of five days, during which the Madison Square Garden was crowded with visitors.

Eight white ruffians were on trial in Atlanta, Ga., last week for terrifying and abusing negroes during the campaign of last year. They belonged to an organization called the "Pop and Go Club." On Saturday they were convicted.

Dr. Leonard D. Gale, of Washington, for a long time well known in scientific circles, is dead. He was the assistant of Prof. S. F. B. Morse at the time when he was perfecting the magnetic telegraph, and gave him valuable aid in the invention.

Gustavus V. Fox, Assistant Secretary of the Navy during part of the war, died in Lowell, Mass., on Monday, at the age of sixty-two.

FOREIGN.

The general impression produced in Paris by the condition of the relations between France and China on the Tonquin question, as shown by the Yellow Book, recently issued, is that all negotiations between the two countries are exhausted, and that only war or mediation will settle the dispute. The Chinese Legation in Paris are dissatisfied with the many omissions of the book, and have published all the documents bearing upon the Tonquin question. They add little to the correspondence already published, except that arguments are offered in favor of China's position.

M. Challemel-Lacour, the French Minister of Foreign Affairs, in the Chamber of Deputies on Tuesday afternoon explained the Tonquin policy of the Government. He denied that the expedition was an adventure, and justified the attack on Hué and the forts. He added that negotiations with China had only been interrupted, and he believed that events would speak for themselves. The debate on the subject was adjourned.

Mail advices from Saigon seem to confirm previous reports of atrocities in Anam. One report says that Admiral Courbet directed, in an official order, that there should be no quarter given to men, women, or children. Three hundred Anamites who had taken refuge in the mouth of the Bay of Thuan, were shot. One hundred and fifty more, who were drifting in a junk, without arms or oars, were also massacred. The Paris *Figaro* declares that Admiral Courbet, at the instance of Commissioner Harmand, allowed the perpetration of such acts in order to terrorize the Anamites. The *Temps* denies that Admiral Courbet gave such orders, but admits that 1,200 of the enemy were slain at Thuan.

The Paris *Figaro* on Tuesday published a report that the Governor of the Chinese province of Yunnan, with 14,000 troops, had received orders to enter Tonquin and occupy Cao-bang, about 130 miles north of Hanoi, the French headquarters. The French Government, in view of the warlike attitude of China, will ask the Chamber for a much larger credit for the expenses of the expedition in Tonquin than was originally intended. It does not expect a defeat in the Chamber on its Tonquin policy.

At a meeting of the English Cabinet in London on Thursday, the affairs of Mr. Shaw, the English missionary, late of Madagascar, were discussed. It was asserted that France would grant an indemnity to Mr. Shaw of £1,000, besides officially expressing suitable regrets at the occurrence. This closes the incident.

The Conference for the Protection of Submarine Cables has been concluded in Paris. The most important feature in the Conference was the English proposal that in the event of war any Power be at liberty to withdraw, with the right of readmission when peace has been concluded, and the Conference adopted this principle. This means that in case of war any Power may cut cables at its own risk and peril. The cables must take the same chances as other property at sea. The Conference unanimously signed the draft of a convention for the protection of cables, and it is hoped that the convention will soon be sanctioned by treaties.

At the annual meeting of the five academies in Paris on Friday, Count de Lesseps delivered a long lecture on the scientific and civilizing character of great enterprises intended to facilitate intercourse between nations. He insisted that the maritime highways should no longer be subjected to the vicissitudes of the active politics of governments, but should be open at all times.

A recent despatch from Panama as to the progress of the work on the canal shows that the total length of the canal is seventy-four kilometres. It is divided for work into twelve sections, employing daily thirty steam excavators, forty locomotives, and 800 up-wagons. There are 90,000,000 cubic metres to be excavated. The force employed upon the work is upward of 10,000 men, and the excavation up to the 15th of October amounted to more than 2,500,000 cubic metres. The working force will soon be augmented to 15,000 men.

The Geodetic Conference in session at Rome has adopted a report favoring the universal adoption of the Greenwich meridian, and also recommending, as the point of departure of the universal hour and cosmopolitan dates, the mean noon of Greenwich.

It is asserted in London that when Parliament meets, Mr. Gladstone will propose that Sir Henry James, Attorney-General, be made Speaker of the House of Commons, in the place of Sir Henry Bouverie William Brand, the present Speaker, who is to resign. Another account says that it is authoritatively denied that any time is fixed for the Speaker's withdrawal.

Several Irish National League meetings which were announced for Sunday were proclaimed.

The Poor Law Guardians of the Limerick (Ireland) Union have resolved to take advantage of the Laborer's Act, and build a thousand cottages for the accommodation of laboring men.

A terrible explosion occurred on Tuesday evening near the Praed Street underground station on the Metropolitan Railway of London. Six cars were shattered, and more than forty persons injured, many of them seriously. Almost simultaneously there was an explosion on the underground railway between Charing Cross and Westminster stations. Car windows were smashed and the Charing Cross station injured. It is said that four machines similar to rockets were found in the tunnel near the Praed Street station. The explosions are believed to have been the work of Fenian dynamite conspirators.

Mr. John Bright denies that he has any intention of visiting America, as has been reported.

Sir Moses Montefiore, the Hebrew philanthropist, received congratulations from all parts of the world on Wednesday, when he entered upon the one hundredth year of his life

Miss Mary Anderson on Saturday night appeared in London as *Pauline* in the "Lady of Lyons," and met with an enthusiastic reception.

The cotton house of Morris Ranger, prominent in Liverpool, suspended on Tuesday. The failure caused great excitement in the cotton trade. The liabilities are estimated at $2,000,000, due to parties in Liverpool, and $200,000, due in Havre. Many other brokers were involved. The failure of R. H. Forman & Co. soon followed.

At a conference of the Fair Trade League now sitting in London, the imposition of a moderate import duty upon foreign wheat, in order to encourage the trade of the British colonies, was advocated.

The Irish informers, Michael Kavanagh, Joseph Smith, and Joseph Hanlon, have arrived at Calcutta, whither they were shipped as grooms on a steamer which took horses from Melbourne to the former port.

The latest Nihilist proclamation which has been circulated at St. Petersburg demands that the Czar summon the representatives of the Russian people, and asks for full amnesty, freedom of the press, freedom of speech, and the right to hold public meetings, as the only means of preventing a revolution. Pitiless vengeance is threatened if the demands of the Nihilists are disregarded.

The *Journal de St.-Pétersbourg* declares that the foreign policy of Russia is entirely devoted to peace, that her relations with all foreign Powers are excellent, and that there is no question now pending that is likely to disturb the quiet which all Governments are striving to maintain.

At the recent opening of the Austrian Delegation the President made an address, in which he pointed out that the necessity of peace was universally felt, and that the Government would take this into account, though asking the Delegation to furnish means for the protection of the monarchy under all circumstances. The members of the Delegation were received by the Emperor Francis Joseph on Thursday. In an address he said that Austria's efforts had ever been directed to peace; and that while the reforms that were to be instituted in the imperial army and the formation of the reserves would require additional expense, he hoped that the tranquillization of Bosnia and Herzegovina would lead to a reduction of the army of occupation in those provinces.

Prince Alexander, of Bulgaria, held a Cabinet council on Friday evening upon the question of the recall of the Prince's Russian aides-de-camp, Generals Soboleff and Kaulbars, to St. Petersburg. It was decided to dismiss the Russian Colonel Roediger, who is acting as Minister of War. The Council also decided to dismiss all Russian officers now serving in the Bulgarian army, and to recall all Bulgarians who are in the Russian service. Prince Alexander, in accordance with the action of the Council, on Saturday requested Colonel Roediger to resign the war portfolio. This request Colonel Roediger refused to comply with, whereupon Prince Alexander ordered him to leave Sofia immediately.

The Berlin *North German Gazette*, Prince Bismarck's organ, denies the existence of an aggressive alliance, and declares that the Powers have only united to secure the peace of Europe.

The German Bundesrath, acting under the Socialist Law, has decided to prolong until September 30, 1884, the minor state of siege of Berlin, Hamburg, Altona, and other districts.

The Spanish Cabinet has agreed upon a diplomatic note which will end the controversy arising from the unfavorable reception of King Alfonso in the streets of Paris.

The recent royal decree in Spain has produced a favorable impression. The provision that in future general officers of the army shall hold staff appointments for only three years forms the principal topic of discussion in political circles. It is reported that Señor Castelar and his Republican supporters, at a meeting held on Wednesday evening, resolved to maintain a friendly attitude toward the new Government if it fulfilled its promises, especially to restore universal suffrage.

The appointment of Señor Camacho, lately Spanish Minister of Finance, to the Governorship of the Bank of Spain, signifies the union of the two political groups in the new Ministry, and is intended to prepare the way for the formation of a great Liberal party.

It is rumored that King Luis of Portugal, being weary of the Liberal agitation in his kingdom, thinks of abdicating his throne.

A despatch from Tchesme asserts that unless immediate relief is forthcoming, hundreds of persons whose houses were wrecked by the recent earthquake will die from fever and exposure.

Another severe shock of earthquake occurred in Smyrna on Sunday. At Vurla 169 persons were injured.

One hundred and fifty Egyptian soldiers were recently surprised and massacred by the hill tribes in the Singat defile, between Suakin and Cassala, in Nubia.

Cholera has reappeared in Alexandria, and there is a panic among the people. The best authorities say that the epidemic will not last long.

The Canadian Government has agreed to guarantee a minimum dividend of 3 per cent. on the stock of the Canadian Pacific Railroad for ten years. The company has given the Government an equivalent for the guarantee.

Lord Lorne and Princess Louise sailed from Quebec for England on Saturday. The people of the city bade them an affectionate farewell.

An official telegram published in Lima, Peru, on Monday, from Mollendo, announced that Arequipa had surrendered without a battle. Montero has fled, and Iglesias has been proclaimed President.

VIRGINIA BONDS.

THE case of Antoni *v.* Greenhow (Federal Reporter, 91), decided by the Supreme Court of the United States last March, toward which the vexed holders of Virginia coupon bonds looked with such hope and the leaders of the repudiating party with such fear, can hardly be said to have justified the feelings of either party. It would seem from a careful consideration of this case, taken in connection with State of Louisiana *v.* Jumel, decided the same day, that it fell dead upon repudiators and bondholders alike, not so much from the inconclusiveness of the decision as from the inability of the general public, if not of the bar, to understand its scope.

The case decides that the tax-collectors of Virginia cannot be compelled by mandamus to receive in payment of taxes the coupons cut from the bonds issued by Virginia under the law of 1871. Mr. Justice Matthews, whose opinion bears most strongly against the power of the bondholders to assert their rights, says, concurring with all the other Judges: "I agree that the State of Virginia, by the act of 1871, entered into a valid contract with the holders of its bonds to receive their coupons in payment of taxes, and that any subsequent statute which denies this right is a breach of its contract and a violation of the Constitution of the United States. But," he continues, Associate Justices Bradley and Gray alone concurring, "for a breach of its contract by a State no remedy is provided by the Constitution of the United States against the State itself, and a suit to compel the officers of a State to do the acts which constitute a performance of its contract by the State, is a suit against the State itself."

What is the meaning of this apparent contradiction in Mr. Justice Matthews's decision that the contract is valid and yet is worthless? It means that the holders of Virginia coupon bonds cannot force the State into specific performance of its contract—cannot compel the State of Virginia to pay them nor its officers to give them receipts; that the State and its officers, so long as they remain quiescent, can rest secure in this quiescence, guaranteed them by the sovereign nature of the State, and may listen undisturbed to the denunciations of the bondholders, absolutely free from all form of suit. But the decision means no more. When the State changes its attitude of quiescence to one of aggression, and in its turn demands money, in payment of which the bondholders offer coupons bearing on their face "receivable at and after maturity for all taxes, debts, dues, and demands due the State," and the State points to the Riddleberger law and still demands money, the bondholders, under the first paragraph of this decision, can reply that these coupons are as good payment for taxes to-day as in 1871, and any subsequent statute to the contrary is void; that although the bondholders cannot compel the State to execute a valid contract, neither can the State enforce against them an invalid law, else the power of the State is absolutely without limit. Should the tax-collector, after tender of coupons, proceed to seize property, in spite of such tender, and sell it for taxes, the bondholders may sue him in trespass; and when he pleads the statute which directs him to disregard such tender, then, under Antoni *v.* Greenhow, such statute is void, and the Riddleberger law is no more effective in his defence than the authority of the Koran, the orders of Queen Victoria, or the suggestions of a daily newspaper. For further remedy, if the bondholders can prove that the sale of their property for taxes would work them injury irreparable in damages—as is easily susceptible of proof in cases such as the threatened sale of the rolling stock of a railway company—the tax-collector, acting under a void law, may be enjoined, just as any other unauthorized meddler may be enjoined; and if the amount of property involved be above the value of $500, the Circuit Court of the United States, under an impregnable decision of Judge Bond, in Circuit Court of the United States for the Eastern District of Virginia, September 4, 1883, has jurisdiction to enjoin him.

A legal training is not requisite to understand the distinction between compelling a State to execute its contract, and preventing a State from taking away those rights which have already been gained under a contract. In order to compel a State to execute its promise, its agents must be compelled to act as if under the authority of the State. Thus, for example, if the case of the State *v.* Jumel (2 Supreme Court Rep., 128) had been decided in favor of the creditors of Louisiana, the remedy, to be complete, as the Chief Justice points out, would have required the Court to assume all the executive authority of the State, so far as it related to the enforcement of this law, and to supervise the conduct of all persons charged with the levy, collection, and disbursement of the tax in question for the benefit of the State creditors. But the protection of individual rights already vested under a valid contract of the State involves neither suit against the State, nor startling practical results such as the possible assumption by the Supreme Court of the United States of the governmental machinery of a State; for the State is without power to authorize any individual to take away those rights. A law is passed directing a tax-collector to seize and sell after valid tender of payment; ipso facto, that law is void; it fades from the statute books instantaneously with the writing; its words are the unauthoritative virulence of inane demagogy, and he who acts under it acts at his peril. If suit against an agent acting under a law which infringes the Constitution of the United States be suit against the State, then the judgment in Osborn *v.* Bank of the United States (9 Wheat., 738), which ordered the treasurer of the State of Ohio to restore money held by him in virtue of a tax imposed by the State in violation of the Constitution of the United States, was an erroneous judgment, and the present Supreme Court will be obliged to overrule Chief-Justice Marshall, construe resistance into aggression, twist common sense into nonsense, subvert all protection of the individual against the illegal power of the State, and for no equitable end, but for the benefit of repudiation.

How far the majority of the present court are from straining after such construction and results is manifest in the recent case of United States *v.* Lee (1 Supreme Court Rep., 240), in which it was decided that the heirs of Robert E. Lee could eject the officers of the United States from the Arlington estate, although held only for national purposes, and although the officers expressly denied all claim by private title. True, four out of the nine judges, including the Chief Justice, held that, as the officers of the United States were in possession of the property only in their official capacity, suit against them was suit against the United States; but even under this dissentient opinion, if the United States had sold the Arlington property, held under a void title, to third parties, and the suit had been to eject the third parties, claiming under private right by purchase, the United States, in such case at least, would not be party to the suit. And who would buy property from a State or the United States when neither could give title? Thus, Virginia might seize mountains of goods and nobody except the owner would dare to repurchase them. A perusal of this learned dissenting opinion, moreover, which was delivered by Mr. Justice Gray, will clearly show that even the judges most broadly construing the immunity of a State from suit, hold that actions sounding in damages against the agents of the State, or injunctions to prevent causes of actions sounding in damages, are not suits against the State itself; but that a suit to be against the State itself must be such that the judgment therein requires the court to wrest property from the official possession of the agents of the State, or requires the court to compel the officers of the State to do official acts.

MR. MATTHEW ARNOLD'S VISIT.

MR. MATTHEW ARNOLD'S arrival has brought up the old discussion as to what kind of reception a foreign literary man or politician should receive who has at some time or other spoken disrespectfully of the American people, or failed to sympathize with the North during the late civil war. That Mr. Arnold has uttered unpleasant criticisms on the American people is quite true, but these criticisms followed inevitably from his setting Americans down as middle-class Englishmen, on whose faults he is never tired of dwelling. That Americans have a good many marks of middle-class Englishmen, there is no denying. They are chiefly what Englishmen call "Dissenters," as a term of reproach—that is, persons whose intellectual activity runs mainly in religious channels, and who belong to denominations maintained by voluntary contributions; who are greatly absorbed in money-making, and are disposed to take a contemptuous view of pursuits which are not "practical," that is, which do not result in material gain. Seeing these marks, it was not unnatural that he should infer the existence of the accompanying mental and moral defects which he thinks he has discovered among his own countrymen; or that, in other words, he should think of Ameri-

can Methodists, Baptists, Congregationalists, and Presbyterians—the bulk of the population, namely—as persons with a stunted sense of beauty, and very bad manners, and a narrowing religious belief. Nothing is commoner in England to-day among literary men and social philosophers than this plan of describing Americans by calling them middle-class Englishmen. It saves much trouble, and there exist a great many easily cited facts to support it.

Mr. Arnold's experience, however, was defective when he came to talk about America, as that of so many other European observers has been, in that he had never seen a middle class which had no class above it, or Dissenters who had no established church to dissent from. No one who has ever made a study of the English middle class has failed to remark that a great deal of whatever is defective in its tastes, or manners, or intellectual outlook, has been due to the position of inferiority in which the structure of English society, not to speak of English legislation, has kept it for more than 200 years. Probably nothing has a worse effect on the mind and manners of either men or women than the constant sense of the presence of social superiors. The damage this has inflicted on the English middle-class life is well known to all observers, and it has been aggravated by the fact that it has followed the English middle-class man to church, and made his very worship on Sunday a mark of his inferiority. What Mr. Arnold has not yet seen, but what he needs to see before he can safely generalize touching the effect of "Hebraism" and trade on mind and manners, and will here see, is a middle class which feels itself as good as any class; Methodists and Congregationalists who think their church a place to be as proud of as any cathedral; "Dissenting ministers" some of whom are a little disposed to think Anglican ministers their inferiors in culture; and traders who smile at the social pretensions of the idle rich, and are a little puzzled by talk of social distinctions based on occupations. All these he will find new phenomena, and phenomena which we are sure will lead him to revise, mentally at least, a good deal that he has written about his own countrymen as well as about Americans. There is nothing more interesting and often more startling than witnessing the effect of a new environment on a familiar object.

American audiences will find Mr. Arnold interesting also, because he is really the first genuine critic of note who has visited these shores, and there is nothing which the American public find it more difficult to comprehend than a critic. The art of criticism, as such, does not stand very high with us. Our conception of a critic is apt to be that of a man who, as Doctor Johnson said, "sees that the Whig dogs get the worst of it"—that is, who gives the enemy, whoever he may be, his due, and who, every time that he opens his mouth, strives to advance some "cause." The man who lets his mind play round phenomena, who sees them from all points of view, and notes what he sees with scientific indifference to consequences, or who, in other words, mainly cultivates open-mindedness, is a personage to whom Americans still find it very difficult to do justice, or give any definite place in the moral world. Mr. Arnold is not this kind of a person exactly—the type is rarely found in perfection out of France—for he has ideas for which he strives earnestly, and a cause (the cause of "culture") which he seeks in season and out of season to advance; but he is the nearest approach to it we have yet seen. It is perhaps more nearly true of him than of any other foreigner who has come here that he touches nothing which he does not adorn, and that whatever the degree of importance one may attach to his results, there is in the intellectual world to-day hardly any greater treat than watching his handling of any subject which really attracts him.

THE SITUATION IN FRANCE.

The French are apparently on the verge of another Ministerial crisis, the Budget Commission, or Finance Committee, of the Assembly, having unanimously condemned the budget of M. Tirard as showing or promising another large deficit, that is, about $12,000,000, while the cost of the Tonquin war is now assuming large and indefinite proportions. In truth, the original estimates, based on the supposition that it was to be a military promenade, have been known for some time to be ridiculously inadequate. The Chinese Government, which is much better informed about foreign politics than it used to be, has been very astutely protracting the negotiations, knowing well the effect prolonged uncertainty would have in depressing or alarming the French public and in embarrassing the Ministry. All hope of a peaceful settlement is rapidly disappearing, and every one in France is beginning to see that in the absence of a settlement with China the Tonquin affair becomes at once a burden on the army and treasury which the French public will probably not submit to.

Of course, in case of war with China the contest would not be carried on in Tonquin only, where the Chinese assistance to the Anamites would be very effective. It would probably include a second expedition against Pekin, and perhaps a blockade of the Treaty ports. But all this would cost money and men, and perhaps involve serious complications with England, for it would, temporarily at least, close the market for the Indian opium, which now yields a sixth of the Indian revenues, or about $52,000,000, and the Indian budget is too near simple equilibrium to bear any such disturbance as even a brief suspension of the opium trade would cause. There has been a curious dispute between the French and some foreign journalists as to whether the French could blockade one port without blockading all—that is to say, confine themselves, for instance, to shutting up Canton, which is easiest to get at, and let the others alone; but the weight of authority seems to favor the view that they can single out any port they please. At all events, they are satisfied that they have complete liberty of choice in the matter. They will undoubtedly get the better of the Chinese, if worst comes to worst, in the long run, but probably not without producing an amount of confusion at home which may endanger the very existence of the Republic. There has been no Government since the downfall of the old monarchy which could stand an unsuccessful war. It would appear now as if, with the present constitution of the army and with the present great financial burdens, no Government in France could stand a long war, and especially a long foreign war. France is the only highly-civilized country to-day which attempts to send conscripted troops to fight distant battles in unhealthy climates, and it is pretty plain that it is an immense mistake — that the people will not submit to it.

At the bottom of all this confusion and calamity is the notion that the prestige which France has lost in Europe can be recovered by setting up colonies on distant shores. There is literally nothing in French experience to support this notion, except the settlement of Canada. Canada was settled, however, under an order of ideas which has lost all hold on the French mind, and before the peasantry had got its present grasp of the soil, and before the increase of comfort and the establishment of equality had made the French the most stay-at-home people in the world. The care they take to restrict the size of their families—which makes economists and military men so angry—is in reality a sign that they do not wish to go abroad and make colonies. In fact, the material for colonization is not to be found in France, and the result is that her colonies even in Algeria are purely official affairs, which are only kept alive by Government aid and regulation. They bear little more resemblance to German, American, and English settlements on new soil than operatic villages. Seeking with fire and sword new territory to plant them in, while the population is declining in such a way as to draw large bodies of immigrants from Italy, Belgium, and Switzerland, and even Germany, seems one of those immense blunders which give much support to the belief which the Germans are preaching with no little energy and plausibility, that France has irretrievably lost her place in the front rank, and is hereafter to share in the rapid political decadence which has overtaken all branches of the Celtic race.

THE REVIVAL OF GERMAN INDUSTRY.

It may be remembered that the account given of the German products, if we are not mistaken, by the German Commissioners in their report on the Philadelphia Exposition of 1876, was anything but cheerful, especially as regarded those of an artistic character. The conclusion which a great many people reached at the time was, that this was one of the results of the war with France, and that as long as Germany was suffering from the military fever which the war generated we need not look for any industrial revival. Bismarck's protectionist policy has to a certain extent had the effect of confirming and extending this belief.

Recently, however, an inquiry has been set on foot by the Saxon Government with the

view of ascertaining whether the artistic industries, properly so called—that is, those in which design plays a prominent part—are in need of further protection in order to encourage and revive them. For this purpose it consulted the Chambers of Commerce all over the country. That of Leipzig took a good deal of evidence on the subject, and made a very elaborate report. Some of the evidence was very interesting and instructive. One dealer said that his importations of objects of art were not one-twentieth of what they were ten years ago; that the German manufacturers now supplied nearly everything that was called for, and, more than this, that they worked almost exclusively on German designs. Moreover, they were constantly receiving large orders, especially for artistic metal work, from both France and England, and really needed no protection at all. The only formidable competition they encounter is in the finer bronzes, in which the French still maintain their old superiority, but these are very dear and the German market for them is limited. In fact, the manufacturers in this field say that they could not live on the home market: their best customers are abroad. They maintain, too, that they now compete successfully with the French in that great French specialty, mantel clocks. Of these they exported last year over 3,500 tons, some of them to France itself, and imported only thirty tons. The manufacturers of fine pottery, of glass and leather goods in like manner refuse all protection. They say they are not afraid either of France, England, or Austria, and assert that they have beaten the Bohemian glass-workers. The woollen, silk, carpet manufacturers, and those of upholstery stuffs talk in the same way, and one of them calls attention expressly to the fact that the revival in their business began long before the protectionist tariff of 1879. One manufacturer, only, asks for increased duties, on the ground that he has started a mechanical lace industry, and needs encouragement till his workmen are better trained; but the Chamber of Commerce does not think he has made out his case.

Side by side with all this progress in extending their markets, the Germans are giving a good deal of attention to the condition of the small trades which are carried on in shops and dwelling houses, or, in other words, to the work of the solitary artisan—the shoemaker, the tailor, the locksmith, and the like—working in villages or small towns. At a Conference recently held in Dresden it was proposed to establish some kind of organization for supplying this class with information regarding improvements in tools or machinery, or processes in their several trades, and inventions or scientific discoveries likely to benefit or interest them, and more particularly any new modes of supplying motive power on a small scale for machinery, and for the diffusion among them of good artistic designs. The Conference suggested for this purpose the establishment of committees of the various trades, charged with the duty of supplying information and the holding of expositions, permanent or periodical, of the newest tools, machines, and so on; or, in other words, of putting within reach of the small manufacturers that knowledge of what is going on in their own business in other parts of the world, which is now only possessed by the great ones.

All this is the more creditable—or perhaps we should say the more necessary—because of the very serious obstacle to industrial progress created by the German military system. This does not consist simply in the drafts made by the army on the physical force of the country, and on its spare funds, but in the drafts it makes, as we said a few weeks ago, on its mental force. All the political and social arrangements of the German nation tend almost irresistibly to throw the ablest and most ambitious men into the army, and to cause the application of a prodigious amount of the national talent, even in times of profound peace, to simple preparation for war, or, in other words, to the study of the best modes of killing people and destroying property. Everything that can be done is done to exalt the soldier, and make the youth of the country think his trade the most honorable of all. He is not highly paid, it is true, but he does not as yet need to be, because money has not as yet become a power in German society; in fact, it is still "the thing" in Germany for an aristocrat to be poor. That German industry flourishes at all under these circumstances, and that the country is able year after year to send a great deal of excellent skilled labor to nearly all parts of the world, are very remarkable illustrations of the national power. In France and in this country there is hardly any branch of industry in which German emigrants do not compete successfully with the natives on their own soil. We, who live in an industrial and commercial atmosphere, in which all the rewards that society has to offer are held out to the successful mechanic, and manufacturer, and trader, can hardly appreciate the difficulties over which German industrial energy triumphs.

PERSISTENCE OF SPANISH TYPES IN MEXICO.

Motley, in the thirty-fifth chapter of his 'United Netherlands,' paints in a few striking pages the portrait of the Spaniard of the sixteenth century. Egregious self-esteem, contempt of labor, superstition, intellect acute but narrow, indomitable force of will, imbecility in government—trait after trait is thrown upon the historian's canvas. It is singular that so few of the modern writers on Mexico have remarked the surprising distinctness with which the picture of Spain in the sixteenth century is reproduced in her lost Mexican provinces. Until within twenty years Mexico was more Spanish, in the sixteenth-century sense, than Spain herself. The impress made by pioneers of such iron mould as Cortes, Alvarado, Las Casas, Revillagigedo, was deep. A plastic people were stamped by it. Isolation kept away opposing influences. The type was petrified. Spain herself did not so easily escape, for she was too near the crater of 1789 in France, and, afterward, had to take the rude buffeting of the Napoleonic wars. While she was being awaked by the buzz of the modern world of science and industry and commerce, Mexico was left to placid slumber. In the latter country it was still possible for the ideas of a Philip, a Parma, a Lerma, to live. It is the more to be regretted that some serious attempt has not been made to trace the persistence of Spanish types in Mexico, because the opportunities for observation are rapidly disappearing. Mexico has undergone greater changes in the past twenty years than she did in the three hundred before. At present she is the subject of many contending influences—German, French, above all American—each stronger than the Spanish. What the resultant will be is not clear, but it is certain that a new type of some kind will replace the old.

Mexican architecture is Spanish sixteenth-century architecture over again. No town is complete without its plaza; if it can have its *alameda* too, so much the better, but better not to be than to have no plaza. Much the same is true of the matter of public *portales*. Little mud-built hamlets on the flank of a mountain will have their one or two arches, under which the natives lounge with a self-satisfaction fully as ineffable as that of the saunterer in the Plaza Mayor of Madrid. The low houses, with interior courts giving glimpses of flowers and fountains, make one expect to see Moorish faces at the balcony window, not the Indian features which really do appear. But particularly in church architecture are we carried back to the beginning of the Renaissance in Spain. Spanish architecture, then a conglomerate of Gothic, French, and Moorish, was appropriating Italian features. Over all it spread a most elaborate and detailed ornamentation, occasionally rich in its effects, more often tawdry. It put its vast treasures from the mines of Peru and Mexico into this extravagance of ornament, just as the Spanish peasant turns all his resources into brilliantly-colored serapes and silver spurs. All this is reproduced to the life in Mexico. There are the same cruciform churches, with dome-shaped lanterns at the intersection of nave and transept, and Moorish towers flanking the entrance, all covered with a profusion of senseless and bewildering ornament. There is the old Moorish skill in working in plaster, the old Spanish passion for rococo. You might stand before the *sagrario* of the Cathedral of Mexico and imagine that you were in Zaragoza.

Mexican education is still trammelled by Spanish methods. The memory is wonderfully stimulated and trained, the reasoning powers are left dormant. Children are made parrots. Writing is the reproduction of admired models. Everything goes by authority. The universal manual of grammar, for the youngest children, is a compend of the Academy's grammar, which endeavors to pour Spanish into the grammatical moulds of Latin. Childish tongues glibly talk of dative and ablative, of which their language is as innocent as is English. Yet public education is regarded as of the utmost moment in shaping ideas of liberty and patriotism, and is jealously watched. The Professor of Logic in the National Preparatoria, in Mexico city, recently wished to introduce Mill and Spencer as text-books. The entire press lifted up a cry of horror. The Church organ, *La Voz de Méjico*, was fairly outdone by the indifferentist *Monitor Republicano*. The foundations of morals were to be undermined. All the high sentiments of patriotism, which then inspired the generous breasts of Mexican youth, were to be destroyed by this dreaded experience-philosophy. The professor was obliged to yield to the clamor, at the risk of losing his chair.

But the lesson taught her by Spain which is, perhaps, the hardest of all for Mexico to unlearn, is the lesson in the art of government, in Spanish political economy. Without undertaking to point out the various fictions which the Mexicans cherish in regard to their public affairs—the fiction of national grandeur, of republican institutions, of reverence for the Constitution—it is enough to remark that the general policy of the Government has seemed to aim at throttling domestic industries and commerce and at pro-

hibiting foreign trade, with a fatuous complacency truly Spanish. From the lowest to the highest form of governmental organization, the idea seems to prevail that the Government is intended to act the part of an Arab sheikh, and extort every penny possible from any who are so bold as to think to profit by trade. The municipality comes first, laying especial taxes, in the shape of licenses, upon every sort of store and shop and factory, and allowing no single pound of meat or bushel of potatoes or quart of milk to enter its gates from the surrounding farms without paying for the privilege. Next gleans the State Government, claiming customs duties on all inter-State commerce, even on that which simply passes through her territory with destination to some point beyond. Finally the general Government appears upon the scene. It starts off with an internal-revenue system which would command the admiration of a Turkish governor. There is scarcely an act one can perform without the need of a revenue stamp. All receipts, bills, contracts, have to bear the stamp to be legal. If you wish to keep accounts, you must take all your books to the Government inspector, and get his legalizing stamp upon each page, for which you have to pay according to their size and number. At one time the law compelled all merchants to affix a stamp to every dollar's worth of goods sold; but this law was repealed, partly because it was odious, more because it was difficult to enforce. In matters of foreign trade the country is equally benighted. Money is regarded as the sole form of wealth. There was an export duty on silver coin until two years ago, when the dizzy rates of foreign exchange drove Congress to allow the free export of money. And still the people greet the bullion carts on the way to the dock with groans and imprecations, as they see the country being impoverished.

The outrageous tariff has not even the excuse of attempting to protect home industry. There is practically none to protect. The worst of it is that importers cannot depend upon a collection of duties in accordance with the tariff. Exorbitant fines, or bribes, have always to be counted on. A person going to Mexico to live, and wishing to take a few household goods, was told of the intricate ways of interpreting the tariff. He went to the office of the Mexican Consul in New York and had his invoices made out in accordance with the strict letter of the law, as he was assured. For this service he paid $4. In Vera Cruz he was fined $34 for imperfect invoices. It is useless to protest. An appeal to the courts is a costly affair, and promises little satisfaction. If importers should combine in getting a decision on a test case, the result would be vain, as there is a special law forbidding the establishment of precedents in the interpretation of tariff laws.

One sees, in the light of such facts, what a great step it was for the Mexican Government to take, to agree to the proposed treaty of reciprocity with the United States. No doubt those are right who attribute this to the all-powerful influence of ex-President Diaz. It is fortunate for Mexico that he, practical dictator that he is, is a man of such enlightened and liberal views. He secured the charters and subsidies for the American railroads, and did it in the face of the intensest opposition. The proposed treaty was furiously attacked. The press was almost a unit against it. Foreign influence was strenuous in opposition to it. But a voice from Oajaca was heard, and the Congress which it controls agreed to the treaty. If our Senate does not concur in it, a similar opportunity may not present itself for a generation.

HENRY IRVING IN "THE BELLS."

THE audience which assembled in the Star Theatre on Monday evening was perhaps the most numerous and distinguished ever seen within its walls, and the occasion will be long remembered even by those to whom theatrical scenes are most familiar. There is not an actor to-day who has been the subject of more critical discussion than Henry Irving; not one about whose abilities so many contradictory opinions have been expressed; not one who has been more extravagantly praised or more vigorously denounced. By his admirers he has been upheld for public adoration as a genius of the rarest brilliancy; by his detractors he has been derided as a mischievous charlatan; and amid the clatter raised by friends and foes nothing seemed certain except the fact that he had attracted more attention than any other man upon the English stage. This in itself was sufficient to stimulate curiosity concerning him to a high pitch, to say nothing of the general knowledge that his managerial career had been a succession of triumphs, and it was a foregone conclusion that his first professional appearance in New York would be one of the most notable dramatic events of this generation. This ordeal—one of the severest which any player can be called upon to face—is over, and nothing remains but to consider the result as carefully as is possible under the circumstances.

It is easy enough now to understand much that seemed inexplicable in the irreconcilable verdicts recorded by competent critics respecting Mr. Irving's achievements. His performance in "The Bells," the play selected for Monday's representation, establishes certain facts beyond dispute, but furnishes a comparatively slender foundation upon which to construct a comprehensive estimate of his powers. Until an actor has been seen in several characters no one can judge absolutely his capacity for impersonation, because it is impossible to determine whether certain tricks of manner or gesture are personal characteristics, stage mannerisms, or deliberate device; but it is safe to say of Mr. Irving that he is an actor with tremendous faults and most potent charm. His *Mathias* is a work as full of contradictions as any of the criticisms which it has evoked. It is stilted to the verge of the ridiculous, yet at times vividly natural; it is painfully labored and mechanical, yet illumined by many flashes of genuine emotion; it is marred by all sorts of affectations, and yet impresses the spectator with the sense of a sustained identity. Some of the lines are delivered so badly as to be almost unintelligible, others are read with a simplicity and force wholly admirable. All this shows how easy it is for the hostile critic to find fault and the friendly one to wax eloquent in praise; and it may be added that the individuality of Mr. Irving is so strong and his style so pronounced, that it is difficult to avoid strong prejudice either for or against him.

Whatever the final verdict may be, there can be no doubt of the effect which he created among the audience, which was first amused, then puzzled, then interested, and finally enthusiastic. Its friendly disposition was declared in the prolonged outburst of applause upon the actor's first entrance; its interest, in the dead silence which prevailed through the third act; and its enthusiasm, in the unmistakable heartiness of the plaudits at the fall of the curtain. It is a curious fact that there was scarcely any applause during the actual performance. When the echoes of the first boisterous welcome had died away, the house settled into an attitude of anxious expectation. This sensation was followed by one of blank amazement. The entrance of *Mathias* was exceedingly effective. The quick rush past the window, the abrupt opening and closing of the door, and the spirited action of the actor as he brushed the snow-flakes from his hat and heavy cloak and dashed the long gray hair upward from his brow were very striking and natural, but the illusion was not maintained. In the next few minutes it was easy to believe the worst that had been said of Irving's artificiality and mannerisms. His dislocated utterance, his palsied gait, the ungraceful jerking of his arms and shoulders, the incessant rise and fall of his eyebrows with every syllable that fell from his lips, the studied attitudes, the spasmodic gestures, might readily have been accepted as a burlesque of the ponderous methods of old English tragedy, and would have been laughed at had it not been for some subtle and indefinable suggestion of intelligent purpose and strong will. The methods were abominable, but the personal force of the actor asserted itself in spite of them. There was not a look or a gesture which was not the result of forethought or had not its special significance, but the intellectual perception which prompted it was made worthless by the wilful exaggeration in the execution of the design. That the exaggeration was wilful, or, at least, not chronic, was proved by the extraordinary truthfulness of Mr. Irving's acting when his daughter caressed him with the ejaculation, "How good you are!" The facial expression at this point was the first taste which the actor gave of his best quality. It would be difficult to imagine a more vital or piteous portrayal of anguish and remorse, and the effect was wrought in the most simple and legitimate manner. After this he relapsed into his purely artificial manner, and did nothing especially worthy of note until the apparition of the murdered Jew in his sleigh, when he stirred the house into sudden enthusiasm by a wonderfully executed fall and a smothered shriek of horror, which rang with the true note of despair. This effort was rewarded, and justly, by a double recall.

In the second act Mr. Irving's acting, although constantly marred by faults of manner previously alluded to, was brilliantly effective. His haggard face, his physical exhaustion, his petulance with his wife and the physician, his restless hands and eyes, furnished a striking picture of feverish dread nearly allied to madness. There were some magnificent touches, too, in his soliloquy over the gold which he counted for the dowry. The miserly ringing of the suspected piece, the running of his fingers through the heaps of coin, his self-congratulation over the betrothal with *Christian*, his horror at the discovery of one of the original coins stolen from his victim, were strokes full of imagination and power, and largely atoned for all his striding, mouthing, and posturing. Extremely fine, too, was the cunning of his scene with *Christian*, the forced and hollow laugh with which he sought to divert suspicion from himself, and the whole process by which he indicated racking suspense beneath an assumption of outward calm. His anxiety during the signing of the betrothal contract was somewhat overwrought—such conduct would infallibly have betrayed him—but the outbreak of almost maniacal glee with which he strove to drown the clanging of the fatal sleigh-bells was wonderfully done, and brought the act to a triumphant conclusion. This was completely spontaneous, and could be imagined only by an actor possessed of the finest dramatic instinct.

Another fine stroke is the solitary dance in the bedroom scene, where a very strong effect is secured by the contrast between simulated glee and the bitterest anguish; but the actor's chief success is won in the trial scene of the dream. Desperation, remorse, bravado, and cunning are

here portrayed with startling truthfulness, and with a sustained vigor which is very remarkable. The struggle against the influence of the mesmerist is splendidly acted, and the confession of the murder is recited with an elocutionary simplicity and skill which prove conclusively that the blurred delivery in some of the previous scenes is a mere trick. The pantomime of the murder is exaggerated but very effective, and the final death scene, with its horrible suggestion of strangulation on the gallows, is as realistic as the most morbid imagination could desire. The applause which followed this achievement was so great that Mr. Irving, after being called twice before the curtain, was compelled to deliver a brief speech, in which he returned thanks very gracefully for the cordiality of his reception, and begged for a similar welcome for Miss Terry.

Our review is necessarily imperfect. Comparison in Irving's case is impossible, not because he is the greatest or worst actor who ever lived, but because he has chosen to adopt a style which is a compound of old and new, and bristles with anomalies and anachronisms. He himself has in his time played every type of character, from *Jeremy Diddler* to *Hamlet*, and this varied experience is shown in his work. A man of indisputable originality, he elects at times to be a copyist, and copies badly; but if he copies from conviction, he is at least independent enough to act according to instinct when he chooses, and his instinct is generally right. The probability is that if he would cut loose from tradition altogether in fact, as it is said that he professes to do in theory, there would be fewer differences of opinion about him. It is certain that his worst faults in *Mathias*, which is a melodramatic and not a tragic character, are due to a foolish adhesion to the rules of a dead school of which Samuel Phelps, said to be his model, was the latest expositor of note. But Phelps never carried the traditional strut and stride of the Kemble and Siddons school to such extremes, and pupils ought to be no less moderate than their masters in these matters. Mr. Irving has many advantages. He has a face of great mobility and expressiveness; he has the length of limb which lends force to gesture; he has a voice of good natural quality, if of little force; he has great self-reliance, long and varied experience, keen intelligence, and a large amount of that mysterious influence commonly called magnetism. All this is apparent from his present performance; whether or not he has genius, it is too early to say. That question can be decided when he has given some specimens of his versatility. The one general reflection which can be made safely after seeing his *Mathias* is that he is far stronger in repose than in action. His powers of facial expression are remarkable—equal probably, if not superior, to those of any actor upon the English-speaking stage; and his features lend themselves apparently most readily to the interpretation of the more violent emotions—a valuable gift to a tragedian. His professional training, as has been said, is wide and thorough, and he is in every respect well equipped in the mechanical resources of his art. The intelligence evident in his work makes him a most interesting actor. Whether he is great will be known when he has appeared in other parts.

FERRY *VERSUS* THIBAUDIN.

PARIS, October 12, 1883.

OUR Cabinets are very short-lived, and it is doubtful if, in the long run, the system of ministerial responsibility can be found applicable under a republican form of government. The Ferry Cabinet came into power under circumstances which are not yet forgotten. Prince Napoleon threw into the dead calm of Paris a manifesto—"La France languit," etc.—which produced the most violent agitation in the Chambers, and in the first moment of fear and of consternation it was proposed to exile the members of the families which had once reigned in France. This law, occasioned by a Bonaparte and directed against the Orléans, was passed by the Chamber of Deputies. Its injustice was obvious, as the Orléans princes, so far from making any opposition to the Republic since it had been established, had accepted office under it. Three of the princes were serving in various capacities in the ranks of the army. None of them had given any encouragement to the Opposition press; they led quiet lives, like private citizens, and seemed to be quite satisfied with a position which, at any rate, was the end of their long exile. The Senate did not follow the Deputies in their ill-timed attack on the "pretenders"; the bill of banishment was thrown out. At the same time, as often happens in France, it was found that some measure of compromise must be sought, and some satisfaction given to the Deputies. If the princes could not be sent into exile, could they not be put out of the army? There is in every army a great power vested in the Commander-in-Chief; could not that power be used against the Duc d'Aumale, the Duc de Chartres, and the Duc d'Alençon? The question was put to many generals in the army, and they all refused to execute the princes by decrees. The only cases in which the Minister of War can dismiss an officer are those in which the honor of the profession has been touched, and, even then, six months after the ministerial decree has dismissed him, the officer has a right to call for a court martial. Professionally, no reproach could be brought against the three princes; they had been, in fact, models for the army—one in the capacity of Commander of the Seventh Corps at Besançon, the Duc de Chartres as Colonel of a regiment of cavalry, the Duc d'Alençon as Captain of Artillery.

When Jules Ferry composed his Cabinet, he had the greatest difficulty in finding a general for the delicate task of dismissing from the army three officers for the mere reason that they belonged to a royal family. Ferry had already broken up the Congregations by decrees, without having a new law on his side, and simply by appealing to the old monarchical laws. He was obliged by the will of the Chamber to force the princes out of the army, and in this case he could not even appeal to old laws: he could only use the dictatorial power of the Minister of War. A man was found willing to do the work, General Thibaudin. He had been somewhat under a cloud since the war of 1870: it is sufficient to say that General Thibaudin, having fled from Germany, reëntered the army in France, and thought himself obliged to change his name to Comagny. In the general report on the war published by the German Staff, he appears always as Comagny (Thibaudin). The German Government, however, made no observations on the nomination of General Thibaudin as Minister of War in the Ferry Cabinet. The work of expulsion was done immediately—as soon as he took office, General Thibaudin issued the decrees which he had promised to sign. It was thought at the time that, this being done, he would immediately leave the Cabinet. It was not so. General Thibaudin had now a strong claim on the Chamber of Deputies, and he had also endeared himself to President Grévy, and even more to his son in law, Daniel Wilson, who has become at the Élysée a sort of "Maire du Palais," and is said to have become the most ardent adversary of the Orléans, after having entered political life, during the Empire, under the auspices of the Orleanists.

Jules Ferry seems to be condemned by an evil fate to arbitrary measures. After having broken up the religious congregations and schools, not only without any special law, but against the wishes of the Senate (the Senate threw out, by a majority of seven, the bill presented against the teaching-congregations); after having employed General Thibaudin against the Orléans princes, he proposed a measure against the magistracy. This time he carried it not only in the Chamber of Deputies, but in the Senate. The courts were reorganized, and the number of the magistrates was slightly modified; but the great feature of the law was the establishment of a sort of six months' interregnum, during which the irremovability of the magistrates would be suspended. Six hundred judges will, during these six months, be removed from the bench of the high and of the lower courts; six hundred men will be sacrificed for no other than political reasons. Such hecatombs could only be possible in a country where justice is administered by so many magistrates; but whatever be the defects of our judicial administration, everybody must acknowledge that hitherto, and under so many governments, justice has always been administered in France with the greatest impartiality: our humblest magistrates are above suspicion. The purity of the bench is not owing to high salaries (the salaries are ridiculously small), but to a certain social status, to tradition, and to the principle of irremovability.

At the end of the session the Premier thought himself very strong; he had not had an adverse vote in either of the Chambers. His only difficulties seemed to be outside of France—in Tonquin and in China; and these difficulties he affected to disdain—when the journey of the King of Spain to Paris suddenly revealed the disordered state of his administration. The incidents of this journey might have been anticipated by a vigilant police. Paris has become, since the restoration of King Alfonso, the headquarters of the Spanish Republicans. Their chief, Zorilla, has only very recently left the French capital. His hand has been clearly traced in the pronunciamientos made a few weeks ago at Badajoz and some other places. Zorilla took advantage of the state of the Spanish army. A number of officers who owed their rank to a succession of pronunciamientos had been dismissed from the army, and had formed secret societies, which were open to many non-commissioned officers. The pronunciamiento of Badajoz was in reality the work of the non-commissioned officers. Without entering more into this subject, it is enough to say that the revolutionary party in Spain is not idle, and that its centre of action is in Paris. A few Spanish refugees could not, however, have made a demonstration in the French capital if they had not been able to work on the feelings of the French masses. An occasion was found in the nomination of King Alfonso as colonel of a regiment of Uhlans garrisoned at Strassburg. The French Radicals went immediately to work. Their leaders knew perfectly that this nomination had in itself no political significance, and that it was not meant as an insult to the French people; but they had not for a long time had any opportunity of measuring their strength, and they covered their innate love of disorder with the veil of patriotism.

While he was staying at Brussels, King Alfonso became aware that a demonstration was preparing against him in Paris. I myself, the day before his arrival, walked along the boulevards, and every few steps I was stopped by a man or a boy shouting: "L'entrée à Paris du Roi Uhlan! dix centimes." The *Intransigeant*,

the paper edited by Rochefort, was full of invectives against the young King, whom it called a "polisson." The King had announced his visit, and M. Grévy had come back from Mont-sous-Vaudrey in order to receive him. On his arrival at Paris, when the King entered his carriage he was insulted by hisses, which followed him all along the Rue Lafayette. It was noticed that the police took no pains to clear the streets completely when the King was to make his entrance; but this was not all. M. Grévy did not face the men whom he afterward called the "misérables"; he received the King at the station, and then went home independently, leaving his guest face to face with the "misérables." All the ministers had gone to the Northern Station with the exception of the Minister of War. General Thibaudin sent word that he had an attack of gout. Nobody believed in this unexpected illness, and the Radical papers represented General Thibaudin as the only patriot in the Cabinet. Not only was the Minister of War absent, but, under his inspiration probably, the commander of the military forces in Paris sent a very insufficient escort to line the Northern Station, and to accompany the King to the Spanish Embassy.

The disgraceful scenes which took place on the arrival of the King of Spain, and afterward on his visit to the Élysée, have an importance which can hardly be overrated. All the sovereigns of Europe will feel that Paris is not safe ground for them, and that the Government of M. Grévy either cannot or will not protect them against insults of the mob. Jules Ferry has perceived the danger of an interdict being put by all the Powers of Europe on the French capital, and, though General Thibaudin is a *persona grata* at the Élysée—though he is politically the ally of M. Daniel Wilson—the Premier has insisted upon his leaving the Cabinet. The battle is now fairly begun: the Chamber, when it meets, will have to choose between Ferry and Thibaudin, which means almost between Ferry and the Élysée. It is obvious that things have come to such a pass that, notwithstanding all he has done before, Ferry represents now the most conservative—or, if you like, the least revolutionary—policy; he has placed himself on the side of the law of nations, the respect due to the representatives of other nations, the common decencies of international life. On the other side we see nothing except the feverish and blind folly of the men who screamed "Berlin!" in 1870, and never fought the enemy but made the Commune; the false patriotism of words; the destructive wit of a Rochefort, who, the day after the entrance of King Alfonso, wrote an article entitled "Es-tu content, mon Colonel?" The Chamber has shown such petty passions, such an ignorance of the state of Europe, it is inspired by such small motives, that I confess the impossibility of prophesying its verdict in the case "Ferry *versus* Thibaudin."

Correspondence.

WHAT CONGRESS SHOULD DO NEXT FOR THE NAVY.

To the Editor of The Nation:

Sir: It is stated that the Democratic candidate for Governor of Ohio, in a speech arraigning the party in power, among other things stated that by maladministration the navy had been reduced to a state of inefficiency and weakness unworthy of the nation. If the party in opposition should take this as one of the issues of a campaign, it is difficult to say what the answer could be, for the administration of the Navy Department from the time of the closing of the war until the beginning of the Administration of Garfield has resulted in bringing the navy into such a state that there is no first, second, or third-rate Power, not even any semi-civilized maritime Power, but has a navy of more efficiency than that of the United States.

With a yearly expenditure of money sufficient to give us a respectable number of armored and unarmored vessels of modern types, we find that instead the appropriations have been frittered away, under the bureau system, on naval stations, in keeping up elaborately expensive establishments, in making repairs to and rebuilding obsolete vessels at highest prices for labor and material, and in many ways squandering money and doing little that was real or effective to prevent the decline and decay of the naval resources of the country aloft. Truly, it is not one of the things that the party in power can point to with justifiable pride.

The policy of the United States has been almost invariably peaceful, and seldom aggressive, yet no one can accuse us of being a cowardly people. Too much blood and treasure has been shed in the past to allow even our enemies so to speak of us. A nation of fifty millions of people occupies too large a space in the world, and contains too many elements, to pursue always a policy of isolation. There are many complications with foreign nations that the future can bring, and we may be called upon at times to resist and refuse aggressive demands which would lead to war. The well-known defenceless state of our coasts would cause offensive action which, under other circumstances, would not be thought of, and in the event of war would lead quickly to an attack upon our rich maritime cities. These would present themselves as tempting prizes to even moderately powerful naval nations, and before we could realize that war was upon us we might find an enemy's fleet levying tribute from our largest ports. One cannot say what complications might arise with England from the Irish-American question alone; and the Panama Canal, when completed, will bring a host of questions with France or England, or both. Germany is not over-friendly, and the possibility of delicate relations with Spain from her West India possessions should be too well known to call for more than a passing mention.

Hence, waiving for the present the possibility of aggressive action on our part, under any circumstances, we must face the question and necessity of having a defensive policy, as an instinct of national self-preservation, or at least to prevent great national disgrace and disaster. To defend our coasts and harbors, we must have defensive naval resources. Few nations have so much seacoast to defend, and still fewer have the financial power in a greater degree to provide those naval resources. In case of a war, it would be only a question of a few *weeks* before most of the European maritime nations could have at least one powerful squadron of heavily armed and armored vessels before one of our principal ports. These nations have the vessels *now*, and would not have to wait years or months to construct or equip them. Besides, England, with her naval ports of Halifax, Bermudas, and Port Royal (Jamaica), would have the rendezvous for transports as well as men-of-war, and, instead of a long inland campaign from the Canadian frontier, she could very shortly supplement a naval attack by landing troops on our unprotected coasts. The defence of Washington, for instance, from a foreign force would have to be a naval one, commencing at the Capes of the Chesapeake; and the defence of New York must commence before the enemy's fleet anchor off Sandy Hook or Throg's Neck. The sentiment of the day seems to be to rely on an improvised navy and improvised defences. If we were fighting the air, or a nation without a modern navy, this might be thought of; but sensible men must see that this idea now is as antiquated as the spread-eagleism of thirty years ago. Naval vessels of the present day, the ordnance of the last ten years, or even the active torpedoes required for real defence, cannot be improvised, cannot be built, in time to meet the emergency. Even the few unarmored vessels ordered by the last Congress to be built will not be finished in a year's time, and already it is stated that the armament of these vessels will not be finished until some time after the vessels are finished—so feeble are our resources.

Many have consoled themselves with the idea that torpedoes duly planted at the entrance of our harbors would protect them; but they do not seem to realize that these torpedoes can be destroyed by counter-mines, and that a channel can be made through them under the guns of armored vessels. We have no fortifications to support these lines of torpedoes, and nothing existing that will prevent the approach of a squadron within shelling distance of New York and other smaller cities. We have no modern fortifications, shielded by chilled armor and heavy turrets, and we have no guns to arm them with; and there seems to be no definite intention on the part of Congress to build them. These alone would take years to build, and then would form a secondary system of defence, the primary and exterior lines being purely naval. This exterior line of defence must consist of vessels (armored and unarmored), of rams, and of movable torpedoes and torpedo-boats. We have a few armored vessels that could be used for harbor defence, though they are somewhat obsolete and armed and armored in an inferior manner. Still, they could form a basis to start with.

As, however, the question of armored vessels is closely bound up with the question of aggressive naval and foreign policy, I will waive that for the present, and speak only of the gunboats or gun-vessels, the rams, and the torpedoes. These are necessary adjuncts for a defensive naval policy. The gunboats are extremely useful vessels in time of peace, and also serve as aids for defence in breaking up boat parties, repelling parties at work countermining torpedo lines, and attacking and driving back reconnoitring gunboats and gun-vessels of the enemy's squadron. As cruising outposts in the vicinity of our principal ports, they would be most useful to convey the information of the approach of an enemy, and in numberless ways they would be of the greatest service. The Naval Advisory Board convened by Secretary Hunt recommended the construction of gunboats of wood. Changing the material of construction to steel, and following the type lately built for the Chinese, a gun-vessel could be built of great service for peace or war. These vessels, built by Sir William Armstrong after designs by Rendel, have a displacement of 1,300 tons, a speed of sixteen knots, and carry sufficient coal for steaming 4,000 miles. They are also armed with two ten-inch guns capable of penetrating eighteen inches of armor. Our tariff principles, in this case more illiberal than the Chinese, will not allow us to have Armstrong build us similar vessels; but we could certainly with wisdom copy the designs.

For offensive-defensive purposes the marine ram holds a high place in the estimation of many naval authorities, but there has been little experience either in building them or manœuvring with them. Any one who knows of the naval operations of the civil war will not fail to remember how powerful a disease "the ram

fever" was among the blockading vessels, and how nearly the blockade was raised at Charleston and the passes of the Mississippi by improvised and hastily-built vessels. Against ironclads a carefully-built and strengthened steel ram would be needed. A number of rams of the Ammen pattern was recommended by the original Advisory Board, and to a certain extent this recommendation was seconded by the present Advisory Board. One at least of these should be built at once, if only for experimental purposes; to delay building the first one of this novel class of vessels until war was upon us, would be, to say the least, highly imprudent.

Torpedo vessels are of several classes. The largest type, of which the *Alarm* is the only representative afloat in the service, is expected to be sea-going and self-sustaining. The principal qualifications necessary are speed, great facility in manœuvring, and also ease and celerity in discharging and generally manipulating the torpedoes which are carried. The *Alarm* does these to a moderate extent only, and Ericsson's *Destroyer* has not been perfected. Here is ample opportunity for American inventive ingenuity, and, with sufficient encouragement, doubtless something satisfactory can be evolved. Among other designs proposed, Nordenfelt, the inventor of the celebrated machine-gun, has offered the plan of a boat to be submerged and to carry Lay's locomotive torpedoes. A board of torpedo experts could decide upon the best plan to be built at once as an experimental ship. There are two types of torpedo-boats built by Yarrow and Thorneycroft of England that are marvels of skill and ingenuity. They were evolved from the torpedo launch of our civil-war period, and are constantly improving. In the United States the Herreshoff boats, though as yet inferior in some respects to the Thorneycrofts and Yarrows, can, with sufficient encouragement from the Government, be developed into boats of equal power. Of the Heneschoffs, the Navy Department possess but two, and those of wood and of an antiquated type and inferior speed. The Government should be prudent, and order at least two for each principal port on the Atlantic and Pacific coasts, to be built during the coming year. The third class of torpedo-boats are boats of the locomotive or automovibile plan, and are represented in general terms by the Lay, Whitehead, or Ericsson torpedoes. The last Congress appropriated a sum of money for the best torpedo of this class, and the purchase of the working plans and right to manufacture. This question will be decided by a board of competent officers, and will result in speedily acquiring, it is to be hoped, the most serviceable locomotive torpedo.

The Congress about to meet should supplement the action of the last Congress by appropriating money for the building of the vessels and torpedo-boats named above, and an additional appropriation should be made for the construction of modern steel ordnance and the purchase of Hotchkiss, Gardner, and Gatling multifire guns. Whatever may be said of the political methods of the present Secretary, and his personal treatment of some of the officers of the navy, it cannot be denied that he has shown executive energy and administrative capacity. By reducing and concentrating the establishments at navy yards, in closing some of the superfluous stations, in reducing the civil establishment at navy yards—an establishment subject to political abuse—and especially by stopping the crowding into the lower ranks of the service of superfluous officers, he has done a great deal in aid of economy and efficiency. He has also, in approving the sentences of courts-martial in cases of dismissal (an unknown thing of late years), done something to improve the discipline of the service. I trust that he will urge upon the coming Congress the creation of defensive *matériel* for the navy, and not let them remain satisfied with the building of a few commerce-destroyers. In doing this he will be furthering the possibility of peace in the future. C. H. S.

REPRESSION IN IRELAND.

To the Editor of The Nation:

Sir: Permit me to say that what I advocated as a temporary mode of trial in Ireland was not "a commission of judges," which, on the contrary, I deprecated, but a tribunal of laymen, selected for their character from the whole nation, without restriction to Ireland, and presided over by a judge. It seemed to me, and seems to me still, that such a court would combine the necessary independence of local passion and terrorism with all that is essential to justice in jury trial. The bill brought in by the Government, on the contrary, did enable the judges to try cases without juries, though the Government has preferred to act on another and, it appears to me, not less stringent provision of the bill. However, the form of the tribunal was a secondary question, and as such I always treated it. That which I, with many others, pressed "with vehemence," if you will, was the institution of some tribunal capable of protecting the lives of loyal men and women against gangs of barbarous and dastardly assassins. I cannot conceive anything more clearly demanded by the honor of the country. Surely the victims as well as the murderers have some claim on our humanity.

I do not quite know what you mean by "my talk about Irish matters when I was last in England." I delivered a lecture, which was printed, and in which I am perfectly confident that nothing sanguinary or wanting in right feeling toward Ireland will be found; but I made no speech. Whatever I did, however, you may be sure that you do me great injustice if you imagine that I had any object in view but the prevention, by timely firmness in vindicating the law, of the bloodshed which there has already been, and of that which, there is too much reason to fear, is destined still to come. I do not wish to see my country dismembered, but I wish to see its unity preserved by means consistent with humanity and justice.

Yours faithfully, Goldwin Smith.

Toronto, October 26, 1883.

RETROGRESSION IN ALABAMA.

To the Editor of The Nation:

Sir: In conversation with a gentleman in Illinois, just after the rebellion, upon the future of the South, he concluded by stating that "when he came to die he wished to be taken back to Alabama." "Why," said I, "you are not a native of that State." "No, sir; but having traversed its length and breadth during the late war, and become familiar with all its machinations, I feel that I could leave the world with less regret from Alabama than from any other portion of the civilized globe." Sojourning here for awhile, I have at times seriously questioned its being "a portion of the civilized globe"; civilization implying advancement in all that pertains to the comfort and happiness of mankind, whereas this entire section has retrograded during the past fifteen or twenty years almost beyond recognition, the people of all classes growing stoically indifferent to any improvement of their present surroundings or their future welfare.

Perhaps nothing has so much contributed to bring about this lamentable state of affairs as the mortgage system, or, in common parlance, "The Crop Lien Law," which obtained, just after the surrender, for the avowed purpose of aiding the poor farmer and freedman to begin life anew. The law as at first enacted, to remain in force one year only, stipulated that nothing but such supplies as were absolutely necessary for making and gathering the crop should be furnished, or, if furnished, should be at the risk of the merchant—not legally collectible; the farmer executing a lien on the crop he expected to make, and also a mortgage on whatever he possessed, in horses, cattle, hogs, etc., duly witnessed and recorded. However strongly it may be argued that this inured to the good of the country at first, I think it questionable, inaugurating as it did a new system of credit, based on presumed resources having no existence in fact, and calling into requisition the already wasted energies of a people at from two to three hundred per cent. discount. As the statute was extended from year to year, with numerous amendments, provisos, etc., one could easily see who were the beneficiaries; and each autumn, as the cotton rolled into the merchant's warerooms, and the teams and wagons that brought it were seized by the sheriff, it was not difficult to discern the loser. Moreover, so loosely has the law been construed of late that anything is furnished one may call for, each bidding particularly for the colored trade, because the freedman is simple and childlike in his wants, and there is no difficulty in selling him any article at any price, especially on time.

I once saw, on a wager between a merchant and another party, an iron column supporting a portion of the building sold for fifty dollars to one of his colored customers, who was persuaded that it would protect his cabin against lightning, and that he could pay for it at the close of the year in cotton. Again, I saw a merchant take a five-dollar note a freedman asked him to change, tear it apart, and cast it on the floor, pretending to grind it in pieces beneath his feet, then threaten him with arrest for uttering counterfeit money. The note was genuine, and he was seen to gather the fragments and put them together, and in all probability used the bill himself. Upon another occasion I was present when a young colored man, with his girl, entered one of these mortgage houses, and, asking for flavoring extracts, was handed a case of handkerchief extracts, from which he selected a small bottle of patchouly, being informed by the proprietor that it was the identical article he wanted, and for it was charged the moderate sum of two dollars and fifty cents.

These are but a fair sample of thousands of such tricks practised upon the poor, unsuspecting freedman under this nefarious mortgage system; and as each year rolls by, and he finds himself moneyless and powerless, is it any wonder that he should begin to cast about him for relief, especially when he beholds in the near future the holidays approaching, with no prospect of being able to gratify his childlike whims? For from time immemorial it has been customary for the colored people to have a little ready money for their Christmas, it being their "day of jubilee" throughout the South.

Cotton being the principal crop upon which the lien is given, and being at all times a cash article, it is but natural that he should give it his first attention, especially as it is wholly under his control until ginned and baled, being stored in outbuildings as fast as gathered. This stock of seed cotton pressing necessity, together with the conviction forced upon him from past experience that he will derive nothing from it in the end, impels him to dispose of in any way, regardless of consequences, there being always a class of small, unprincipled dealers only too anxious to get it, yet never paying over half-

price in cash or merchandise. To these buyers it is brought in after dark, in sacks containing from fifty to one hundred pounds. They are generally saloon-keepers, carrying also a small stock of trinkets, gewgaws, etc., many of whom have grown rich and plethoric from the trade of the colored people. In fact, to such an extent has this traffic been carried, that what has been called the "Sundown Law" was enacted by the General Assembly several years ago, prohibiting, under heavy penalty, any trade in cotton between the hours of sunset and sunrise. These saloon-keepers, having once got the freedman into their power, control him effectually, well knowing how this cotton was obtained, and compelling him at pleasure to continue his depredations until they have all they can handle, which is usually secreted about their residences or in some out-of-the-way place until a convenient opportunity is offered for disposing of the lot.

Taking these facts into consideration, is it any wonder there should be two hundred thousand more illiterate persons in the South to-day than there were ten years ago? Our colored population are all farmers—nine-tenths of them renters, compelled to pay thirty-five pounds lint-cotton per acre for old, worn-out land, requiring three acres to produce one bale. And yet necessity has compelled them to go on paying these exorbitant prices to soulless landlords when, for a little ready money, they can buy the same land for less than their annual rental; in proof whereof, a large tract of the best land in this county was sold by decree of Chancery, a few days since (title guaranteed), for only $2 75 an acre.

All these things naturally incite to discontent, theft, robbery, and frequently murder; for there is no confidence between man and man, everything that should in business affairs arouse one to life and energy is utterly destroyed, and the entire country is in a semi-barbaric state. So, when Congress made an appropriation for improving Muscle Shoals in the Tennessee River, and work actually began, it was but natural the freedmen should flock thither by the thousand, for the better and surer compensation offered for their labor, to say nothing of the difference in treatment received at the hands of their employers, and leave the old, worn-out fields to grow up in May-weed and sedge-grass, as is their wont when left untended. Consequently there was a great hue and cry among these landlords, who, accustomed to lie idle during the entire year, dependent solely on their rents for subsistence, were now compelled to mortgage their lands for supplies to carry them through. The old state of affairs was thus reversed, for the freedman could now pay cash for all he wanted, and have a little left; was fawned upon and caressed by the merchant, while his old landlord was bound and securely held by the same shackles that once fettered him, "with none so poor to do him reverence."

SOJOURNER.

NORTHERN ALABAMA, Oct. 20, 1883.

THE SOCIETY FOR PSYCHICAL RESEARCH.

TO THE EDITOR OF THE NATION:

SIR: As your readers will have learnt from a kindly notice of our "Proceedings" which recently appeared in your columns, a society, entitled the "Society for Psychical Research," has lately been established, under the presidency of Mr. Henry Sidgwick, Deputy-Professor of Moral Philosophy in the University of Cambridge, England, for the purpose of inquiring into a mass of obscure phenomena which lie at present on the outskirts of our organized knowledge. May we ask you to find space for a few lines as to the mode in which persons interested in our investigations may give us valuable help?

It is an object of this Society to get hold of as much first-hand evidence as possible bearing on such phenomena as thought-transference; clairvoyance; mesmeric healing; presentiments and dreams, noted at the time of occurrence, and afterward confirmed; unexplained disturbances in places supposed to be haunted; apparitions at the moment of death, or otherwise; and of other abnormal events, hard to classify at present, but which may seem to fall under somewhat the same categories as these.

We have been desired, as Secretaries of the Literary Committee of the above-mentioned Society, to invite information of this kind from any trustworthy source. It is clearly of great importance, considering the universal diffusion of these phenomena, that evidence should be drawn from as wide an area as possible.

Should any of your readers, now or in the future, be able and inclined to send us an account, or put us on the track, of any phenomena of the kind which may have come under the cognizance of themselves or their friends, they would greatly oblige us, and would also (as we think we may fairly say) be rendering a real aid to the progress of knowledge in a direction where such aid is much needed. Nothing will, in any case, be printed or published (either with or without names) except with the full consent of the persons concerned.

EDMUND GURNEY,
Devonshire Club, London, Eng.;
FREDERIC W. H. MYERS,
Leckhampton, Cambridge, Eng.

OCTOBER, 1883.

ORIGIN OF THE PHŒNICIAN ALPHABET.

TO THE EDITOR OF THE NATION:

SIR: A review of Taylor's 'Alphabet,' in the *Nation* of October 11, appears to accept the theory of the Egyptian origin of the Phœnician alphabet as definitively proved. I will state briefly certain unanswered objections to that theory:

1. The resemblance of the hieratic Egyptian to the early Phœnician characters is not striking; it is, however, such as to render the development of the one from the other possible. This proves absolutely nothing whatever, since, as Doctor Taylor has successfully shown in the course of his two volumes, anything may be developed from anything. What is needed for a proof in this direction (and the same is, only in a still greater degree, true of the theories of the Hittite or Babylonian origin of the alphabet) is intermediate forms. Too many links are wanting to allow the construction of a sound argument on the ground of the forms of the letters.

2. As Doctor Taylor says, in reference to the derivation of the Æthiopic alphabet (vol. i., p. 353): "The identification of the letters with their Phœnician prototypes can be effected with much greater certainty [by a linguistic comparison of the names] than by means of mere resemblances of form, which are frequently deceptive." Comparing the Egyptian and Phœnician alphabets, we find no similarity in the names of the letters, either as to sound or meaning. In answer to this objection, Doctor Taylor adduces the example of the derivation of the Russian alphabet from the Greek, etc. (vol. i., p. 119). By an application of the acrological principle, *beta* became in the Russian alphabet *buki*, "beech"; *delta* became *dobro*, "oak." From this analogy he argues (p. 120): "Hence new acrologic names, significant in Semitic speech, would naturally be invented, as in other borrowed alphabets [compare for an opposite course the Greek], with the object of making it easy to connect the forms and values of the several characters." The analogy does not hold, and the argument is invalid, because a number of the Semitic letter names—more than half-a-dozen—are entirely without significance. They are not Semitic words, and yet they are not borrowed from the Egyptian.

3. In vol. i., p. 122, Doctor Taylor says that the "Egyptian alphabet" consisted of twenty-five letters, of which some were vowels. What became of those vowels, if the Phœnician alphabet was borrowed from the Egyptian? To omit what existed is inconsistent with the supposition of progress. The need of some method of expressing the vowels was undoubtedly felt among all Semitic peoples, as is shown by the attempt to indicate different vowel sounds by means of *aleph*, *vav*, and *yodh*, by the syllabic system finally adopted in Æthiopic and Mendaïte, and by the ultimate adoption of vowel points in the other Semitic languages. A minor objection of a similar kind is the combination under one character, *cheth*, of two different sounds. To follow Doctor Taylor's own argument regarding *teth* and other sounds peculiar to the Semitic languages (p. 117), inasmuch as the number of symbols in the Egyptian alphabet was sufficient for such a purpose, separate characters should have been chosen—from among the breaths, I suppose—for the two sounds now combined under the name *cheth*.

4. On p. 145 Doctor Taylor sums up his argument as to chronological probabilities as follows: "The Semitic occupation of Egypt lasted for several centuries. The origin of the Semitic alphabet is connected with this occupation by three distinct lines of evidence. The first is external. The sojourn of Israel in Egypt is nearly synchronous with the Hyksos period. Before the Hebrews went down into Egypt the art of writing was unknown to them: when they came out of Egypt they possessed it. The inference seems clear—it must have been acquired from kindred races who occupied the Delta." Sentences one, four, and five are assumptions of unproved facts, consequently the inference drawn is also an assumption. We are really in entire ignorance regarding these matters.

There are other minor objections which need not be stated here. The argument for the Egyptian origin of the Phœnician alphabet is, in fact, only this: The Egyptians, although they did not themselves know how properly to use it, had developed an alphabet at a time, apparently, when the Phœnicians were in sufficiently close contact with them to have borrowed or adopted it. We have no satisfactory evidence that before the time of such contact the Phœnicians possessed any system of writing; that is, we are in total ignorance on the subject one way or the other. In the absence of any proof of another derivation of the Phœnician alphabet, these facts give a probability to the Egyptian theory in spite of the objections mentioned above. Such absence of proof cannot, however, be regarded as ultimate until we know far more than we do at present about the Hittite and other systems of writing of hither Asia, and also about Assyrian-Babylonian. Hence the probability arising from this absence of proof must for the present be treated as merely provisional. As Doctor Taylor says, the discovery of Phœnician inscriptions of the year 1500 B. C., or thereabouts, may any day solve the problem; but, as he does not say, I think it must for the present be regarded as an open question, with the probabilities inclining toward Egypt. In conclusion, let me add that it is a mistake to say that classical tradition is in favor of the Egyptian theory. Classical tradition is about equally divided between the Egyptian and the Assyrian (which

may cover Babylonian) origin of the Phœnician alphabet. JOHN P. PETERS.

NEW YORK, October 26, 1883.

Notes.

CUPPLES, UPHAM & Co., Boston, have nearly ready Turgeneff's 'Poems in Prose,' with an introduction and portrait.

Pickwick & Co., Philadelphia, have in press and will shortly issue 'American Greek Testaments: a Critical Bibliography of the Greek New Testament as published in America,' by Prof. Isaac H. Hall, of which the public had a foretaste last year in the Transactions of the American Philological Association. The edition will be limited; the copies either cut or uncut, at the purchaser's pleasure.

A. D. F. Randolph & Co. will publish immediately 'Sources of History in the Pentateuch,' six lectures by Samuel C. Bartlett, D.D., President of Dartmouth College; and 'The Yoke of Christ, in the Duties and Circumstances of Life,' by the Bishop of Rochester.

Messrs. J. B. Lippincott & Co. announce for immediate publication Mary Agnes Tincker's new novel, 'The Jewel in the Lotos,' with five handsome full-page illustrations by Hovenden.

Houghton, Mifflin & Co. will publish next month Longfellow's dramatic poem, 'Michael Angelo,' in folio form, with designs by eight American artists, and other illustrations pertaining to Michael Angelo and his friends from old paintings and engravings. There will be three portraits of Vittoria Colonna. The book will be conspicuous among holiday publications.

Mr. Edmund Goldsmid, 12 Castle Street, Edinburgh, invites subscription to his 'Bibliotheca Curiosa,' "a collection of curious and out-of-the-way books, intended for the historian, antiquarian, and littérateur." The list embraces forty-three numbers, with a range that includes James Maidment's 'A North Countrie Garland'; Mr. Goldsmid's complete catalogues of the publications of the Aldine press at Venice (1494–1597), and of the Elzevir presses at Leyden, Amsterdam, and Utrecht; Grotius's 'De Origine Gentium Americanarum Dissertatio'; Capefigue's 'Agnes Sorel,' in translation; Caxton's 'Reynard the Fox'; the 'Trial of François Ravaillac'; Wright's Camden Society edition of 'The Political Songs of Britain, from the Reign of John to that of Edward II.'; King James's 'Counterblaste to Tobacco'; Thomas Prince's 'Chronological History of New England' (1736); Dame Juliana Berners's 'Treatyse of Fysshynge with an Angle'; a translation of Lamartine's 'Christopher Columbus,' etc. The editions will be limited, with print and paper of the best, and in two sizes. Subscriptions may be made for a set, up to a certain number, or for separate volumes.

Mr. Alfred Marks, 155 Adelaide Road, N. W., London, having transcribed for his own use Venturi's rare biographical tract on Leonardo, of which only three copies are to be found in the libraries of London, is prepared to reprint it if subscribers enough agree to pay the moderate cost. He may be addressed as above.

Mr. Goldwin Smith's *Bystander* is to be suspended in favor of a new critical and literary periodical called the *Week*, of which the first number will be issued in Toronto on December 6, with Mr. Charles G. D. Roberts for editor. Mr. Smith will be a regular contributor to one at least of its departments.

The "Newstead edition" of Lord Byron's complete works (Philadelphia: E. Claxton & Co.) has the merits of being contained in a single if bulky volume, of giving a sufficient life of the poet, based on the freshest histories, and of having a good index to names, titles, subjects, and first lines. Perhaps we should add the illustrations, even if they are copies; and such comparison as we have made indicates careful proof-reading of the text. But as a manufactured article the book falls below the accepted standard of taste, and is not one which a lover either of Bryon or of poetry would cherish. It is uniform in style with an "Avon Shakspere" by the same publishers.

The 'Riverside Shakspere,' edited by Mr. Richard Grant White, in three volumes (Boston: Houghton, Mifflin & Co.), whether it meets a want or not, will certainly find general acceptance. Mr. White is responsible for the text, and we need not hesitate to trust him for that, even though he very seldom records various readings. He puts his glossary in footnotes instead of by itself, and he repeats his explanations with every fresh occurrence of the word or phrase at a distance from the first—not always, indeed, but such is his intent. The pages have numbered lines. A brief introduction, giving what is known about its origin, precedes each play. The whole is prefixed with an introduction and a summary life of the poet. In the former, Mr. White shows how remote from public interest are the contentions of Shaksperian commentators, and then neatly gives a few samples of his own latest work in this vein, upholding, with the confidence of his class, original emendations of this, that, or the other passage. The few known facts of Shakspere's life are related in a way to impress the reader with his sordidness, overfondness for drink, unchastity, and small regard for his wife. The good is pretty much left to be interred with his bones. It cannot be said that the facts are distorted, but they have certainly been robbed of charitable perspective. The print of these comely volumes is large and, in spite of the rather thin paper, legible.

The *Century* Company has recognized the general interest created by Dr. Gladden's "The Christian League of Connecticut," in printing in book form the papers which appeared in the *Century Magazine* under that title. These vigorous and sprightly essays on organized charity and coöperative church work are already well known. The author was wise in pitching upon a town no larger than "New Albion" for the scene of the operation of his theory. The "League" could not have had origin in a large city—at least, not such an origin—and it may be doubted if it could be put into successful working there, since it implies so thorough an acquaintance on the part of one minister with the persons and churches of each of the others. Part of the work proposed is already done, in a different and probably better way, by the societies for organizing charity which exist in several large cities, as, for instance, in Buffalo. The blows dealt denominational rivalries are well directed and telling. The "ministerial famine" over which some of the denominations are greatly exercised of late is an affair only relative to particular sects, and without basis in the demand, broadly considered. We presume that Doctor Gladden has had his full of the amenities of temperance discussions since his removal to an Ohio church. The book is published both in paper and cloth.

Two more volumes—'Wet Days at Edgewood' and 'Dream Life'—have been added to the uniform edition of the works of Donald G. Mitchell now publishing by the Messrs. Scribner.

G. P. Putnam's Sons have made three tempting little volumes of 'Prose Masterpieces,' containing essays one would always like to have at hand, such as Matthew Arnold's "Sweetness and Light," Leslie Stephen's "Apology for Plain-speaking," Lowell's "On a Certain Condescension in Foreigners," Macaulay on "History," Morley on "Popular Culture," and many others, often in a calculated juxtaposition by contraries. Thus Froude and Freeman, Newman and Stephen, are brought together. The list embraces also Leigh Hunt, Irving, Lamb, De Quincey, Landor, Sydney Smith, Thackeray, Emerson ("Compensation"), Gladstone ("Kin beyond Sea"), Helps ("On the Art of Living with Others"), Kingsley, Ruskin, and Carlyle. The binding of these volumes is as choice as their contents.

The same publishers have brought out a new and revised edition (the second) of Mr. C. F. Thwing's 'American Colleges: Their Students and Work.' The author has added three chapters, one being on wealth and endowment, another an argument against a national university, and a third in favor of coeducation. This work answers a good many questions which foreigners are apt to ask concerning our colleges and the benefactions which support and multiply them.

'Mr. Washington Adams in England' has been reprinted in Glasgow by Mr. David Douglas in one of the pretty little volumes of the series containing the writings of Mr. Howells, Dr. Holmes, Mr. Cable, and Mr. Stockton, and about to contain Mr. Curtis's 'Prue and I.' Now that Mr. Grant White has acknowledged the writing of the 'New Gospel of Peace,' it is perhaps a pity that he did not include in this reprint of a stage-American's sayings and doings in England a reprint of the earlier pamphlet called the 'Diary of Sir Lyon Bouse in America,' in which were set down the sayings and doings of a stage-Englishman in these United States. The contrast in form and the substantial unity of impression after the score of years which intervenes between the two pamphlets are worthy of remark, whatever may be thought of the permanent value or conciliatory effect of either.

In continuation of a correspondent's list of articles which go to show the rapid Americanization of England, it may be mentioned that Marsh's 'Lectures on the English Language,' March's 'Anglo-Saxon Reader,' and Whitney's 'Life and Growth of Language' are among the text-books recommended to candidates for the higher local examinations of the University of Cambridge. It is a little singular that the training of English girls in their native tongue should be intrusted to writers of a nation which is supposed to have done so much to corrupt that tongue.

Both the leading articles of *Le Livre* for October arrest attention and repay reading. Antoine Fureteur recalls the loyal outbursts of joy, and pious fervor, and reckless prophecy at the time of the birth of the late Comte de Chambord—"l'enfant glorieux," according to Victor Hugo; "l'enfant du miracle," according to Lamartine. The Opposition were, of course, less happy and less exuberant. M. Fureteur cites from the contemporary *Quotidienne* what must have been already an old Joe—the story of the barber who exacts double pay for shaving a downcast Liberal customer: "mais aujourd'hui vous avez la figure beaucoup plus longue." As might be expected, the loyal poetry is most amusing of all. The second paper is a chapter from volume i. of M. Eugène Dutuit's 'Manuel de l'amateur d'estampes,' discussing the question, Who invented the art of printing? M. Dutuit sets forth the elements of the controversy with great fairness, but without throwing much independent light upon it, and without coming to any dogmatic conclusion. He holds to Holland rather than to Germany, but he does not insist on the truth of the Coster legend. Among the bibliographical notes of this number we read a statement that the only extant portrait of Balzac, a daguerreotype, was

broken to bits by the Prussians who occupied Charles Yriarte's house at Saint-Cloud. *Le Livre's* English proof-reading commonly leaves something to be desired, and its New York correspondent is made to attribute to General Dix the "lambeau de phrase mirobolant," "Shook him on the Spok."

Octave Feuillet's one-act comedy, "La Fée," is the latest issue (No. 6) of Mr. Wm. R. Jenkins's "Théâtre Contemporain."

Professor Young, embracing the favorable opportunity of the opposition of Uranus early in the present year, conducted an important series of observations bearing on the ellipticity and surface-markings of the planet. The former make it quite certain that Uranus, like Jupiter and Saturn, has a rapid rotation nearly in the plane of the satellite-orbits. Professor Young's observations establish the certainty of markings on the disk of Uranus resembling the belts of Jupiter and Saturn. They were seen only faintly, of course, but repeatedly by three observers independently, whenever the conditions of vision were good and the image bright and steady. On May 25, for example, the western pole was notably brighter than the eastern, and the western belt showed a little spur running out toward the pole. It does not seem to be possible to deduce any reliable rotation-period from the data so far collected, but there is certainly reason to hope that some of the great telescopes may establish something more definite in future years.

— A new analytical index to the *Nation*, supplementary to that of 1880, may now be had of the publisher of this paper. The latter was essentially literary in its scope, and paid little regard to the political side of the *Nation*, which is the exclusive concern of the present work. To this the compiler has given the title, 'A Record of Politics and Politicians in the United States, 1865–1882'; and to enlarge its usefulness he has occasionally referred to McPherson's Political Handbooks, and to other easily accessible sources. For convenience' sake he has adopted the style of the earlier Index. No such record has, we believe, ever been attempted in this country, and the mere perusal of it, without turning back to the *Nation*, is very instructive. Its value in the manufacture of "campaign documents" (see the bird's-eye view of Butler, for example), the preparation of dictionaries of "Men of the Time," or the serious study of contemporary American history, will be appreciated by the respective classes that have occasion to resort to it. As a stimulus to the well-known sluggishness of the American memory, its utility is not confined to those who have a file of the *Nation* at hand. Foreigners, moreover, can learn from it what is meant by the Americanism, a man's "record."

—Most people who take up *Harper's* for November will fall at once with avidity upon the account of a "Hashish-house in New York," given by Dr. H. H. Kane, M. D. In Forty-second Street, somewhere between Broadway and the North River, there is, we are told, what may be vernacularly called an élite hashish resort, where ladies and gentlemen in the custom of using hemp in any of the pleasing Oriental ways, go from time to time for the purpose of indulging in those delightful visions which hashish produces—not the demi-monde, or the low creatures who drug themselves in opium-joints, but real ladies and gentlemen of our best, oldest, and wealthiest families, who go there just as they might to a Turkish or Russian bath. It is a very luxuriously-furnished mansion, recalling, in some of its appointments, the peculiar class of abodes to be met with in the romances of the late Lord Beaconsfield. The floor of the principal room is covered with a velvety carpet, in which the feet of the visitor sink "almost ankle deep," the design comprising beds of flowers, parterres made up of "thousands of rare exotics and richly colored leaves," such as no gentleman likes to have his lawn without, but which few gentlemen perhaps would like to see in the pattern of their parlor carpet; a brook, moreover, creeping between damp green banks, fringed with coy violets and bluebells, to say nothing of the serpentine gravelled walk, which meanders through this smiling scene. This carpet, surprising as it may seem, is designed to reinforce the agreeable effect of the hashish; to judge by the description, the sight of it would be more likely to produce a nightmare than a pleasant reverie. In fact, to our minds nothing could give a more vivid idea of the potent effect of hemp than the fact that, with such a floor expanding about him and presenting its horrid images to his consciousness, as it passes into the domain of dreams, the drug should prevail against the floor, and actually produce in the hashish consumer a sense of comfort and well-being. The doctor says nothing of the effect of the carpet on awakening; in fact, for a scientific man he has not sufficiently discriminated the effects of the carpet from those of the drug. We do not mind confessing that we still have doubts as to the existence of this house in Forty-second Street, notwithstanding Doctor Kane's minute description; we cannot help believing that the vigilant reporters of some newspaper would have discovered its existence long ago, and given the public some accounts of its whereabouts, as they have faithfully done in the case of the opium dens, the gambling-houses, and all other really-existent places of an illicit character. That a monthly magazine should beat the daily press in disclosures of this sort is improbable. Still we should like to believe in it, just as we should in the shop in Fourteenth Street where, according to a recent English writer, parcels of cigarettes are made up and sent home to ladies who surreptitiously smoke tobacco, in shapes which resemble ordinary "dry goods." All these things make life in New York more "full" and various.

—*Lippincott's*, which sometimes has a little the air of being made up of contributions returned as "not available" by other magazines, opens with a rather commonplace illustrated article on Henry Irving, by Robert Laird Collier. Irving is likely to be for some time to come a "topic," and we confess to having looked forward with eager anticipation to the moment, which has now come, when there will be some independent and novel criticism of him which will serve to clear up the questions always suggested yet never answered by the accounts thus far given of his strange elocution and eccentric acting. "Housekeeping in Normandy," by Margaret Bertha Wright, is a readable article, in which the extraordinary economy of French cooking is dwelt upon, and what will strike most American housekeepers as a convincing illustration given. Not a drop of the water in which vegetables are boiled is ever wasted, it seems, in a Norman kitchen, but, "with a dash of milk, and a little pork fat or butter," it becomes "a good soup-vehicle with which to consume dry bread." Lavishness and waste is the peculiar "note" of the American cuisine, and we doubt if any amount of preaching would induce a "plain" cook in this country to get up a soup of this kind. The poorer Norman peasants, it seems, often eat boiled pea-pods as a vegetable. In New York there are numbers of Italian, French, and German cooks who get up every day what are known as "table d'hôte" dinners at the small price of from seventy-five cents to a dollar and a quarter, including the half-bottle of the wine of the country, as it may well be called; and this meal—an excellent one in its way—could not be served were it not for the economical habits imported from European kitchens; but the success of these makes no converts among American cooks. The typical American meal is probably still to be seen in the hotel kept on the American plan, where you pay a price sufficient for two people, and eat as much as you can without any question being asked, with a proud consciousness of superiority to details that a savage might envy.

—The *Atlantic* has a more than usually varied list of articles. Mr. Crawford's "Roman Singer" has now run through ten chapters, and, considering the furore with which the appearance of "Mr. Isaacs" and "Doctor Claudius" were greeted, we do not understand the quiet that prevails about it. It is at least as good as the first, and promises to be far better than the second, of its two predecessors; and, unless we are much mistaken, Mr. Crawford is more at home in Italy than he is either in India, Germany, or America. There are traces in the present instalment of his passion for the fantastic, as in the love parable of the Maiden and the Thorn; but this is a slight matter in a love-story. At the risk of seeming disrespectful to the novel-reading public, we are inclined to suspect that "A Roman Singer" does not attract its attention thus far mainly because it is too good, and that if Mr. Crawford wishes to give it greater vogue, he will do well to introduce, without further delay, some jewel-eyed polygamist from the far East, or some German Monte Christo from Heidelberg, or, better still, one of those vulgar materialists who, in the imagination of so many Europeanized Americans, make up the greater part of the best society of New York and Boston. A sketch of Ezra Ripley, by Mr. Emerson, originally written for his friends in Concord, gives an entertaining and life-like portrait of the old-fashioned New England minister, of the last quarter of the last and first quarter of the present century. It contains a number of anecdotes which give us a better picture of the society in which he lived than a volume of ordinary history could. His confident feeling as to his standing and influence with the Almighty is very significant, as in the story of his ordering the Rev. Mr. Goodwin off the ground, and taking charge of the prayers for rain, giving as a reason that the prevailing drought was altogether too serious to be prayed against by "young Cambridge men," or anybody but himself. Customary as it is nowadays for bright young agnostics to express serious doubts as to the "ages of faith," and the amount of religious belief actually then existent in the world, we do not see how it is possible for any one to gain even a superficial acquaintance with New England society as it existed a hundred years ago, without seeing that it was founded upon a real, living belief in the daily and hourly dependence of man upon a local, anthropomorphic divinity —a God not merely human, but distinctly Yankee in character. In this respect, the Jehovah of the New England system is not exactly what Mr. Matthew Arnold would call "Hebraic." Mr. Charles Dudley Warner's "Random Spanish Notes" are open to the criticism, that while good enough in themselves, they are somewhat spoiled by a vacillation of the style between that appropriate to a cosmopolite observer and that which is part of the outfit of the American humorist. The latter, represented best perhaps by Mark Twain, simply applies to what he sees in Europe the standards taken from every-day American life; the result being generally surprising and often amusing. Mr. Warner does this occasionally, but not with the bold,

free touch of the professional funny man. He is hampered by his sense as a literary man that Europe looked at in this way becomes mainly a laughable jumble of contradictions.

—Mr. James has in the *Century* the first instalment of a story called "The Impressions of a Cousin," of which the scene is laid in New York, the cousin whose impressions are recorded being a young woman sufficiently denationalized to see what goes on about her with the eyes, not of the children of Broadway, but of the children of light, though not, perhaps, sweetness. The magazine outdoes itself this month in illustrations. It has full-page portraits of Modjeska, Queen Victoria, and Turgeneff, the last having been engraved to accompany some reminiscences of the Russian novelist by Daudet. But Turgeneff was one of those writers whose books are not the reflection of their private lives, and any one who can trace a connection between his stories and the fact that he was a friend, and to the extent of a monthly dinner, a *convive*, of Flaubert, Zola, De Goncourt, and Daudet himself, is welcome to do so. The article throws a curious incidental light upon Daudet's opinions of the modern French *salon*, as represented by Madame Adam's evenings. To a party at this lady's house, it seems, Turgeneff on one occasion took the Grand Duke Constantine. "I hasten to say," Daudet maliciously adds, "that he saw nothing but attitudes—attitudes of people who pretended to turn their back, and of others who presented themselves as fully as possible. Alexandre Dumas, furious at being taken for a curious animal, refused to say good things. Carolus Duran, the painter, sang; Munkácsy whistled; M. de Beust played a pretty valse, which was rather long." Perhaps the following—when we recall Turgeneff's unfailing faith in the interest of mankind in the analysis of suffering—is as noticeable as anything in the article. He had an operation performed without taking chloroform, and afterward gave a minute account of his sensations to Daudet. First, he said, there was "the sharp pain of the blade in the flesh; then a circular sensation, as of a fruit being peeled," and he added: "I analyzed my suffering so as to be able to relate it to you, thinking it would interest you" And he was quite right.

—The *American Law Review* for September-October contains an important article by John Norton Pomeroy on "The Supreme Court and State Repudiation," which embodies a scathing review of the recent Virginia and Louisiana decisions. He takes the ground which we did in these columns some time since, that the idea advanced in the published opinion, that the "coupon-killer" laws in Virginia (this is perhaps the plainest case) did not "impair the obligation" of the contract with the creditors of the State, is unintelligible, because practically they took away the remedy which the creditor had (by mandamus), and gave him nothing in return. The matter is much complicated, however, by the intimation thrown out by the court, that nothing in the case is intended to affect the right of the creditor to make a tender of his coupons for taxes, or the duty of the State officers to accept them at their peril, followed as it has been by a decision of the Circuit Court that this course is still open to the bondholders. But Mr. Pomeroy goes beyond the discussion of this question, and declares that the court is in many ways showing signs of a tendency to depart from settled rules of construction, and to enlarge the scope of State legislation, dangerous to property rights. He finds this tendency not only in the Virginia and Louisiana cases, but in the elevator (granger) decision, in which the court decided that elevator charges might be fixed by State legislation, and that this did not infringe any of the Constitutional guarantees with regard to property. Yet this decision was rendered by the same court which has decided that any interference with the beneficial use of real property is a "taking" within the meaning of the clause relating to taking private property for public use. Mr. Pomeroy goes so far as to undertake to explain the present position of the court as resting upon, or at any rate necessarily involving, a dangerous and new theory of constitutional interpretation, which in its paralysis of the implied restrictions on State power would go beyond the view of the old secessionists.

—Professor Holden, having lately examined the excellent compilation by Sergeant Finley, of the Signal Service, 'Characteristics of Six Hundred Tornadoes,' with reference to the question of saving human life, describes in *Science* a simple apparatus which he has devised for a system of local warnings. Saving property seems to be out of the question, as no structure can withstand the force of the tornado-wind. Life may be saved by recourse to underground shelters, cellars, etc., such as have actually been built in many places for this end. He quotes two facts from the work named: (1) Three hundred and forty-seven out of 393 tornadoes (that is, 88 per cent.) originated between the west and the south-southwest points; (2) The average velocity of progression was about one mile in two minutes. It seems probable that in the future it may be practicable for the general weather service at Washington to send out warnings a day in advance to large regions of country within which tornadoes are likely to occur; but there is no prospect whatever that warnings of any particular tornado can be given in the immediate future. A five-minutes' warning at any of the late tornadoes might have saved many lives. A wind of seventy miles an hour is sufficient to blow down chimneys and to unroof houses, unless they are well built. Ordinary trees will not stand under it. The pressure on a square foot is not far from fifty pounds. Professor Holden finds it practicable to erect, at a moderate expense, an apparatus which will give from three to five minutes warning to all the inhabitants of a small town, by the firing of a cannon, for instance; and in addition, and without any increased expense, this apparatus could ring a bell in every house. Two or three miles outside the town, and along that quarter from which the approach of tornadoes is to be feared, he would run a line of single telegraph-wire, and from the west point bring the wire into the town, letting it end at the telegraph-office. The battery and ground connections are appropriately so made that a constant current is sent over the line, and a magnet in each house holds a detent which prevents the ringing of a bell so long as the circuit is closed. If the circuit is broken anywhere along the line, each bell begins to ring, and continues to sound until its spring is run down. A cannon could be fired by a suitable modification of the same device, to warn persons out of doors to seek shelter. Professor Holden indicates the detail of his very practical device for the automatic breaking of the circuit by the pressure of the wind, the essential part of which is a thin wire, ordinarily a part of the circuit, and which is so arranged as to be broken whenever the pressure of the wind on an indicator-board with which it is connected exceeds a given amount. Any desired number of such automatic attachments are erected on the poles along the line outside the town, and the action of any one of them is sufficient to send the warning along the entire line. He has made one such indicator, and finds it to work in a perfectly successful manner, being so adjusted, for trial, that the circuit is broken at a wind-velocity of about ten miles an hour. Reflecting that in this year alone several hundreds of lives have been lost from the violence of tornadoes, it will appear that the question of erecting telegraphic systems for local warnings ought to be seriously considered by persons living in exposed regions.

—Within the past few months a number of important works have appeared on the diminishing rate of increase in the population in France. The note was sounded last year by the volume of M. Raoul Frary entitled 'Le Péril National,' was echoed by Charles Richet in the *Revue des Deux Mondes*, and now is taken up by W. Grossrau in the last number of the *Vierteljahrschrift für Volkswirthschaft*. It appears from the article of Herr Grossrau that the average annual increase of population in France has been almost invariable since the beginning of the century, and is about 95,039; while during the last ten years the annual increase in Great Britain has been 340,118, in the German Empire 493,360, and in the United States, 1,155,446. These figures, showing the total increase, are not more striking than those giving the relative growth of the several states. For every 10,000 inhabitants the annual increase in the United States has been 260, in Germany 115, in Great Britain 101, while in France it is only 26. The rate of increase in France appears, moreover, to be steadily diminishing. Since 1872 the excess of births over deaths has fallen from 172,936 to 96,647. Even deducting from the increase in Great Britain and Germany the total number of emigrants from those countries, we still have an annual net increase in Great Britain of 276,623, and in Germany of 564,094 as against 93,854 in France. The death rate in France is not unfavorable. While in that nation the annual rate is 1 in 450, in Germany it is 1 in 400, in Italy 1 in 340, in Austria 1 in 310. In Great Britain alone, where it is 1 in 500, is the rate less than in France. The low rate of increase with the French, therefore, is to be sought in the small number of births rather than in the large number of deaths. Statistics cited by the author show that the number of births per 1,000 inhabitants has steadily diminished since the beginning of the century. From 1801 to 1810 the rate was 32.5 per 1,000; from 1821 to 1830, 30.9; from 1841 to 1850, 27.4; in 1876, 26.2; in 1879, 25.1. In the table given by Herr Grossrau there is not a single year in which the rate is not a fraction less than it was in the year preceding. Meanwhile the rate of marriages has remained almost invariable. At the beginning of the century the annual number of marriages per 1,000 inhabitants was 7.89. During the eighty years it has not fallen below 7.05, nor risen above 8.02. The cause, therefore, is not to be attributed to any growing infrequency of marriage.

—It is interesting also to note that the diminishing number of births seems not to be confined to the cities, but is characteristic of the rural districts as well. Since 1801 the rate of births per 1,000 inhabitants has fallen in the Pyrénées-Orientales from 44 to 32; in Rhône from 36 to 26; in Tarn from 34 to 25; in Indre from 37 to 27; and in La Creuse from 33 to 23. While in Germany the average number of children per marriage is 5.25 and in England 4.79, in France it is only 3 31. The total rate of births among the French is 26 per thousand, while in England it is 35, in Austria 38, in Prussia 38.5, in Saxony 40, and in Russia 50. We may even speculate as to what the result will be if the present rate is maintained for fifty years. Making no calculations for any disturbance by war or famine or

any other cause, we find that France will have advanced in millions of inhabitants from 37 to 44; Great Britain from 36 to 63; Austria from 38 to 51; the German Empire from 46 to 83; Russia from 90 to 158; and the United States from 52 to 190. Though, as Herr Grossrau remarks, there is a law against the trees growing to the heavens, the figures which he gives furnish much food for thought.

THE CONFEDERATE CRUISERS.

The Secret Service of the Confederate States in Europe; or, How the Confederate Cruisers were Equipped. By James D. Bulloch, Naval Representative of the Confederate States in Europe during the Civil War. G. P. Putnam's Sons. 2 vols., pp. 460–438.

As indicated by the above title, Captain Bulloch was the officer selected by the Confederate authorities to organize and equip their naval demonstrations from abroad, and his operations are related in the two large, somewhat loosely jointed, but interesting volumes under consideration. At the outbreak of the civil war the South found itself singularly barren of materials or resources for the creation of a navy. Beyond a few merchant steamers of indifferent character in its ports, there were no vessels within reach to meet the naval ships of the North, which, for their period, represented a more efficient and complete naval force than we now possess. There was but one shop in the whole Confederacy capable of turning out a first-class marine engine, and no available yards for ship-building. The Pensacola and Norfolk yards, it is true, were for a time in possession of the Confederates, but the former was a place of repair, not of construction; and the latter, when it fell into their hands after its unnecessary evacuation by the Federal forces under Commodore McCauley, in April, 1861, was already rendered useless for the despatch of cruisers by the enemy's occupation of its outlet at Hampton Roads. This latter yard, it is worth remark, in passing, supplied the Confederates not only with the hull and engines out of which the *Merrimac* was created, but also with what Captain Bulloch fails to notice particularly, a store of heavy artillery (at least twelve hundred guns, according to Soley, Parker, and other authorities) sufficient to provide for their immediate need. It was with these guns that the Confederates equipped their otherwise comparatively inoffensive coast-fortifications and gunboats, and found material for the effective thirty-two-pounder rifled and banded pieces which they so cleverly improvised.

Under these circumstances, the attention of the Confederate naval authorities was early turned to foreign sources for the development of the insignificant germ of a navy then in hand. Accordingly we find, as probably one of the last letters coming through the mails which as yet reached the North from the seceded States, a communication, dated April 23, 1861, from Judah P. Benjamin, then Secretary of State under the Montgomery Government, requesting Captain Bulloch, at New York, to come forthwith to Montgomery. Arriving there a few days later, he was despatched to England on the following day, under brief instructions, the execution of which led to the events which form the subject of his book. It is interesting to observe that in the brief colloquy which Captain Bulloch had on this occasion with Mr. Mallory, then the Secretary of the Navy of the Provisional Government, and afterward holding the same post under the Confederate Government, it appeared that, although the Montgomery authorities ultimately expected a formal recognition of their Government by foreign nations, nothing but the comity of the latter to a belligerent was sought, or expected to be invoked, at that period.

Arriving in England in June, 1861, Captain Bulloch found himself without funds or a status sufficient to render his task encouraging, and with the formidable Foreign Enlistment Act staring his enterprise in the face. This statute, since amended, and afterward largely considered in the *Alabama* case at Geneva, forbade any person to "equip, furnish, fit out, or arm" any vessel within the realm for the purpose of making war on any foreign state or persons, and provided, in the event of its violation, not only for a forfeiture of the property, but certain penal features applicable to the parties concerned. Sufficient as the provisions of the act would seem, at first blush, to prevent his purpose, Captain Bulloch, as the event proved, found a way, if not to "drive a coach and four" through it, at least to slip through a few cruisers. Taking advice of eminent counsel, he found he could (as in fact he did) *build* his ships within Her Majesty's dominions, leaving the work of supplying their *equipment—i. e.*, the necessary appliances for warfare—to be performed elsewhere, whether in obscure foreign ports, by the aid of tenders which took the materials out as ordinary merchandise, or otherwise. With this construction of the existing law to stand upon, in spite of many obstacles thrown in his way by the zeal of Mr. Dudley, the United States Consul at Liverpool, and Mr. Adams, the American Minister, and even of difficulties arising from the indiscreet babble of friends, he managed to build and despatch the *Florida*, *Alabama*, and other vessels, with results with which the world is familiar. Their work began the decadence of American commerce, and the heavy bill of damages they caused against England at Geneva represents but a small portion of the loss, one way or another, attributable to them.

With that promptitude which characterized all of Captain Bulloch's work, and which was largely the secret of its success, he caused the keel of the *Oreto* (afterward the *Florida*) to be laid in the same month in which he arrived in England, and even before his first remittances had arrived from home. The same energy led to the building of the *Alabama* a few months later, and was evidenced again in the prompt despatch of this latter ship on a pretended further trial-trip, when the author had received information, "from a private but most reliable source, that it would not be safe to leave the ship in Liverpool another forty-eight hours." And as an example of Captain Bulloch's restless activity, we find that while awaiting the completion of the *Florida* and *Alabama*, he bought and took home to the South, through the Savannah blockade, with a cargo of army supplies, the steamer *Fingal*, which was afterward altered into the ironclad ram *Atlanta*, and suffered capture a year or two later, in a brief engagement under the guns of the monitors *Passaic* and *Nahant*. One object of this incidental trip was to obtain opportunity for conference with the naval authorities at Richmond. On her way out, the *Fingal* met the Confederate steamer *Nashville* at Bermuda, the latter being then bound for England, where she created so much talk and stir, and whence she departed home unexpectedly, before her officers and crew could be transferred to the *Florida*, as was intended.

The successful career of the *Alabama* and *Florida* illustrates the skill and foresight with which they were designed. It was apparent that, to keep the sea effectively, they must be capable of speed under sail alone, and dependent on their auxiliary steam power only in emergency. The various foreign nations had early proclaimed rules of neutrality intended to restrict the use of their ports by vessels of either belligerent, particularly in the matter of supplies of coal, and the home ports of the Southern vessels were in effect sealed against them by the blockade. Hence the two ships in question were built with fine lines for speed, and carried exceptional spread of canvas, especially in their fore and aft sails. Their chief cruising was done under sail alone, and they made a port only at long intervals, while their operations against the merchant-ships were carried on at times almost under the guns of the enemy. On this point Captain Bulloch remarks that he has always thought

"that the United States Navy Department showed either great apathy or was singularly blind to the real danger to the commerce of the United States, and strangely negligent in using the means to protect it. The points of attack were so apparent that it seems hardly credible that they were never occupied."

After describing in detail the course of American vessels between their home ports and those of the east and west coasts of South America, the Cape of Good Hope, and the East Indies, and showing that to catch the northeast and southeast trade-winds effectively they must pass near Fernando de Noronha, when about crossing the Atlantic equator, Captain Bulloch continues:

"If the United States had stationed a few ships to cruise in couplets in the neighborhood of the above-named 'forks of the road,' as they have been called by Maury, and a few more, say, in the Straits of Malacca, and on the principal and well-known cruising-ground of their whaling fleet, two or three Confederate cruisers could not have remained for weeks in the track of passing ships, capturing and destroying them without hindrance. Neither the *Alabama*, *Florida*, nor *Sumter* was driven from her work in any particular latitude; they shifted their cruising-grounds only when it seemed advisable to seek fresh victims elsewhere; and the *Shenandoah* went round the world, sought out the great American whaling-fleet in the North Pacific, and destroyed thirty eight vessels without so much as seeing a man-of-war."

The Navy Department did send out the steamer *Vanderbilt* and other vessels with instructions to cruise over nearly the same route that Captain Bulloch indicates, and it would appear to have been in some degree a matter of luck that the commerce-destroyers so long escaped an encounter. Professor Soley, in commenting upon the judicious instructions given to the commander of the *Vanderbilt* on this occasion, says that they were defeated by Captain Wilkes, who annexed that vessel to his flying squadron, and refused to give her up until peremptory orders had been issued from the Department, thus delaying her until the birds had flown and her plans proved abortive.

Of the midnight surprise and capture of the *Florida* by the *Wachusett*, under Captain Collins, in the neutral port of Bahia, Captain Bulloch speaks in strong terms, characterizing it as an act of "assassination." The *Kearsarge's* duel with and victory over the *Alabama* off Cherbourg was a different matter, and recalls the chivalric challenges and combats of the older school of naval warriors. The story of the famous fight of June 11, 1864, is retold freshly and with great fairness by Captain Bulloch. He finds, in brief, that "the result of the action was determined by the superior accuracy of the firing of the *Kearsarge*," and, in common with other reasonable people, holds that Captain Winslow's protection of his ship by hanging her chain-cables outboard over the more vulnerable parts was a sensible performance, notwithstanding the strictures this circumstance provoked—chiefly among Southerners—at the time. The well-known fact of the *unexploded* shell from the *Alabama*, which lodged in the *Kearsarge's* most vital parts—the sternpost, near the screw, rudder, and wood-

ends—early in the action, is worth recalling, as a curious example of what minute chances success sometimes turns upon in warfare. Concerning the much-discussed attitude of the English yacht *Deerhound*, in carrying off and landing in England some of the *Alabama's* crew and officers from the sinking ship, Captain Bulloch fails to note the important fact pointed out by Professor Soley, that before the *Deerhound* intervened, she was hailed from the *Kearsarge* and asked to assist in taking off the *Alabama's* people. This latter authority, in a review of the case, concludes that the *Kearsarge* had no right, under these circumstances, to expect that the *Deerhound* would deliver up the rescued men into imprisonment, and fails to see how any blame can be imputed to her owner in the premises.

We have thus far chiefly confined our attention (with many omissions) to Captain Bulloch's operations in England, but his chapters concerning the attempts to build and despatch vessels in France possess equal interest, particularly for their nearly positive evidence that no less a person than the Emperor himself, at one time, smiled upon and fostered these efforts. But that exalted personage was not unpractised in the methods of shifty diplomacy, and could, on occasion, with equal facility, blow either hot or cold. It appears that, early in 1863, the Confederate authorities had received intimation from high officials in France that facilities would be offered for the construction and equipment of ironclad ships-of-war in that country, and that this intimation was of a sufficiently formal character to induce the passage of a secret act, by the Confederate Congress, appropriating £2,000,000 for this purpose. These facts were communicated to Captain Bulloch, in a cipher despatch, by the hand of a special messenger, under date of May 6 of that year; from which, by the way, it appears that Secretary Mallory not only felt sure of his ground in constructing these ships, but even supposed it possible that "one or more of the ironclads of the French navy might be so transferred" as to come into Confederate possession.

Before the receipt of these advices, however, Captain Bulloch, having himself received intimations from France of somewhat similar character, was already in treaty with a French shipbuilder for the construction of suitable vessels. This was a M. Arman, who, then engaged in building large armored vessels for the imperial navy at his Bordeaux yard, where he had been recently personally decorated by the Emperor, was a deputy in the Corps Législatif, and, as it appears, possessed of facilities for obtaining personal interviews, on occasion, not only with M. Rouher, the Minister of State, but with his Imperial Majesty himself. On M. Arman's assurance that he was "confidentially informed by the Minister of State that the Emperor was willing for him to undertake the construction of ships for the Confederate Government," and to let them go to sea under the French flag, for delivery at any desired point, Captain Bulloch ordered a formidable fleet of four clipper corvettes of twelve or fourteen six-inch rifle-guns each, and two ironclads of large power. What these effective vessels might have accomplished on the Northern coast, in the hands of the daring Confederate officers who were awaiting their completion, and how much they might have delayed the march of events in the then waning fortunes of the South, it is idle now to discuss. Whether it was bad news from Bazaine in Mexico, or Lee's shattered recoil from Gettysburg, that suggested a more cautious consideration of the protest from the United States, by that time lodged against these vessels, we shall perhaps never know; but this much is clear, that when Mr. Dayton, the American Minister presented his complaint, the shipbuilders concerned were sent for and informed, with fine official indignation, that their plans must forthwith be abandoned.

M. Arman, indeed, was treated to a personal interview with the Emperor, who "soundly rated" him, and, threatening imprisonment in the event of further dealings with the Confederates, dismissed him to such loss as his suddenly aborted transactions might involve. That the purpose of these vessels was fully known to the Emperor and his ministers, and their building connived at, admits of little doubt. Formal official authority to arm the ships had been duly furnished to the builders by the Minister of Marine, this functionary (M. Chasseloup-Laubat) writing under his official signature to M. Arman, under date of June 6, 1863, in reference to the corvettes, as follows:

"Je m'empresse de vous faire connaître . . . que je vous autorise volontiers à pourvoir d'un armement de douze à quatorze canons de trente les quatre bâtiments à vapeur, en bois et en fer, qui se construisent en ce moment à Bordeaux et à Nantes. Je vous prie de vouloir bien m'informer en temps utile de l'époque à laquelle ces navires seront prêts à prendre la mer, afin que je donne les instructions nécessaires à MM. les chefs du service de la Marine dans ces deux ports."

To this evidence may be added, as a bit of interesting history not generally known (or, indeed, known to Captain Bulloch, perhaps), the fact that the official records of the Richmond Government on this subject, including such papers as Mr. Slidell, their representative in France, had obtained from the imperial officials, were solemnly destroyed in the furnace of the Mint at Charlotte, North Carolina, on the retreat from Richmond of Mr. Davis and his Cabinet. And it was observed by such of these Confederate officials as were soon after captured and imprisoned, that one of the chief matters of inquiry directed to them by Mr. Seward was the French encouragement in the naval operations here referred to. It is said by Southerners in the confidence of these officials, that the reason for the detention of Mr. Mallory at Fort Lafayette (the last Confederate prisoner except Mr. Davis himself) was Mr. Seward's confident belief that he could produce these papers, which were then very much desired at the State Department in Washington, for use against the Emperor of the French in the matter of dislodging Maximilian from Mexico.

In construction Captain Bulloch's book is defective. The practice of following out each subject to its conclusion, without considering it in its relation to others, leads to much repetition, and, in consequence, to unnecessary length. But in discussing the events of the war, the work is conspicuously fair—there being, indeed, a somewhat over-punctiliousness at times in the effort to do justice—and it is uniformly interesting. The absence of an index seriously detracts from the usefulness of a book of this character for purposes of reference, but as a whole it constitutes a decidedly valuable contribution not only to naval history generally, but to the full history of the civil war.
